Draft Version

1 About This Document

1.1 Purpose and Scope

This document describes the features, logical structures, functions, operating modes, and related registers of each module about D1. For details about the interface timings and related parameters, the pins, pin usages, performance parameters, and package dimension, please refer to the [D1_Datasheet](#).

1.2 Intended Audience

The document is intended for:

- Design and maintenance personnel for electronics
- Programmers in writing code or modifying the Allwinner provided code

1.3 Symbol Conventions

1.3.1 Symbol Conventions

The symbols that may be found in this document are defined as follows.

| Symbol | Description |
|--|--|
|  WARNING | Indicates potential risk of injury or death exists if the instructions are not obeyed. |
|  CAUTION | Indicates potential risk of equipment damage, data loss, performance degradation, or unexpected results exists if the instructions are not obeyed. |
|  NOTE | Provides additional information to emphasize or supplement important points of the main text. |

1.3.2 Table Content Conventions

The table content conventions that may be found in this document are defined as follows.

| Symbol | Description |
|--------|--------------------|
| / | The cell is blank. |

1.3.3 Reset Value Conventions

In the register definition tables:

If other column value in a bit or multiple bits row is “/”, that this bit or these multiple bits are unused.

If the default value of a bit or multiple bits is “UDF”, that the default value is undefined.

1.3.4 Register Attributes

The register attributes that may be found in this document are defined as follows.

| Symbol | Description |
|--------|---|
| R | Read Only |
| R/W | Read/Write |
| R/WAC | Read/Write-Automatic-Clear, clear the bit automatically when the operation of complete. Writing 0 has no effect |
| R/WC | Read/Write-Clear |
| R/W0C | Read/Write 0 to Clear. Writing 1 has no effect |
| R/W1C | Read/Write 1 to Clear. Writing 0 has no effect |
| R/W1S | Read/Write 1 to Set. Writing 0 has no effect |
| W | Write Only |

1.3.5 Numerical System

The expressions of data capacity, frequency, and data rate are described as follows.

| Type | Symbol | Value |
|----------------------|--------|---------------|
| Data capacity | 1 K | 1024 |
| | 1 M | 1,048,576 |
| | 1 G | 1,073,741,824 |
| Frequency, data rate | 1 k | 1000 |
| | 1 M | 1,000,000 |
| | 1 G | 1,000,000,000 |

The expressions of addresses and data are described as follows.

| Symbol | Example | Description |
|--------|---------------------|--|
| 0x | 0x0200, 0x79 | Address or data in hexadecimal |
| 0b | 0b010, 0b00 000 111 | Data or sequence in binary (register description is excluded.) |
| X | 00X, XX1 | In data expression, X indicates 0 or 1. For example, 00X indicates 000 or 001 and XX1 indicates 001, 011, 101 or 111. |

2 Product Description

2.1 Overview

D1 is an advanced application processor designed for RISC-V Multi-Media decoding platform. It integrates a 64-bit XuanTie C906 RISC-V CPU and a HiFi4 DSP to provide the high-efficient computing power. D1 supports full format decoding such as H.265, H.264, MPEG-1/2/4, JPEG, VC1, and so on. The independent encoder can encode in JPEG or MJPEG. Integrated multi ADCs/DACs and I2S/PCM/DMIC/OWA audio interfaces can work seamlessly with the CPU to accelerate multimedia algorithms and improve the user experience. D1 supports RGB/LVDS/MIPI DSI/HDMI/CVBS OUT display output interfaces to meet the requirements of the different screen display. D1 comes with extensive connectivity and interfaces, such as USB, SDIO, EMAC, TWI, UART, SPI, PWM, GPADC, LRADC, TPADC, IR TX&RX, and so on. Besides, D1 can connect with other different peripherals like WiFi and BT via SDIO and UART.

2.2 Features

2.2.1 CPU Architecture

- XuanTie C906 RISC-V CPU
- 32 KB I-cache + 32 KB D-cache

2.2.2 DSP Architecture

- HiFi4
- 32 KB L1 I-cache and 32 KB L1 D-cache
- 64 KB I-ram and 64 KB D-ram

2.2.3 Memory SubSystem

2.2.3.1 Boot ROM (BROM)

- On-chip memory
- Supports system boot from the following devices:

- SD card
- eMMC
- SPI NOR Flash
- SPI NAND Flash
- Supports mandatory upgrade process through USB and SD card
- Supports GPIO pin and eFuse module to select the boot media type

2.2.3.2 SDRAM

- Supports DDR2/DDR3 SDRAM
- Maximum capacity up to 2 GB
- Supports clock frequency up to 533 MHz for DDR2
- Supports clock frequency up to 800 MHz for DDR3

2.2.3.3 SMHC

- Three SD/MMC host controller (SMHC) interfaces
- The SMHC0 controls the devices that comply with the protocol Secure Digital Memory (SD mem-version 3.0)
- The SMHC1 controls the device that complies with the protocol Secure Digital I/O (SDIO-version 3.0)
- The SMHC2 controls the device that complies with the protocol Multimedia Card (eMMC-version 5.0)
- Maximum performance:
 - SDR mode 150 MHz@1.8 V IO pad
 - DDR mode 100 MHz@1.8 V IO pad
 - DDR mode 50 MHz@3.3 V IO pad
- Supports 1-bit or 4-bit data width
- Supports block size of 1 to 65535 bytes
- Internal 1024-Bytes RX FIFO and 1024-Bytes TX FIFO
- Supports card insertion and removal interrupt
- Supports hardware CRC generation and error detection

- Supports descriptor-based internal DMA controller

2.2.4 Video Engine

- Video decoding
 - H.265 MP@L5.0 up to 4K@30fps or 1080p@60fps
 - H.264 BP/MP/HP@L5.0 up to 4K@24fps or 1080p@60fps
 - H.263 BP up to 1080p@60fps
 - MPEG-4 SP/ASP L5 up to 1080p@60fps
 - MPEG-2 MP/HL up to 1080p@60fps
 - MPEG-1 MP/HL up to 1080p@60fps
 - Xvid up to 1080p@60fps
 - Sorenson Spark up to 1080p@60fps
 - WMV9/VC-1 SP/MP/AP up to 1080p@60fps
 - MJPEG up to 1080p@30fps
- Video encoding
 - JPEG/MJPEG up to 1080p@60fps
 - Supports input picture scaler up/down

2.2.5 Video and Graphics

2.2.5.1 Display Engine (DE)

- Output size up to 2048 x 2048
- Supports two alpha blending channels for main display and one channel for aux display
- Supports four overlay layers in each channel, and has an independent scaler
- Supports potter-duff compatible blending operation
- Supports LBC buffer decoder
- Supports dither output to TCON
- Supports input format Semi-planar YUV422/YUV420/YUV411 and Planar YUV422/YUV420/YUV411, ARGB8888/XRGB8888/RGB888/ARGB4444/ARGB1555/RGB565/palette
- Supports SmartColor2.0 for excellent display experience

- Adaptive detail/edge enhancement
- Adaptive color enhancement
- Adaptive contrast enhancement and fresh tone rectify

- Supports write back for aux display

2.2.5.2 De-interlacer (DI)

- Supports YUV420 (Planar/NV12/NV21) and YUV422 (Planar/NV16/NV61) data format
- Support video resolution from 32x32 to 2048x1280 pixel
- Support Inter-field interpolation/motion adaptive de-interlace method
- Performance: module clock 600M for 1080p@60Hz YUV420

2.2.5.3 Graphic 2D (G2D)

- Supports layer size up to 2048 x 2048 pixels
- Supports pre-multiply alpha image data
- Supports color key
- Supports two pipes Porter-Duff alpha blending
- Supports multiple video formats 4:2:0, 4:2:2, 4:1:1 and multiple pixel formats (8/16/24/32 bits graphics layer)
- Supports memory scan order option
- Supports any format convert function
- Supports 1/16× to 32× resize ratio
- Supports 32-phase 8-tap horizontal anti-alias filter and 32-phase 4-tap vertical anti-alias filter
- Supports window clip
- Supports FillRectangle, BitBlit, StretchBlit and MaskBlit
- Supports horizontal and vertical flip, clockwise 0/90/180/270 degree rotate for normal buffer
- Supports horizontal flip, clockwise 0/90/270 degree rotate for LBC buffer

2.2.6 Video Output

2.2.6.1 RGB and LVDS LCD

- Supports RGB interface with DE/SYNC mode, up to 1920 x 1080@60fps
- Supports serial RGB/dummy RGB interface, up to 800 x 480@60fps
- Supports LVDS interface with dual link, up to 1920 x 1080@60fps
- Supports LVDS interface with single link, up to 1366 x 768@60fps
- Supports i8080 interface, up to 800 x 480@60fps
- Supports BT656 interface for NTSC and PAL
- RGB888, RGB666 and RGB565 with dither function
- Gamma correction with R/G/B channel independence

2.2.6.2 MIPI DSI

- Compliance with MIPI DSI v1.01
- Supports 4-lane MIPI DSI, up to 1280 x 720@60fps and 1920 x 1200@60fps resolution
- Supports non-burst mode with sync pulse/sync event, burst mode and command mode
- Supports pixel format: RGB888, RGB666, RGB666 loosely packed and RGB565
- Supports continuous and non-continuous lane clock modes
- Supports bidirectional communication of all generic commands in LP through data lane 0
- Supports low power data transmission
- Supports ULPS and escape modes
- Hardware checksum capabilities

2.2.6.3 HDMI

- Compatible with HDMI 2.0
- Supports DDC and SCDC
- Integrated CEC hardware engine
- Optional color space converter (CSC): RGB (4:4:4) to/from YCbCr (4:4:4 or 4:2:2)

- Video formats:
 - All CEA-861-E video formats up to 1080p at 60 Hz and 720p/1080i at 120 Hz
 - Optional HDMI 1.4b video formats
 - All CEA-861-E video formats up to 1080p at 120 Hz
 - HDMI 1.4b 4K x 2K video formats
 - HDMI 1.4b 3D video modes with up to 340 MHz (TMDS clock)
 - Optional HDMI 2.0 video formats
 - All CEA-861-F video formats
 - Dynamic Range and Mastering InfoFrame (DRM, packet header 0x87)
- Audio formats:
 - Uncompressed audio formats: IEC60985 L-PCM audio samples, up to 192 kHz
 - Compressed audio formats: IEC61937 compressed audio, up to 1536 kHz (for HDMI 2.0b)/768 kHz (for HDMI 1.4b)

2.2.6.4 CVBS OUT

- 1-channel CVBS output
- Supports NTSC and PAL format
- Plug status auto detecting
- 10 bits DAC output

2.2.7 Video Input

2.2.7.1 Parallel CSI

- Supports 8-bit digital camera interface (RAW8/YUV422/YUV420)
- Supports BT656, BT601 interface (YUV422)
- Supports ITU-R BT.656 time-multiplexed format up to 2*1080p@30fps in DDR sample mode

- Maximum pixel clock of 148.5 MHz
- Supports de-interlacing for interlace video input
- Supports conversion from YUV422 to YUV420, YUV422 to YUV400, YUV420 to YUV400
- Supports horizontal and vertical flip

2.2.7.2 CVBS IN

- 2-channel CVBS input and 1-channel CVBS decoder
- Supports NTSC and PAL format
- Supports YUV422/YUV420 format
- With 1 channel 3D comb filter
- Detection for signal locked and 625 lines
- Programmable brightness, contrast, and saturation
- 10-bit video ADCs

2.2.8 System Peripherals

2.2.8.1 Timer

- The timer module implements the timing and counting functions, which includes timer0, timer1, watchdog, and audio video synchronization (AVS)
- The timer0/timer1 is a 32-bit down counter. The timer0 and timer1 are completely consistent
- The watchdog is used to transmit a reset signal to reset the entire system when an exception occurs in the system
- The AVS is used to synchronize the audio and video. The AVS sub-block includes AVS0 and AVS1, which are completely consistent

2.2.8.2 High Speed Timer (HSTimer)

- The HSTimer module consists of HSTimer0 and HSTimer1. HSTimer0 and HSTimer1 are down counters that implement timing and counting functions. They are completely consistent.
- Configurable 56-bit down timer

- Supports 5 prescale factors
- The clock source is synchronized with AHB0 clock, much more accurate than other timers
- Supports 2 working modes: periodic mode and single counting mode
- Generates an interrupt when the count is decreased to 0

2.2.8.3 Platform-Level Interrupt Controller (PLIC)

- Sampling, priority arbitration and distribution for external interrupt sources
- The interrupt can be configured as machine mode and super user mode
- Up to 256 interrupt source sampling, supporting level interrupt and pulse interrupt
- 32 levels of interrupt priority
- Maintains independently the interrupt enable for each interrupt mode (machine/super user)
- Maintains independently the interrupt threshold for each interrupt mode (machine/super user)
- Configurable access permission for PLIC registers

2.2.8.4 DMAC

- Up to 16-ch DMA
- Provides 32 peripheral DMA requests for data reading and 32 peripheral DMA requests for data writing
- Flexible data width of 8/16/32/64-bit
- Programmable DMA burst length
- Supports linear and IO address modes
- Supports data transfer types with memory-to-memory, memory-to-peripheral, peripheral-to-memory, peripheral-to-peripheral
- Supports transfer with linked list
- DRQ response includes waiting mode and handshake mode
- DMA channel supports pause function
- Memory devices support non-aligned transform

2.2.8.5 Clock Controller Unit (CCU)

- 8 PLLs
- One on-chip RC oscillator
- Supports one external 24 MHz DCXO and one external 32.768 kHz oscillator
- Supports clock configuration and clock generation for corresponding modules
- Supports software-controlled clock gating and software-controlled reset for corresponding modules

2.2.8.6 Thermal Sensor Controller (THS)

- One thermal sensor located in CPU
- Temperature accuracy: $\pm 3^{\circ}\text{C}$ from 0°C to $+100^{\circ}\text{C}$, $\pm 5^{\circ}\text{C}$ from -25°C to $+125^{\circ}\text{C}$
- Averaging filter for thermal sensor reading
- Supports over-temperature protection interrupt and over-temperature alarm interrupt

2.2.8.7 LDO Power

- Integrated 2 LDOs (LDOA, LDOB)
- LDOA: 1.8 V power output, LDOB: 1.35 V/1.5 V/1.8 V power output
- LDOA for IO and analog module, LDOB for SDRAM
- Input voltage is 2.4 V to 3.6 V

2.2.8.8 RTC

- Implements time counter and timing wakeup
- Provides a 16-bit counter for counting day, 5-bit counter for counting hour, 6-bit counter for counting minute, 6-bit counter for counting second
- External connect a 32.768 kHz low-frequency oscillator for count clock
- Timer frequency is 1 kHz
- Configurable initial value by software anytime
- Supports timing alarm, and generates interrupt and wakeup the external devices

- 8 general purpose registers for storing power-off information

2.2.8.9 Reset

- Integrated internal reset
- Reset D1 or other IC

2.2.9 Audio Interfaces

2.2.9.1 Audio Codec

- Two audio digital-to-analog (DAC) channels
 - Supports 16-bit and 20-bit sample resolution
 - 8 kHz to 192 kHz DAC sample rate
 - 100 ± 2 dB SNR@A-weight, -85 ± 3 dB THD+N
- Two audio outputs:
 - One stereo headphone output: HPOUTL/R
 - One stereo differential lineout output: LINEOUTLP/N and LINEOUTRP/N
- Three audio analog-to-digital (ADC) channels
 - Supports 16-bit and 20-bit sample resolution
 - 8 kHz to 48 kHz ADC sample rate
 - 95 ± 3 dB SNR@A-weight, -80 ± 3 dB THD+N
- Five audio inputs:
 - Three differential microphone inputs: MICIN1P/1N, MICIN2P/2N, MICIN3P/3N
 - One stereo LINEIN input: LINEINL/R
 - One stereo FMIN input: FMINL/R
- Stereo headphone driver
 - 95 ± 3 dB SNR@A-weight
 - Output Level $0.55 V_{rms}@10 k\Omega/THD+N -77 \pm 3$ dB, $0.37 V_{rms}@16 \Omega/THD+N -40$ dB
- Supports Dynamic Range Controller adjusting the DAC playback and ADC recording
- One 128x20-bits FIFO for DAC data transmit, one 128x20-bits FIFO for ADC data receive
- Programmable FIFO thresholds

- Supports interrupts and DMA

2.2.9.2 I2S/PCM

- Three I2S/PCM external interfaces (I2S0, I2S1, I2S2) for connecting external power amplifier and MIC ADC
- Compliant with standard Philips Inter-IC sound (I2S) bus specification
 - Left-justified, Right-justified, PCM mode, and Time Division Multiplexing (TDM) format
 - Programmable PCM frame width: 1 BCLK width (short frame) and 2 BCLKs width (long frame)
- Transmit and Receive data FIFOs
 - Programmable FIFO thresholds
 - 128 depth x 32-bit width TXFIFO and 64 depth x 32-bit width RXFIFO
- Supports multiple function clock
 - Clock up to 24.576 MHz Data Output of I2S/PCM in Master mode (Only if the IO PAD and Peripheral I2S/PCM satisfy Timing Parameters)
 - Clock up to 12.288 MHz Data Input of I2S/PCM in Master mode
- Supports TX/RX DMA slave interface
- Supports multiple application scenarios
 - Up to 16 channels ($f_s = 48$ kHz) which has adjustable width from 8-bit to 32-bit
 - Sample rate from 8 kHz to 384 kHz (CHAN = 2)
 - 8-bit u-law and 8-bit A-law companded sample
- Supports master/slave mode

2.2.9.3 DMIC

- Supports maximum 8 digital PDM microphones
- Supports sample rate from 8 kHz to 48 kHz

2.2.9.4 One Wire Audio (OWA)

- One OWA TX and one OWA RX
- Compliance with S/PDIF interface

- IEC-60958 and IEC-61937 transmitter and receiver functionality
 - IEC-60958 supports 16-bit, 20-bit, and 24-bit data formats
 - IEC-61937 uses the IEC-60958 series for the conveying of non-linear PCM bit streams, each sub-frame transmits 16-bit
- TXFIFO and RXFIFO
 - One 128×24bits TXFIFO and one 64×24bits RXFIFO for audio data transfer
 - Programmable FIFO thresholds
- Supports TX/RX DMA slave interface
- Supports multiple function clock
 - Separate clock for OWA TX and OWA RX
 - The clock of TX function includes 24.576 MHz and 22.579 MHz frequency
 - The clock of RX function includes 24.576*8MHz frequency
- Supports hardware parity on TX/RX
 - Hardware parity checking on the receiver
 - Hardware parity generation on the transmitter
- Supports channel status capture on the receiver
- Supports channel sample rate capture on the receiver
- Supports insertion detection for the receiver
- Supports channel status insertion for the transmitter
- Supports interrupts and DMA

2.2.10 Security System

2.2.10.1 Crypto Engine (CE)

- Supports Symmetrical algorithm for encryption and decryption: AES, DES, TDES
 - Supports ECB, CBC, CTS, CTR, CFB, OFB mode for AES
 - Supports 128/192/256-bit key for AES
 - Supports ECB, CBC, CTR mode for DES/TDES
- Supports Hash algorithm for tamper proofing: MD5, SHA, HMAC
 - Supports SHA1, SHA224, SHA256, SHA384, SHA512 for SHA

- Supports HMAC-SHA1, HMAC-SHA256 for HMAC
- Supports multi-package mode for MD5/SHA1/SHA224/SHA256/SHA384/SHA512
- Supports Asymmetrical algorithm for signature verification: RSA
 - RSA supports 512/1024/2048-bit width
- Supports 160-bit hardware PRNG with 175-bit seed
- Supports 256-bit hardware TRNG
- Internal DMA controller for data transfer with memory

2.2.10.2 Security ID (SID)

- Supports 2 Kbits eFuse
- Backup eFuse information by using SID_SRAM
- Burning the key to the SID
- Reading the key use status in the SID
- Loading the key to the CE

2.2.11 External Peripherals

2.2.11.1 USB DRD

- One USB 2.0 DRD (USB0), with integrated USB 2.0 analog PHY
- Complies with USB2.0 Specification
- Supports USB Host function
 - Compatible with Enhanced Host Controller Interface (EHCI) Specification, Version 1.0
 - Compatible with Open Host Controller Interface (OHCI) Specification, Version 1.0a
 - Supports High-Speed (HS, 480 Mbit/s), Full-Speed (FS, 12 Mbit/s), and Low-Speed (LS, 1.5 Mbit/s)
 - Supports only 1 USB Root port shared between EHCI and OHCI
- Supports USB Device function
 - Supports High-Speed (HS, 480 Mbit/s) and Full-Speed (FS, 12 Mbit/s)
 - Supports bi-directional endpoint0 (EP0) for Control transfer

- Up to 10 user-configurable endpoints (EP1+, EP1-, EP2+, EP2-, EP3+, EP3-, EP4+, EP4-, EP5+, EP5-) for Bulk transfer, Isochronous transfer and Interrupt transfer
- Up to (8 KB + 64 Bytes) FIFO for all EPs (including EP0)
- Supports interface to an external Normal DMA controller for every EP
- Supports an internal DMA controller for data transfer with memory
- Supports High-Bandwidth Isochronous & Interrupt transfers
- Automated splitting/combining of packets for Bulk transfers
- Supports point-to-point and point-to-multipoint transfer in both Host and Peripheral modes
- Includes automatic ping capabilities
- Soft connect/disconnect function
- Performs all transaction scheduling in hardware
- Power optimization and power management capabilities
- Device and host controller share a 8K SRAM and a physical PHY

2.2.11.2 USB HOST

- One USB 2.0 HOST (USB1), with integrated USB 2.0 analog PHY
- Complies with USB2.0 Specification
- Supports USB2.0 Host function
 - Compatible with Enhanced Host Controller Interface (EHCI) Specification, Version 1.0
 - Compatible with Open Host Controller Interface (OHCI) Specification, Version 1.0a
 - Supports High-Speed (HS, 480 Mbit/s), Full-Speed (FS, 12 Mbit/s) and Low-Speed (LS, 1.5 Mbit/s) Device
 - Supports only 1 USB Root port shared between EHCI and OHCI
- An internal DMA Controller for data transfer with memory

2.2.11.3 EMAC

- One EMAC interface for connecting external Ethernet PHY
- 10/100/1000 Mbit/s Ethernet port with RGMII and RMII interfaces

- Compliant with IEEE 802.3-2002 standard
- Supports both full-duplex and half-duplex operation
- Provides the management data input/output (MDIO) interface for PHY device configuration and management with configurable clock frequencies
- Programmable frame length to support Standard or Jumbo Ethernet frames with sizes up to 16 KB
- Supports a variety of flexible address filtering modes
- Separate 32-bit status returned for transmission and reception packets
- Optimization for packet-oriented DMA transfers with frame delimiters
 - Supports linked-list descriptor list structure
 - Descriptor architecture, allowing large blocks of data transfer with minimum CPU intervention; each descriptor can transfer up to 4 KB of data
 - Comprehensive status reporting for normal operation and transfers with errors
- 4 KB TXFIFO for transmission packets and 16 KB RXFIFO for reception packets
- Programmable interrupt options for different operational conditions

2.2.11.4 UART

- Up to 6 UART controllers (UART0, UART1, UART2, UART3, UART4, UART5)
- UART0, UART4, UART5: 2-wire; UART1, UART2, UART3: 4-wire
- Compatible with industry-standard 16450/16550 UARTs
- Supports IrDA-compatible slow infrared (SIR) format
- Two separate FIFOs: one is RX FIFO, and the other is TX FIFO
 - Each of them is 64 bytes (For UART0)
 - Each of them is 256 bytes (For UART1, UART2, UART3, UART4, and UART5)
- The working reference clock is from the APB bus clock
 - Speed up to 4 Mbit/s with 64 MHz APB clock
 - Speed up to 1.5 Mbit/s with 24 MHz APB clock
- 5 to 8 data bits for RS-232 characters, or 9 bits RS-485 format
- 1, 1.5 or 2 stop bits
- Programmable parity (even, odd, or no parity)

- Supports TX/RX DMA slave controller interface
- Supports software/hardware flow control
- Supports RX DMA Master interface (Only for UART1)
- Supports auto-flow by using CTS & RTS (Only for UART1/2/3)

2.2.11.5 Two Wire Interface (TWI)

- Up to 4 TWI controllers (TWI0, TWI1, TWI2, TWI3)
- Compliant with I2C bus standard
- Supports standard mode (up to 100 kbit/s) and fast mode (up to 400 kbit/s)
- Supports 7-bit and 10-bit device addressing modes
- Supports master mode or slave mode
- Master mode features:
 - Supports the bus arbitration in the case of multiple master devices
 - Supports clock synchronization and bit and byte waiting
 - Supports packet transmission and DMA
- Slave mode features:
 - Interrupt on address detection
- The TWI controller includes one TWI engine and one TWI driver. And the TWI driver supports packet transmission and DMA mode when TWI works in master mode

2.2.11.6 SPI and SPI_DBI

- Up to 2 SPI controllers (SPI0, SPI1)
- The SPI0 only supports SPI mode; The SPI1 supports SPI mode and display bus interface (DBI) mode
- SPI mode:
 - Full-duplex synchronous serial interface
 - Master/slave configurable
 - Mode0 to Mode3 are supported for both transmit and receive operations
 - 8-bit wide by 64-entry FIFO for both transmit and receive data

- Polarity and phase of the Chip Select (SPI-CS) and SPI Clock (SPI-CLK) are configurable
- Supports 3-wire/4-wire SPI
- Supports programmable serial data frame length: 1-bit to 32-bit
- Supports Standard SPI, Dual-Output/Dual-Input SPI, Dual IO SPI, Quad-Output/Quad-Input SPI
- DBI mode:
 - Supports DBI Type C 3 Line/4 Line Interface Mode
 - Supports 2 Data Lane Interface Mode
 - Supports RGB111/444/565/666/888 video format
 - Maximum resolution of RGB666 240 x 320@30Hz with single data lane
 - Maximum resolution of RGB888 240 x 320@60Hz or 320 x 480@30Hz with dual data lane
 - Supports Tearing effect
 - Supports software flexible control video frame rate

2.2.11.7 CIR Receiver (CIR_RX)

- One CIR_RX interface (IR-RX)
- Full physical layer implementation
- Supports NEC format infra data
- Supports CIR for remote control or wireless keyboard
- 64x8 bits FIFO for data buffer
- Sample clock up to 1 MHz

2.2.11.8 CIR Transmitter (CIR_TX)

- One CIR_TX interface (IR-TX)
- Supports arbitrary wave generator
- Configurable carrier frequency
- Supports handshake mode and waiting mode of DMA
- 128 bytes FIFO for data buffer

2.2.11.9 PWM

- Supports 8 independent PWM channels (PWM0 to PWM7)
 - Supports PWM continuous mode output
 - Supports PWM pulse mode output, and the pulse number is configurable
 - Output frequency range: 0 to 24 MHz or 100 MHz
 - Various duty-cycle: 0% to 100%
 - Minimum resolution: 1/65536
- Supports 4 complementary pairs output
 - PWM01 pair (PWM0 + PWM1), PWM23 pair (PWM2 + PWM3), PWM45 pair (PWM4 + PWM5), PWM67 pair (PWM6 + PWM7)
 - Supports dead-zone generator, and the dead-zone time is configurable
- Supports 4 group of PWM channel output for controlling stepping motors
 - Supports any plural channels to form a group, and output the same duty-cycle pulse
 - In group mode, the relative phase of the output waveform for each channel is configurable
- Supports 8 channels capture input
 - Supports rising edge detection and falling edge detection for input waveform pulse
 - Supports pulse-width measurement for input waveform pulse

2.2.11.10 General Purpose ADC (GPADC)

- 2-ch Successive approximation register (SAR) analog-to-digital converter (ADC)
- 12-bit sampling resolution and 8-bit precision
- 64 FIFO depth of data register
- Power reference voltage: AVCC, analog input voltage range: 0 to AVCC
- Maximum sampling frequency up to 1 MHz
- Supports three operation modes: single conversion mode, continuous conversion mode, burst conversion mode

2.2.11.11 Touch Panel ADC (TPADC)

- 12 bit SAR type A/D converter
- Configurable sample frequency up to 750 kHz
- One 32x12 FIFO for storing A/D conversion result
- Supports DMA slave interface
- Supports 4-wire resistive touch panel input detection
 - Supports pen down detection with programmable sensitivity
 - Supports single touch coordinate measurement
 - Supports dual touch detection
 - Supports touch pressure measurement with programmable threshold
 - Supports median and averaging filter for noise reduction
 - Supports X and Y coordinate exchange function
- Supports Aux ADC with up to 4 channels

2.2.11.12 Low Rate ADC (LRADC)

- One LRADC input channel
- 6-bit sampling resolution and 5-bit precision
- Sample rate up to 2 kHz
- Supports hold Key and general Key
- Supports normal, continuous and single working mode
- Power supply voltage: AVCC, power reference voltage: $0.75 \cdot AVCC$, analog input and detected voltage range: 0 to 1.266 V

2.2.11.13 LEDC

- LEDC is used to control the external intelligent control LED lamp
- Configurable LED output high/low level width
- Configurable LED reset time
- LEDC data supports DMA configuration mode and CPU configuration mode

- Maximum 1024 LEDs serial connect
- LED data transfer rate up to 800 kbit/s

2.2.12 Package

- LFBGA 337 balls, 13 mm x 13 mm body size, 0.65 mm ball pitch, 0.35 mm ball size

2.3 Block Diagram

Figure 2-1 shows the system block diagram of the D1.

Figure 2-1 D1 System Block Diagram

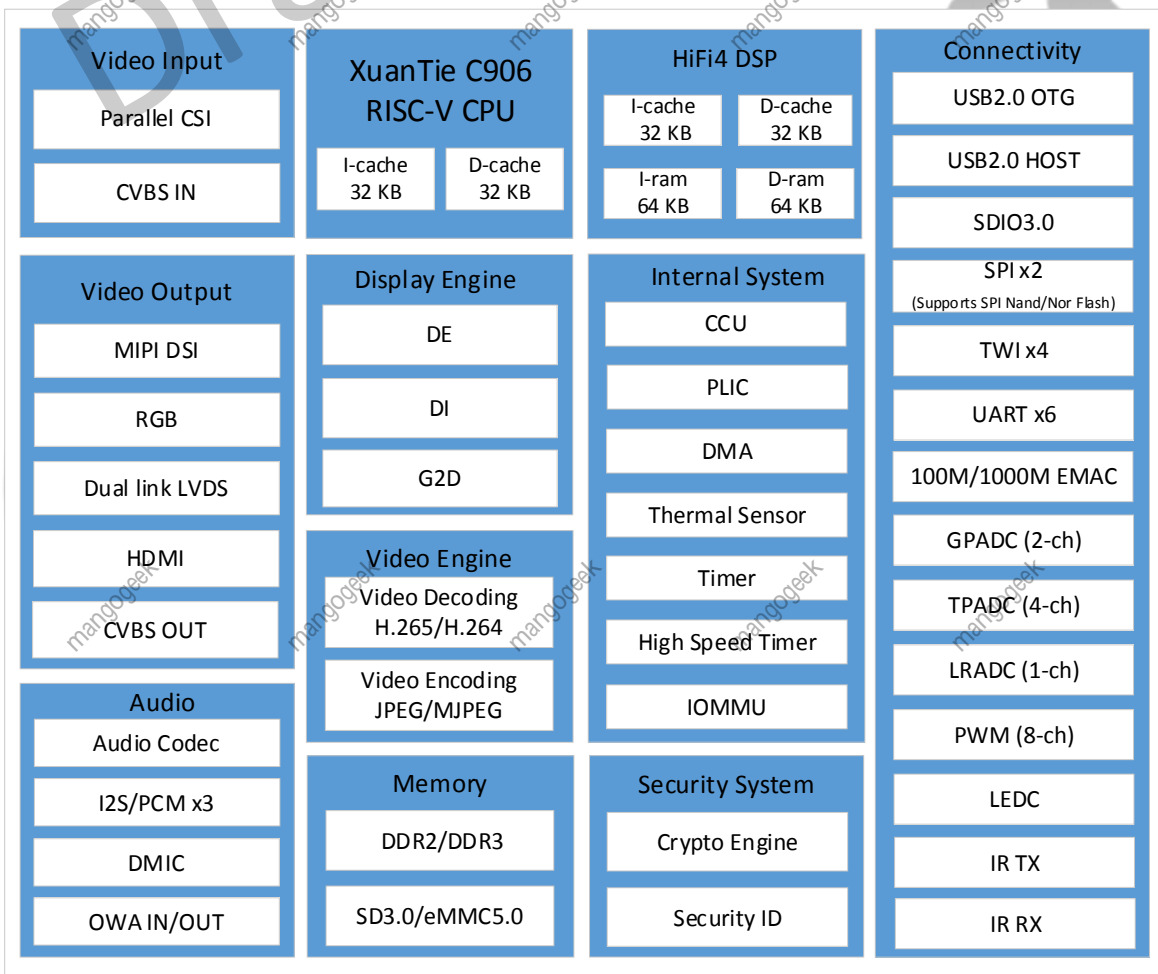

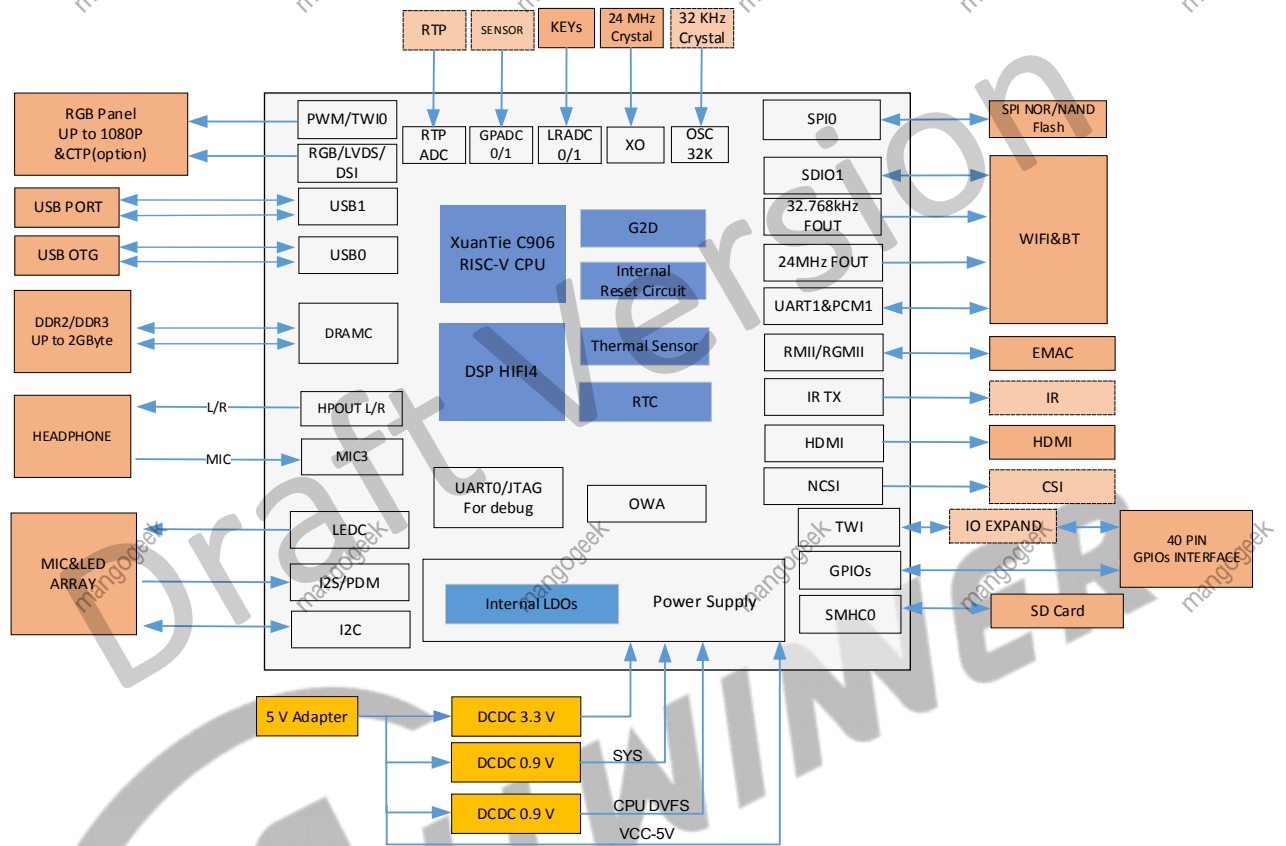

Figure 2-2 shows the solution of D1 multi-media decoding platform.

The following is the system memory mapping seen by the DSP0 host.

| Module | Cacheable Property | Address | Size | Address Mapping Description | |
|----------------|---------------------------------|---------------------------|---------------------------|--|--------------------|
| SRAM A1 | Non-Cacheable (Total 512 MB) | 0x0002 0000---0x0002 7FFF | 32 KB | The start address of the default DSP. | |
| DSP0 IRAM | | 0x0002 8000---0x0003 7FFF | 64 KB | The DSP0 accesses the address through the external bus to operate the internal local SRAM. | |
| DSP0 DRAM0 | | 0x0003 8000---0x0003 FFFF | 32 KB | | |
| DSP0 DRAM1 | | 0x0004 0000---0x0004 7FFF | 32 KB | | |
| DSP0 IRAM | | 0x0040 0000---0x0040 FFFF | 64 KB | The DSP0 accesses the address through the internal bus to directly access the local SRAM, which is more efficient than the external bus. | |
| DSP0 DRAM0 | | 0x0042 0000---0x0042 7FFF | 32 KB | | |
| DSP0 DRAM1 | | 0x0044 0000---0x0044 7FFF | 32 KB | | |
| L4_CONN_periph | | | 0x0200 0000---0x09FF FFFF | 128 MB | System Peripherals |
| DSP_SYS_CFG | | | 0x0170 0000---0x0170 0FFF | 4 KB | Peripherals |

| Module | Cacheable Property | Address | Size | Address Mapping Description |
|----------------------------------|-----------------------------|---------------------------|--------|--|
| DRAM SPACE | | 0x1000 0000---0x1FFF FFFF | 256 MB | The front 256 MB space of DDR (0x40000000–0x4FFFFFFF) It requires DSP output AHB for address remapping |
| Cacheable Mapping Area | | | | |
| SRAM | Cacheable (Total 512 MB) | 0x2002 0000---0x2002 7FFF | 32 KB | SRAM A1 has two addresses. |
| DSP0 IRAM | | 0x2002 8000---0x2003 7FFF | 64 KB | The DSP0 accesses the address through the external bus to operate the internal local SRAM. |
| DSP0 DRAM0 | | 0x2003 8000---0x2003 FFFF | 32 KB | |
| DSP0 DRAM1 | | 0x2004 0000---0x2004 7FFF | 32 KB | |
| DRAM SPACE | | 0x3000 0000---0x3FFF FFFF | 256 MB | The front 256 MB space of DDR (0x40000000–0x47FFFFFFF) It requires DSP output AHB for address remapping |
| DRAM Special Mapping Area | | | | |
| DRAM SPACE | Non-Cacheable | 0x4000 0000---0x7FFF FFFF | 1 GB | |
| DRAM SPACE | Cacheable Configurable | 0x8000 0000---0xBFFF FFFF | 1 GB | Reserved space |
| DRAM SPACE | Cacheable | 0xC000 0000---0xFFFF FFFF | 1 GB | The front 1 GB space of DDR (0x40000000–0x7FFFFFFF) |

3.2 Clock Controller Unit (CCU)

3.2.1 Overview

The clock controller unit (CCU) controls the PLL configurations and most of the clock generation, division, distribution, synchronization, and gating. The input signals of the CCU include the external clock for the reference frequency (24 MHz). The outputs from the CCU are mostly clocks to other blocks in the system.

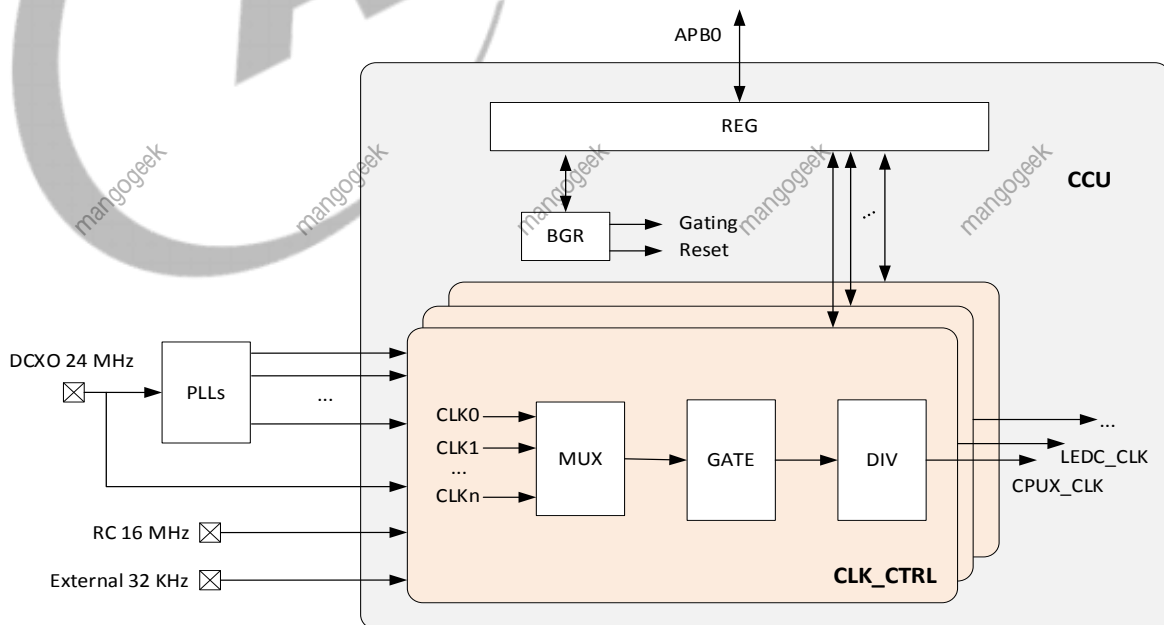

The CCU includes the following features:

- 8 PLLs
- Bus source and divisions
- Clock output control
- Configuring modules clock
- Bus clock gating
- Bus software reset

3.2.2 Block Diagram

The following figure shows the functional block diagram of the CCU.

Figure 3-1 CCU Block Diagram

3.2.3 Functional Description

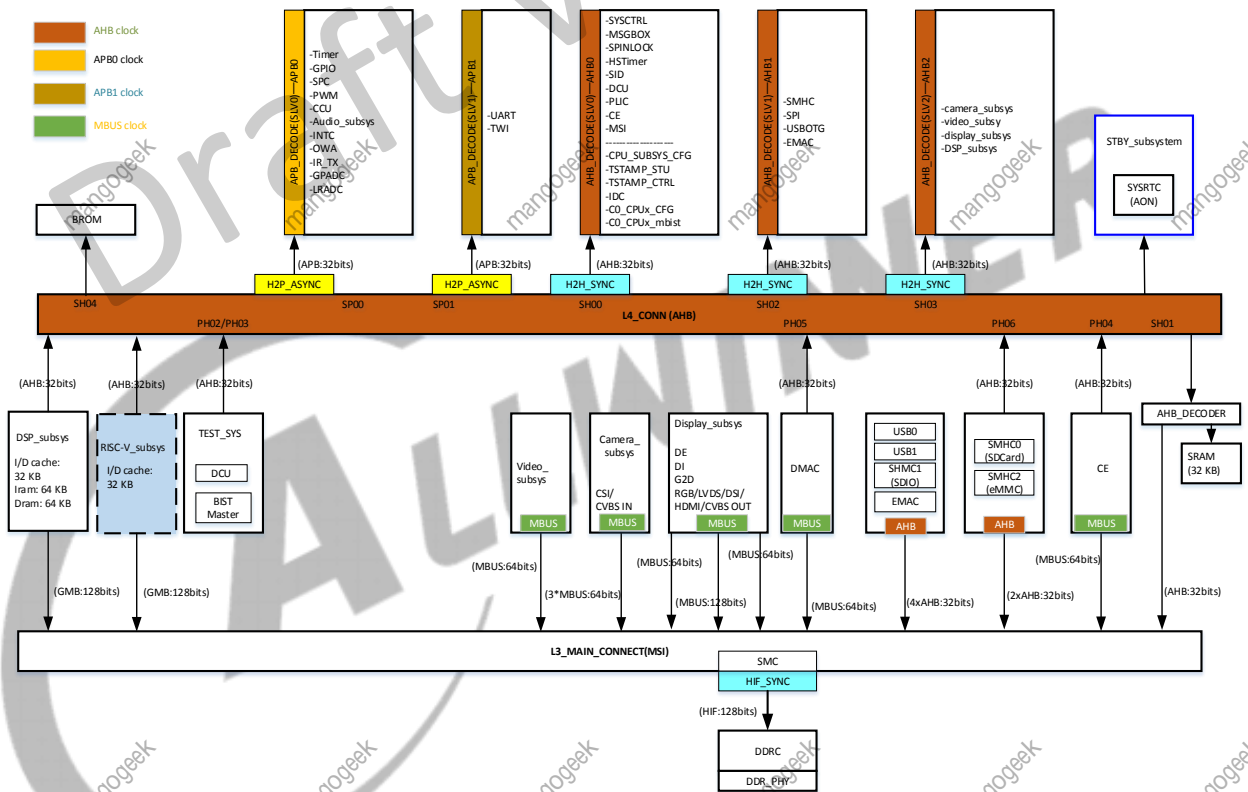

3.2.3.1 System Bus Tree

The system buses include advanced high-performance buses (AHBs), advanced peripheral buses (APBs), and MBUS.

All devices mounted at the bus should use the related bus clocks, and the gating signals for the bus are from the CCU module.

The following figure shows the diagram of the System Bus Tree.

Figure 3-2 System Bus Tree

3.2.3.3 PLL Distribution

The following figure shows the block diagram of the PLL distribution.

Figure 3-4 PLL Distribution

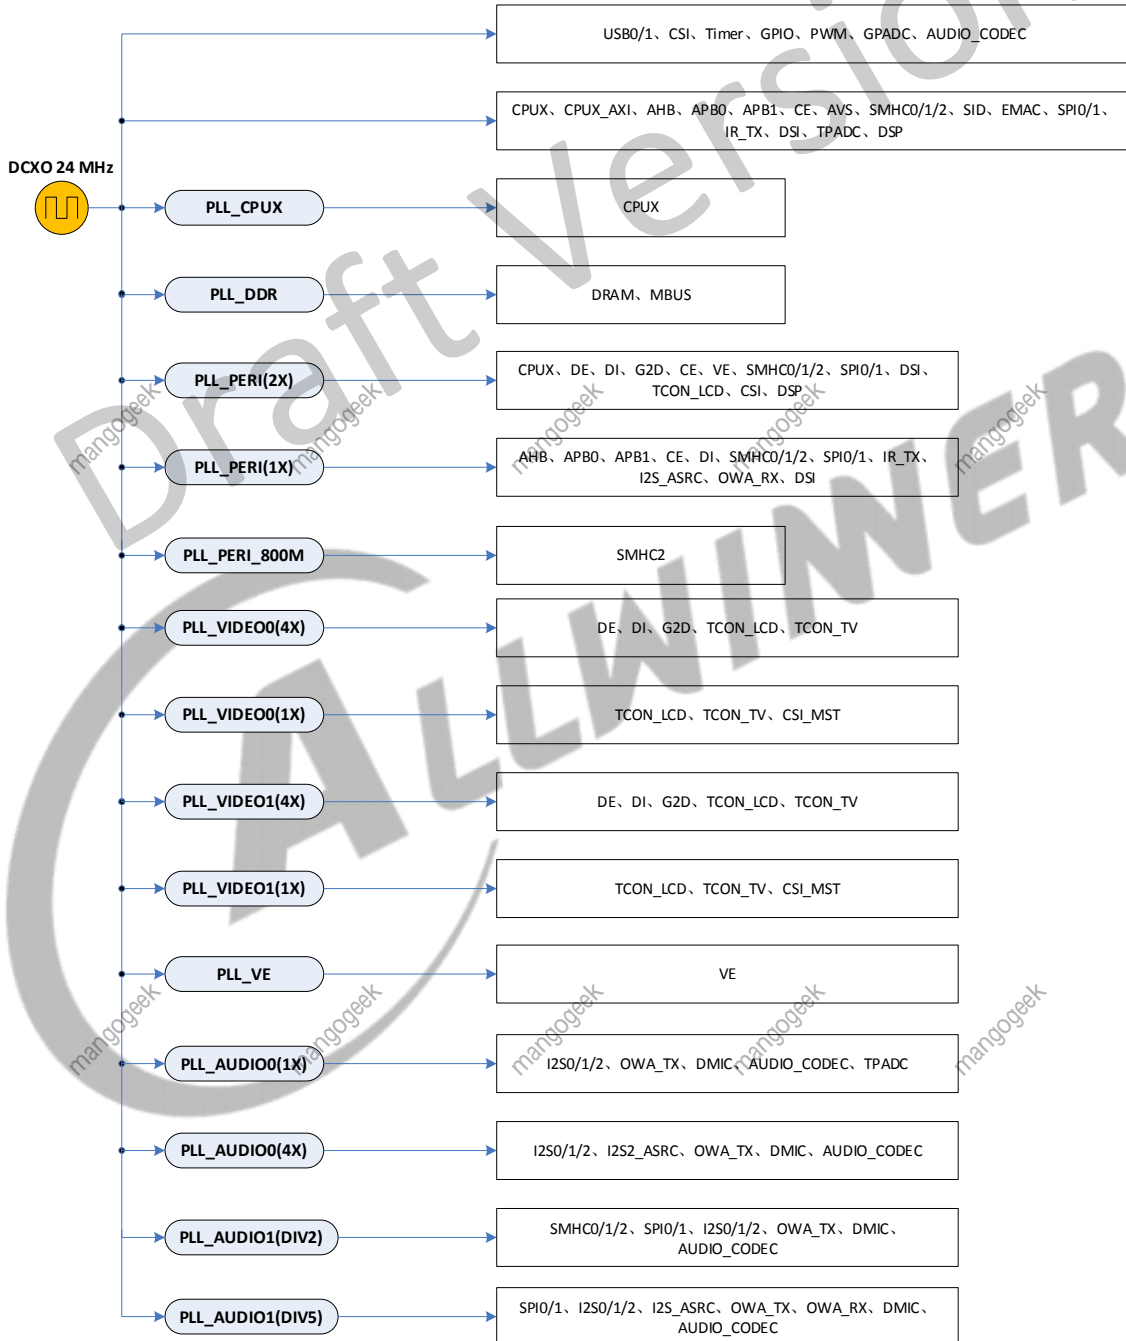

Table 3-1 PLL Typical Application

| PLL Type | Application Module | Notes |
|------------------|--|---|
| PLL_CPU | CPUX | Support DVFS |
| PLL_DDR | MBUS, SDRAM | Support spread spectrum No support linear FM |
| PLL_PERI(2X) | CPUX, DE, DI, G2D, CE, VE, SMHC0/1/2, SPI0/1, DSI, TCON_LCD, CSI, DSP | No support dynamic FM |
| PLL_PERI(1X) | AHB, APB0, APB1, CE, DI, SMHC0/1/2, SPI0/1, IR_TX, I2S_ASRC, OWA_RX, DSI | No support dynamic FM |
| PLL_PERI(800M) | SMHC2 | No support dynamic FM |
| PLL_VIDEO0(4X) | DE, DI, G2D, TCON_LCD, TCON_TV | No support DVFS |
| PLL_VIDEO0(1X) | TCON_LCD, TCON_TV, CSI_MST | No support DVFS |
| PLL_VIDEO1(4X) | DE, DI, G2D, TCON_LCD, TCON_TV | No support DVFS |
| PLL_VIDEO1(1X) | TCON_LCD, TCON_TV, CSI_MST | No support DVFS |
| PLL_VE | VE | No support dynamic FM |
| PLL_AUDIO0 | I2S0/1/2, OWA_TX, DMIC, AUDIO_CODEC, TPADC | No support DVFS |
| PLL_AUDIO0(4X) | I2S0/1/2, I2S2_ASRC, OWA_TX, DMIC, AUDIO_CODEC | No support DVFS |
| PLL_AUDIO1(DIV2) | SMHC0/1/2, SPI0/1, I2S0/1/2, OWA_TX, DMIC, AUDIO_CODEC | No support DVFS |
| PLL_AUDIO1(DIV5) | SPI0/1, I2S0/1/2, I2S_ASRC, OWA_TX, OWA_RX, DMIC, AUDIO_CODEC | No support DVFS |

3.2.3.4 PLL Features

The following table shows the PLL features.

Table 3-2 PLL Features

| PLL | Stable Operating Frequency | Actual Operating Frequency | Default Frequency | Spread Spectrum | Linear FM | Rate Control | Pk-Pk | Lock Time |
|----------------|--|--|---|-----------------|-----------|--------------|--|-----------|
| PLL_CPU | 288 MHz to 3.0 GHz (24*N) | 288 MHz to 1.8 GHz | 408 MHz | No | Yes | No | < 200 ps | 1.5 ms |
| PLL_AUDIO0 | 180 MHz to 3.0 GHz (24MHz*N.x/M1/M0/P) | 24.576 MHz 22.5792 MHz 24.576*4 MHz 22.5792*4 MHz | 24.576 MHz | Yes | No | No | < 200 ps | 500 us |
| PLL_AUDIO1 | 180 MHz to 3.0 GHz | Fvco/Div (Div:1-8) | Integer mode: 1/2x: 1.536 GHz 1/5x: 614.4 MHz Decimal mode: 1/2x: 1.1179648 GHz 1/5x: 471.8592 MHz | Yes | No | No | < 200 ps | 500 us |
| PLL_PERI | 180 MHz to 3.2 GHz (24*N/M1/M0) | Fvco/Div (Div:1-8) | 1/2x: 1.2 GHz 1/3x: 800 MHz | Yes | No | No | < 200ps | 500 us |
| PLL_VIDEO0(4X) | 252 MHz to 3.0 GHz (24*N/M) | 192 MHz to 2400 MHz | 1x: 297 MHz 2x: 594 MHz 4x: 1188 MHz | Yes | No | No | < 200ps | 500 us |
| PLL_VIDEO1(4X) | 252 MHz to 3.0 GHz (24*N/M) | 192 MHz to 2400 MHz | 1x: 297 MHz 2x: 594 MHz 4x: 1188 MHz | Yes | No | No | < 200ps | 500 us |
| PLL_VE | 180 MHz to 3.0 GHz (24*N/M1/M0) | 192 MHz to 600 MHz | 432 MHz | Yes | No | No | < 200ps | 500 us |
| PLL_DDR | 180 MHz to 3.0 GHz (24*N/M1/M0) | 192 MHz to 2.0 GHz | 432 MHz | Yes | No | No | 200 MHz to 800 MHz (< 200 ps) 800 MHz to 1.3GHz (< 140 ps) 1.3 GHz to 2.0 GHz (< 100 ps) | 2 ms |

3.2.3.5 The Usage Notes of PLL Frequencies

| PLL Type | PLL Calculate Formula | PLL Output Frequency Range | Post Frequency-Divider of Module | Typical Working-Frequency of Module | Recommended PLL Parameter Configuration |
|--------------|-----------------------|----------------------------|----------------------------------|---|---|
| PLL_CPU | 24*N | 200 MHz to 3 GHz | /P (1/2/4) | Based on the requirement of CPU | When the output clock is less than 288 MHz, the clock frequency can be outputted by dividing P. |
| PLL_PERI(1X) | 24MHz*N/M/P0/2 | 600 MHz (P0=2) | 1 to 64 | 600 MHz/300 MHz/ 200 MHz/150 MHz/ 100 MHz | N=100, M=1, P0=2, P1=3 |

| PLL Type | PLL Calculate Formula | PLL Output Frequency Range | Post Frequency-Divider of Module | Typical Working-Frequency of Module | Recommended PLL Parameter Configuration |
|---|--|--|----------------------------------|---|--|
| PLL_PERI(2X) | 24MHz*N/M/P0 | 1.2 GHz (P0=2) | 1 to 64 | 1.2 GHz/600 MHz/ 400 MHz/300 MHz/ 240 MHz/200 MHz/ 150 MHz/100 MHz | |
| PLL_PERI(800M) | 24MHz*N/M/P1 | 800 MHz (P1=3) | 1 to 64 | 800 MHz | |
| PLL_VIDEO0 | 24MHz*N/M | 4x:0<=1188 MHz 1x: 0<=297 MHz | 1 to 64 | 1188 MHz/585 MHz/ 537 MHz/ 501 MHz/ 468 MHz/462 MHz/ 426 MHz/390 MHz/ 357 MHz/297 MHz... | N=99, M=2 |
| PLL_VIDEO1 | 24MHz*N/M | 4x:0<=1188 MHz 1x: 0<=297 MHz | 1 to 64 | 1188 MHz/585 MHz/ 537 MHz/ 501 MHz/ 468 MHz/462 MHz/ 426 MHz/390 MHz/ 357 MHz/297 MHz... | N=99, M=2, |
| PLL_VE | 24MHz*N/M1/M0 | 200 MHz to 600 MHz | 1 to 64 | 600 MHz/450 MHz/ 360 MHz/270 MHz | N=25, M1=1, M0=2 |
| PLL_DDR | 24MHz*N/M1/M0 | 192 MHz to 2.0 GHz | 1 to 64 | 200 MHz/400 MHz/ 800 MHz | N=100, M1=M0=1, P=3 |
| PLL_AUDIO0(1X) PLL_AUDIO0(4X) Decimal | 24MHz*N.x/M1/M0/P/4 24MHz*N.x/M1/M0/P | 24.576/22.5792 MHz (24.576/22.5792)*4 MHz | 1 to 64 | 24.576/22.5792 MHz (24.576/22.5792)*4 MHz | 24.571:N.x=14.336, P=14, M0=1, M1=1 22.5792:N.x=7.5264, P=8, M0=1, M1=1 |
| PLL_AUDIO1(DIV2) Integral | 24MHz*N/M/P0 | 1536 MHz (P0=2) | 4 | 384 MHz | N=128, M=1, P0=2, P1=5 |
| | | | 5 | 307 MHz | |
| | | | 6 | 256 MHz | |
| | | | 8 | 192 MHz | |
| | | | 10 | 154 MHz | |
| | | | 16 | 96 MHz | |
| | | | | | |
| PLL_AUDIO1(DIV5) Integral | 24MHz*N/M/P1 | 614.4 MHz (P1=5) | 25 | 24.576 MHz The jitter of this frequency point is better. The frequency point is used for audio module. | |
| PLL_AUDIO0(DIV2) Decimal | 24MHz*N.x/M/P0 | 1179.648 MHz (P0=2) | 2 | 600 MHz | N.x=98.304, M=1, P0=2, P1=1 to 8 |

3.2.4 Programming Guidelines

3.2.4.1 Configuring the Frequency of PLL_CPU

The frequency configuration formula of PLL_CPU:

$$\text{PLL_CPU} = 24 \text{ MHz} * \text{N} / \text{P}$$

The parameter N is the frequency-doubling factor of PLL. The next parameter configuration can proceed after the PLL relock. The parameter P ([CPU AXI CFG REG\[17:16\]](#)) is a digital post-frequency-division factor, which can be dynamically switched in real-time, without affecting the normal work of PLL.

 **NOTE**

PLL_CPU supports dynamic frequency adjustment (modifying the value of N). However, for the system stability, to configure the frequency of the PLL_CPU from a higher value to a lower one, switch the clock source of the CPU to another clock whose frequency is not higher than the current one first, and configure PLL_CPU to the target low frequency, and then switch the clock source of the CPU back to PLL_CPU.

Follow the steps below to adjust the frequency of PLL_CPU:

- Step 1** Before you configure PLL_CPU, switch the clock source of CPU to PLL_PERI(1X).
- Step 2** Modify the parameters N and P of PLL_CPU.
- Step 3** Write the PLL Lock Enable bit (bit[29]) of [PLL CPU CTRL REG](#) to 0 and then to 1.
- Step 4** Wait for the Lock bit (bit[28]) of [PLL CPU CTRL REG](#) to change to 1.
- Step 5** Switch the clock source of the CPU to PLL_CPU.

3.2.4.2 Configuring the Frequency of PLL_AUDIO

 **NOTE**

PLL_AUDIO includes PLL_AUDIO0 and PLL_AUDIO1.

The frequency configuration formula of PLL_AUDIO:

$$\text{PLL_AUDIO0} = 24 \text{ MHz} * \text{N} / \text{M0} / \text{M1} / \text{P} / 4$$

$$\text{PLL_AUDIO1} = 24 \text{ MHz} * \text{N} / \text{M}$$

PLL_AUDIO does not support dynamic adjustment because changing any parameter of N, M0, M1, and P will affect the normal work of PLL, and the PLL will need to be relocked.

Generally, PLL_AUDIO only needs two frequency points: 24.576*4 MHz or 22.5792*4 MHz. For these two frequencies, there are usually special recommended matching factors. To implement the desired frequency point of PLL_AUDIO, you need to use the decimal frequency-division function, so follow the steps below:

- Step 1** Configure the N, M0, M1 and P factors.
- Step 2** Configure [PLL_AUDIOx Control Register](#)[PLL_SDM_ENABLE] to 1.
- Step 3** Configure [PLL_AUDIOx Pattern0 Control Register](#) to enable the digital spread spectrum.
- Step 4** Write [PLL_AUDIOx Control Register](#)[Lock Enable] to 0 and then to 1.
- Step 5** Wait for [PLL_AUDIOx Control Register](#)[Lock] to 1.

NOTE

When the P factor of PLL_AUDIO is an odd number, the clock output is an unequal-duty-cycle signal.

The recommended values for configuration factors of PLL_AUDIO1 are as follows.

Table 3-3 Recommended Values for Configuration Factors of PLL_AUDIO1

| Mode | Clock Source (MHz) | Frequency-doubling N | VCO (MHz) | Post Frequency-Division | PLL Output (MHz) | Divisor | Actual Operating Frequency (MHz) | Description |
|-----------------|--------------------|----------------------|-----------|-------------------------|------------------|---------|----------------------------------|--|
| Integer divider | 24 | 128 | 3072 | 2 | 1536 | 4 | 384 | Provide clock source for peripherals |
| | | | | | | 8 | 192 | |
| | | | | 16 | | 96 | | |
| | | | | | | | | |
| | | | | 5 | 614.4 | 25 | 24.576 | For audio-related modules |
| Decimal divider | 24 | 98.304 | 2359.296 | 2 | 1179.648 | 2 | 589.824 | Provides clock source for peripheral devices |
| | | | | | | 3 | 393.216 | |
| | | | | | | 6 | 196.608 | |
| | | | | | | 12 | 98.304 | |

| Mode | Clock Source (MHz) | Frequency-doubling N | VCO (MHz) | Post Frequency-Division | PLL Output (MHz) | Divisor | Actual Operating Frequency (MHz) | Description |
|------|--------------------|----------------------|-----------|-------------------------|------------------|---------|----------------------------------|---------------------------|
| | | | | | | 48 | 24.576 | For audio-related modules |
| | | | | 5 | 471.8592 | | | |

3.2.4.3 Configuring the Frequency of General PLLs

- Step 1** Make sure the PLL is enabled. If not, refer to section 3.2.4.4 [Enabling the PLL](#) to enable the PLL.
- Step 2** Configure the PLL_OUTPUT_ENABLE bit (bit[27]) of the PLL control register as 0 to disable the output gate of the PLL because general PLLs are unavailable in the process of frequency modulation.
- Step 3** Configure the N and M factors. (It is not suggested to configure M1 factor)
- Step 4** Write the LOCK_ENABLE bit (bit[29]) of the PLL control register to 0 and then to 1.
- Step 5** Wait for the LOCK bit (bit[28]) of the PLL control register to 1.
- Step 6** Configure PLL_OUTPUT_ENABLE bit (bit[27]) of the PLL control register to 1.

3.2.4.4 Enabling the PLL

Follow the steps below to enable the PLL:

- Step 1** Configure the N, M, and P factors of the PLL control register.
- Step 2** Write the PLL_ENABLE bit and the LDO_EN bit of the PLL control register to 1, write the PLL_OUTPUT_GATE bit of the PLL control register to 0.
- Step 3** Write the LOCK_ENABLE bit of the PLL control register to 1.
- Step 4** Wait for the status of the Lock to change to 1.
- Step 5** Delay 20 us.
- Step 6** Write the PLL_OUTPUT_GATE bit of the PLL control register to 1 and then the PLL will be available.

3.2.4.5 Disabling the PLL

Follow the steps below to disable the PLL:

Step 1 Write the PLL_ENABLE bit (bit[31]) and the LDO_EN bit of the PLL control register to 0.

Step 2 Write the LOCK_ENABLE bit (bit[29]) of the PLL control register to 0.

In the normal use of PLLs, it is unsuggested to enable and disable the PLLs frequently. Turning on and off the PLLs will cause mutual interference between PLLs, which will affect the stability of the system. When the clock is unnecessary, you can write 0 to the PLL_OUTPUT_EN bit of the PLL control register to disable the output gate of the PLL, instead of writing 0 to the Enable bit to disable the PLL.

3.2.4.6 Configuring Bus Clock

The bus clock supports dynamic switching, but the process of switching needs to follow the following two rules:

- From a higher frequency to a lower frequency: switch the clock source first, and then set the frequency division factor;
- From a lower frequency to a higher frequency: configure the frequency division factor first, and then switch the clock source.

3.2.4.7 Configuring Module Clocks

For the Bus Gating Reset register of a module, the reset bit is de-asserted first, and then the clock gating bit is enabled to avoid potential problems caused by the asynchronous release of the reset signal.

For all module clocks except the DDR clock, configure the clock source and frequency division factor first, and then release the clock gating (that is, set to 1). For the configuration order of the clock source and frequency division factor, follow the rules below:

- With the increasing of the clock source frequency, configure the frequency division factor before the clock source;
- With the decreasing of the clock source frequency, configure the clock source before the frequency division factor.

3.2.4.8 Implementing Spread Spectrum

The spread spectrum technology is to convert a narrowband signal into a wideband signal. It helps to reduce the effect of electromagnetic interference (EMI) associated with the fundamental frequency of the signal.

For the general PLL frequency, the calculation formula is as follows:

$$f = \frac{N+1+X}{P \cdot (M0+1) \cdot (M1+1)} \cdot 24MHz, 0 < X < 1$$

Where,

P is the frequency division factor of module or PLL;

M0 is the post-frequency division factor of PLL;

M1 is the pre-frequency division factor of PLL;

N is the frequency doubling factor of PLL;

X is the amplitude coefficient of the spread spectrum.

The parameters N, P, M1, and M0 are for the frequency division.

When M1 = 0, M0 = 0, and P = 1 (no frequency division), the calculation formula of PLL frequency can be simplified as follows:

$$f = (N+1+X) \cdot 24MHz, 0 < X < 1$$

$$[f_1, f_2] = (N+1+[X_1, X_2]) \cdot 24MHz$$

$$SDM_BOT = 2^{17} \cdot X_1$$

$$WAVE_STEP = 2^{17} \cdot (X_2 - X_1) / (24MHz / PREQ) \cdot 2$$

Where, SDM_BOT and WAVE_STEP are bits of the PLL pattern control register, and PREQ is the frequency of the spread spectrum.

NOTE

Different PLLs have different calculate formulas, refer to the CTRL register of the corresponding PLL in section 3.2.6 [Register Description](#).

Configuration Procedure

Follow the steps below to implement the spread spectrum:

Step 1 Configure the control register of the corresponding PLL

- a) Calculate the factor N and decimal value X according to the PLL frequency and PLL frequency formula. Refer to the control register of the corresponding PLL (named PLL_xxx_CTRL_REG, where xxx is the module name) in 3.2.6 [Register Description](#) for the corresponding PLL frequency formula.
- b) Write M0, M1, N, and PLL frequency to the PLL control register.

- c) Configure the SDM_Enable bit (bit[24]) of the PLL control register to 1 to enable the spread spectrum function.

Step 2 Configure the pattern control register of the corresponding PLL

- a) Calculate the SDM_BOT and WAVE_STEP of the pattern control register according to decimal value X and spread spectrum frequency (the bit[18:17] of the PLL_PAT register)
- b) Configure the spread spectrum mode (SPR_FREQ_MODE) to 2 or 3.
- c) If the bit PLL_INPUT_DIV2 of the PLL control register is 1, configure the spread spectrum clock source select bit (SDM_CLK_SEL) of the PLL pattern control register to 1. Otherwise, configure SDM_CLK_SEL to the default value 0.
- d) Write SDM_BOT, WAVE_STEP, PREQ, SPR_FREQ_MODE, and SDM_CLK_SEL to the PLL pattern control register, and configure the SIG_DELT_PAT_EN bit (bit[31]) of this register to 1.

Step 3 Delay 20 us.

Configuration Example

The following example shows how to configure the spread spectrum frequency as 605.3 MHz to 609.7 MHz.

If M1 = 0, M0 = 0, P = 1, according to the formula $[f_1, f_2] = (N + 1 + [X_1, X_2]) \cdot 24MHz$, you can get:

$$\begin{aligned}
 N + 1 + [X_1, X_2] &= \frac{[605.3, 609.7]}{24} \\
 &= \frac{600 + [5.3, 9.7]}{24} \\
 &= 24 + 1 + [5.3/24, 9.7/24]
 \end{aligned}$$

Obviously,

$$N = 24, X_1 = 5.3/24, X_2 = 9.7/24$$

$$SDM_BOT = 2^{17} * X_1 = 0x7111$$

$$WAVE_STEP = 2^{17} * (X_2 - X_1) / (24M/PREQ) * 2 = 0x3f; PREQ = 31.5 kHz$$

If M0 = 1, M1=0, P = 1, then total frequency division factor is (M0 + 1) * 1 = 2, so the actual output frequency of PLL is 1212.1 MHz to 1219.4 MHz.

Similarly, you can get:

$$N = 49, X_1 = 12.1/24, X_2 = 19.4/24$$

Then calculate the values of SDM_BOT and WAVE_STEP according to the formulas, and follow the steps described in [Configuration Procedure](#).

Configuration Procedure

3.2.5 Register List

| Module Name | Base Address |
|-------------|--------------|
| CCU | 0x02001000 |

| Register Name | Offset | Description |
|--------------------------|--------|--------------------------------------|
| PLL_CPU_CTRL_REG | 0x0000 | PLL_CPU Control Register |
| PLL_DDR_CTRL_REG | 0x0010 | PLL_DDR Control Register |
| PLL_PERI_CTRL_REG | 0x0020 | PLL_PERI Control Register |
| PLL_VIDEO0_CTRL_REG | 0x0040 | PLL_VIDEO0 Control Register |
| PLL_VIDEO1_CTRL_REG | 0x0048 | PLL_VIDEO1 Control Register |
| PLL_VE_CTRL_REG | 0x0058 | PLL_VE Control Register |
| PLL_AUDIO0_CTRL_REG | 0x0078 | PLL_AUDIO0 Control Register |
| PLL_AUDIO1_CTRL_REG | 0x0080 | PLL_AUDIO1 Control Register |
| PLL_DDR_PAT0_CTRL_REG | 0x0110 | PLL_DDR Pattern0 Control Register |
| PLL_DDR_PAT1_CTRL_REG | 0x0114 | PLL_DDR Pattern1 Control Register |
| PLL_PERI_PAT0_CTRL_REG | 0x0120 | PLL_PERI Pattern0 Control Register |
| PLL_PERI_PAT1_CTRL_REG | 0x0124 | PLL_PERI Pattern1 Control Register |
| PLL_VIDEO0_PAT0_CTRL_REG | 0x0140 | PLL_VIDEO0 Pattern0 Control Register |
| PLL_VIDEO0_PAT1_CTRL_REG | 0x0144 | PLL_VIDEO0 Pattern1 Control Register |
| PLL_VIDEO1_PAT0_CTRL_REG | 0x0148 | PLL_VIDEO1 Pattern0 Control Register |
| PLL_VIDEO1_PAT1_CTRL_REG | 0x014C | PLL_VIDEO1 Pattern1 Control Register |
| PLL_VE_PAT0_CTRL_REG | 0x0158 | PLL_VE Pattern0 Control Register |
| PLL_VE_PAT1_CTRL_REG | 0x015C | PLL_VE Pattern1 Control Register |
| PLL_AUDIO0_PAT0_CTRL_REG | 0x0178 | PLL_AUDIO0 Pattern0 Control Register |
| PLL_AUDIO0_PAT1_CTRL_REG | 0x017C | PLL_AUDIO0 Pattern1 Control Register |
| PLL_AUDIO1_PAT0_CTRL_REG | 0x0180 | PLL_AUDIO1 Pattern0 Control Register |
| PLL_AUDIO1_PAT1_CTRL_REG | 0x0184 | PLL_AUDIO1 Pattern1 Control Register |
| PLL_CPU_BIAS_REG | 0x0300 | PLL_CPU Bias Register |
| PLL_DDR_BIAS_REG | 0x0310 | PLL_DDR Bias Register |

| Register Name | Offset | Description |
|-------------------------|--------|------------------------------------|
| PLL_PERI_BIAS_REG | 0x0320 | PLL_PERI Bias Register |
| PLL_VIDEO0_BIAS_REG | 0x0340 | PLL_VIDEO0 Bias Register |
| PLL_VIDEO1_BIAS_REG | 0x0348 | PLL_VIDEO1 Bias Register |
| PLL_VE_BIAS_REG | 0x0358 | PLL_VE Bias Register |
| PLL_AUDIO0_BIAS_REG | 0x0378 | PLL_AUDIO0 Bias Register |
| PLL_AUDIO1_BIAS_REG | 0x0380 | PLL_AUDIO1 Bias Register |
| PLL_CPU_TUN_REG | 0x0400 | PLL_CPU Tuning Register |

3.2.6 Register Description

3.2.6.1 0x0000 PLL_CPU Control Register (Default Value: 0x4A00_1000)

| Offset: 0x0000 | | | Register Name: PLL_CPU_CTRL_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R/W | 0x0 | <p>PLL_EN PLL Enable 0: Disable 1: Enable</p> <p>PLL_CPU= InputFreq*N. The PLL_CPU output frequency must be in the range from 200 MHz to 3 GHz. And the default value of PLL_CPU is 408 MHz when the crystal oscillator is 24 MHz.</p> |
| 30 | R/W | 0x1 | <p>PLL_LDO_EN LDO Enable 0: Disable 1: Enable</p> |
| 29 | R/W | 0x0 | <p>LOCK_ENABLE Lock Enable 0: Disable 1: Enable</p> |
| 28 | R | 0x0 | <p>LOCK PLL Lock Status 0: Unlocked 1: Locked (It indicates that the PLL has been stable.)</p> |
| 27 | R/W | 0x1 | <p>PLL_OUTPUT_GATE PLL Output Gating Enable 0: Disable 1: Enable</p> <p>The bit is used to control the output enable of the PLL.</p> |
| 26:24 | R/W | 0x2 | <p>PLL_LOCK_TIME. PLL Lock Time The bit indicates the step amplitude from one frequency to another.</p> |
| 23:16 | / | / | / |

| Offset: 0x0000 | | | Register Name: PLL_CPU_CTRL_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 15:8 | R/W | 0x10 | PLL_N PLL N $N = PLL_N + 1$ PLL_N is from 0 to 254. In application, PLL_N shall be more than or equal to 12. |
| 7:6 | R/W | 0x0 | PLL_UNLOCK_MDSEL PLL Unlock Level 00: 21-29 Clock Cycles 01: 22-28 Clock Cycles 1X: 20-30 Clock Cycles |
| 5 | R/W | 0x0 | PLL_LOCK_MDSEL PLL Lock Level 0: 24-26 Clock Cycles 1: 23-27 Clock Cycles |
| 4:2 | / | / | / |
| 1:0 | R/W | 0x0 | PLL_M PLL_M $M = PLL_FACTOR_M + 1$ PLL_FACTOR_M is from 0 to 3. Note: The M factor is only for testing. |

3.2.6.2 0x0010 PLL_DDR Control Register (Default Value: 0x4800_2301)

| Offset: 0x0010 | | | Register Name: PLL_DDR_CTRL_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R/W | 0x0 | PLL_EN 0: Disable 1: Enable $PLL_DDR = InputFreq * N / M1 / M0$. The default value of PLL_DDR is 432 MHz when the crystal oscillator is 24 MHz. |
| 30 | R/W | 0x1 | PLL_LDO_EN LDO ENABLE 0: Disable 1: Enable |

| Offset: 0x0010 | | | Register Name: PLL_DDR_CTRL_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 29 | R/W | 0x0 | <p>LOCK_ENABLE</p> <p>Lock Enable</p> <p>0: Disable</p> <p>1: Enable</p> |
| 28 | R | 0x0 | <p>LOCK</p> <p>PLL Lock</p> <p>0: Unlocked</p> <p>1: Locked (It indicates that the PLL has been stable.)</p> |

3.3 BROM System

3.3.1 Overview

The system has several ways to boot. It has an integrated on-chip Boot ROM (BROM) that is considered the primary program-loader. On the startup process, the D1 starts to fetch the first instruction from address 0x0, where is the BROM located at.

The BROM system is divided into two parts: the firmware exchange launch (FEL) module and the Medium Boot module. FEL is responsible for writing the external data to the local NVM, and Medium Boot is responsible for loading an effective and legitimate BOOT0 from NVM and running.

The BROM system includes the following features:

- Supports CPU0 boot process
- Supports mandatory upgrade process through USB and SD card
- Supports GPIO pin and eFuse to select the boot media type

3.3.2 Functional Description

BROM configurations mainly include selecting the brom type, boot medium, boot mode, and fast boot process.

3.3.2.1 Selecting the Brom Type

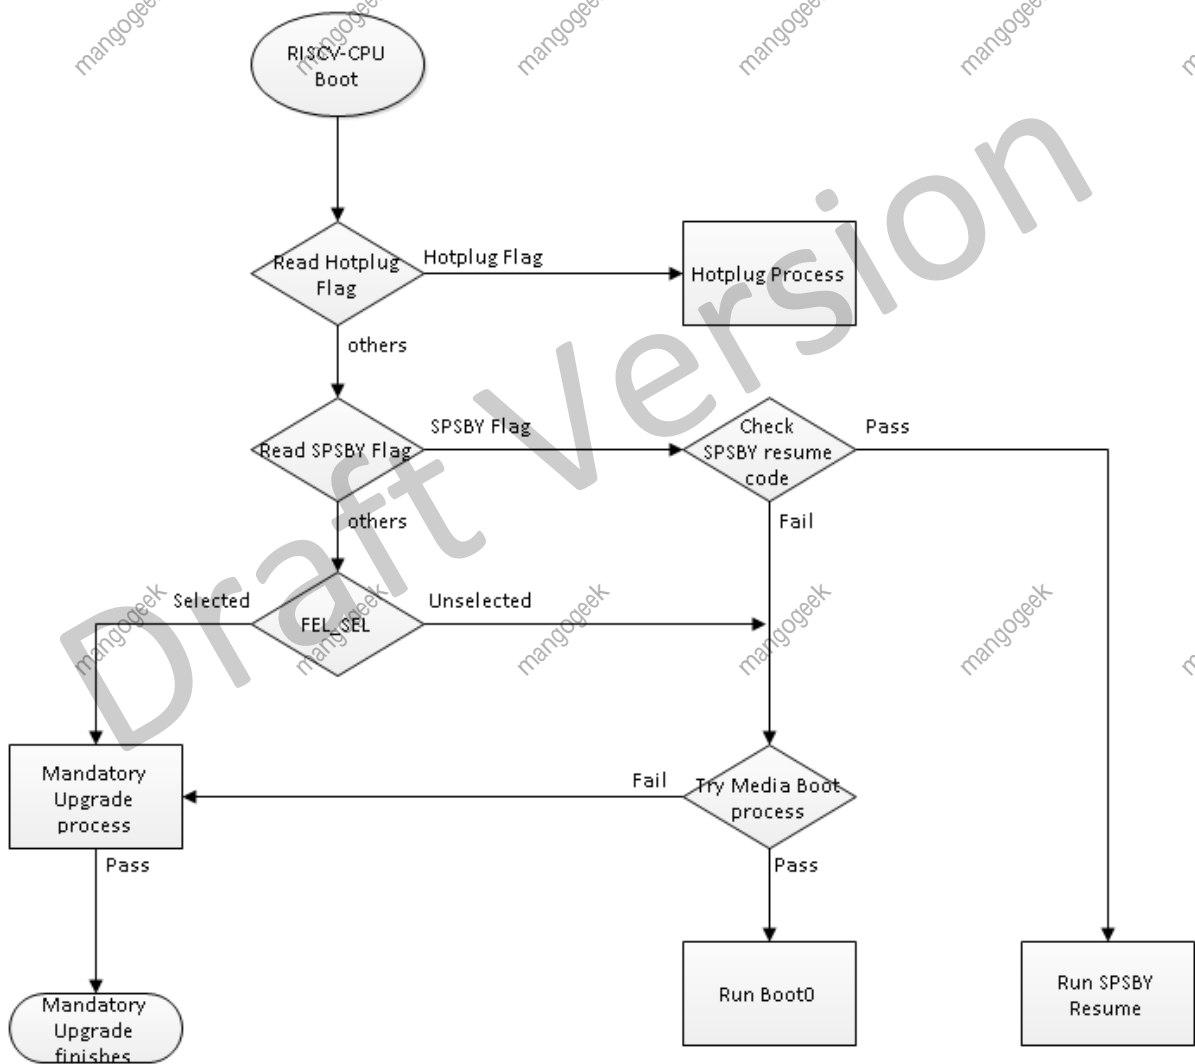

On startup, the SOC will read the state of BROM_SELET, according to the state of BROM_MODE to decide whether the way to select the kind of BROM to boot.

Table 3-4 BOOT_Process Setting

| BOOT_SELECT[1:0] | BROM Process Type |
|------------------|-------------------|
| 00 | Master-slave |
| 01 | R_BROM |
| 10 | Reserved |
| 11 | Reserved |

If the state of the BOOT_SELECT is 01, the R_BROM type is choosed.

Figure 3-5 R_BROM Process

3.3.2.2 Selecting the Boot Medium

The BROM system supports the following boot media:

- SD card
- eMMC
- SPI NOR FLASH
- SPI NAND FLASH

There are two ways to select the boot medium: GPIO Pin Select and eFuse Select. On startup, the BROM will read the state of BOOT_MODE and decide which way to select the type of boot medium. The BROM_SELET is the bits in the eFuse mapping.

The following table shows BOOT_MODE Setting.

Table 3-5 BOOT_MODE Setting

| BOOT_MODE | Boot_Select Type |
|-----------|--|
| 0 | GPIO boot select, indicates that the boot medium is decided by the value of the GPIO pin. |
| 1 | eFuse boot select, indicates that the boot medium is decided by the value of the eFuse type. |

GPIO Boot Select

If the state of the BOOT_MODE is 0, the boot medium is decided by the value of the GPIO pin. The following table shows the boot medium priority. The boot medium priority describes the possibility that each medium to be selected as the boot medium. The BROM reads the boot0 of the medium with the highest priority first. If the medium does not exist or has any problems, the BROM will try the next medium. Otherwise, the medium will be selected as the boot medium.

Table 3-6 GPIO Boot Select Configuration

| Pin_Boot_Select[1:0] | Boot Medium Priority |
|----------------------|---|
| 00 | SMHC0->EMMC2_USR->EMMC2_BOOT->other media |
| 01 | SMHC0->SPI NOR->other media |
| 10 | SMHC0->SPI NAND->other media |
| 11 | SMHC0->EMMC2_BOOT->EMMC2_USR->other media |

eFuse Boot Select

If the state of the BOOT_MODE is 1, the boot medium is decided by the value of eFuse_Boot_Select_Cfg. The eFuse_Boot_Select_Cfg is divided into 4 groups and each group is 3-bit. The following table shows the groups of eFUSE_Boot_Select.

Table 3-7 Groups of eFuse_Boot_Select

| eFuse_Boot_Select_Cfg[11:0] | Group |
|-----------------------------|---------------------|
| eFuse_Boot_Select_Cfg[2:0] | eFuse_Boot_Select_1 |
| eFuse_Boot_Select_Cfg[5:3] | eFuse_Boot_Select_2 |
| eFuse_Boot_Select_Cfg[8:6] | eFuse_Boot_Select_3 |
| eFuse_Boot_Select_Cfg[11:9] | eFuse_Boot_Select_4 |

The four groups take effect with the following priority:

eFuse_Boot_Select_1 -> eFuse_Boot_Select_2 -> eFuse_Boot_Select_3 -> eFuse_Boot_Select_4

For example, eFuse_Boot_Select_2 will not take effect unless eFuse_Boot_Select_1 is set as 0x111, eFuse_Boot_Select_3 will not take effect unless eFuse_Boot_Select_2 is set as 0x111, and so on.

The following table shows the boot medium priority for the different values of eFuse_Boot_Select_n, where n = [4:1]. The eFuse_Boot_Select_1 to eFuse_Boot_Select_3 are the same setting. But for eFuse_Boot_Select_4, if its value is 0x111, the BROM will select the boot medium in the Try mode. The BROM in the Try mode follows the order below to select the boot medium:

SMHC0 -> SPI NOR -> SPI NAND -> SMHC2

Table 3-8 eFuse Boot Select Setting

| eFuse_Boot_Select_n | Boot Medium Priority |
|---------------------|---|
| 000 | Select the boot medium in Try mode. |
| 001 | Reserved |
| 010 | SHMC2 |
| 011 | SPI NOR |
| 100 | SPI NAND |
| 101 | Reserved |
| 110 | Reserved |
| 111 | When n is 1 to 3: The boot medium is decided by the value of eFuse_Boot_Select_(n + 1). When n is 4: Select the boot medium in Try mode. |

3.3.2.3 Selecting the Boot Mode

The system only supports normal BROM mode.

In Normal BROM Mode, the system boot starts from CPU0, and then the BROM will read the state of the FEL pin. If the FEL pin is high, the system will jump to the fast boot process. If it is low, the system will jump to the mandatory upgrade process.

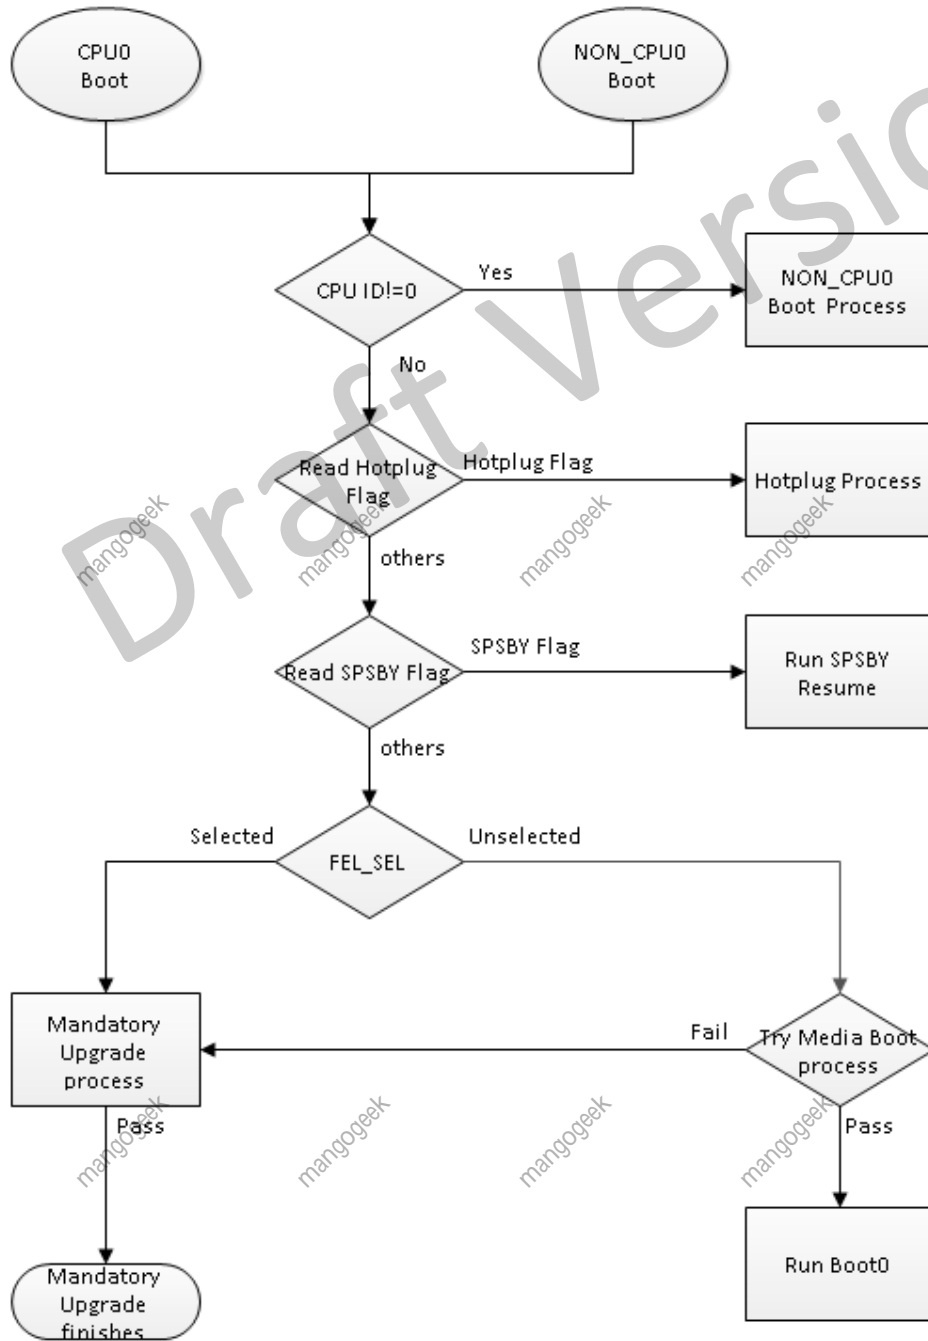

NOTE

D1 only supports CPU0 boot branch.

The following figure shows the boot process in Normal BROM Mode.

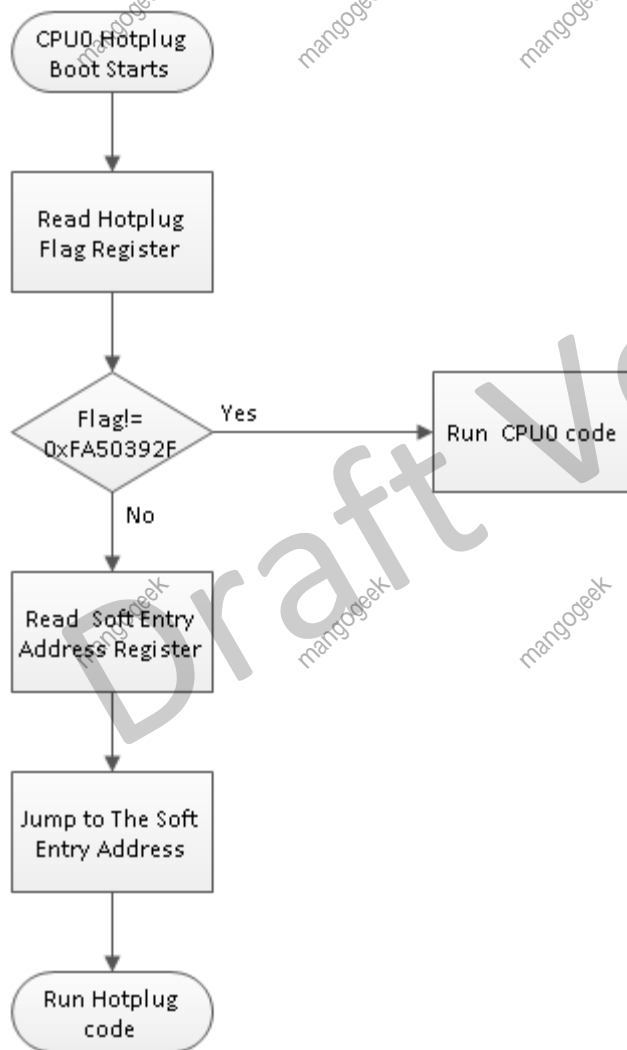

Figure 3-6 Boot Process in Normal BROM Mode

CPU0 Hotplug Process

The Hotplug Flag determines whether the system will do Hotplug boot, if the CPU Hotplug Flag value is equal to 0xFA50392F, then read the Soft Entry Register and the system will jump to the Soft Entry Address. The following figure shows the CPU0 Hotplug Process.

Figure 3-7 CPU0 Hotplug Process Diagram

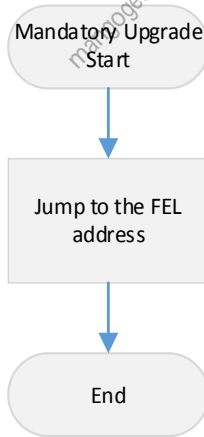

NOTE

- The Hotplug Flag Register is 0x070005DC.
- The Soft Entry Address Register is 0x070005E0.

Mandatory Upgrade Process

If the FEL pin is detected to pull low, the system will jump to the mandatory upgrade process. The following figure shows the mandatory upgrade process.

Figure 3-8 Mandatory Upgrade Process

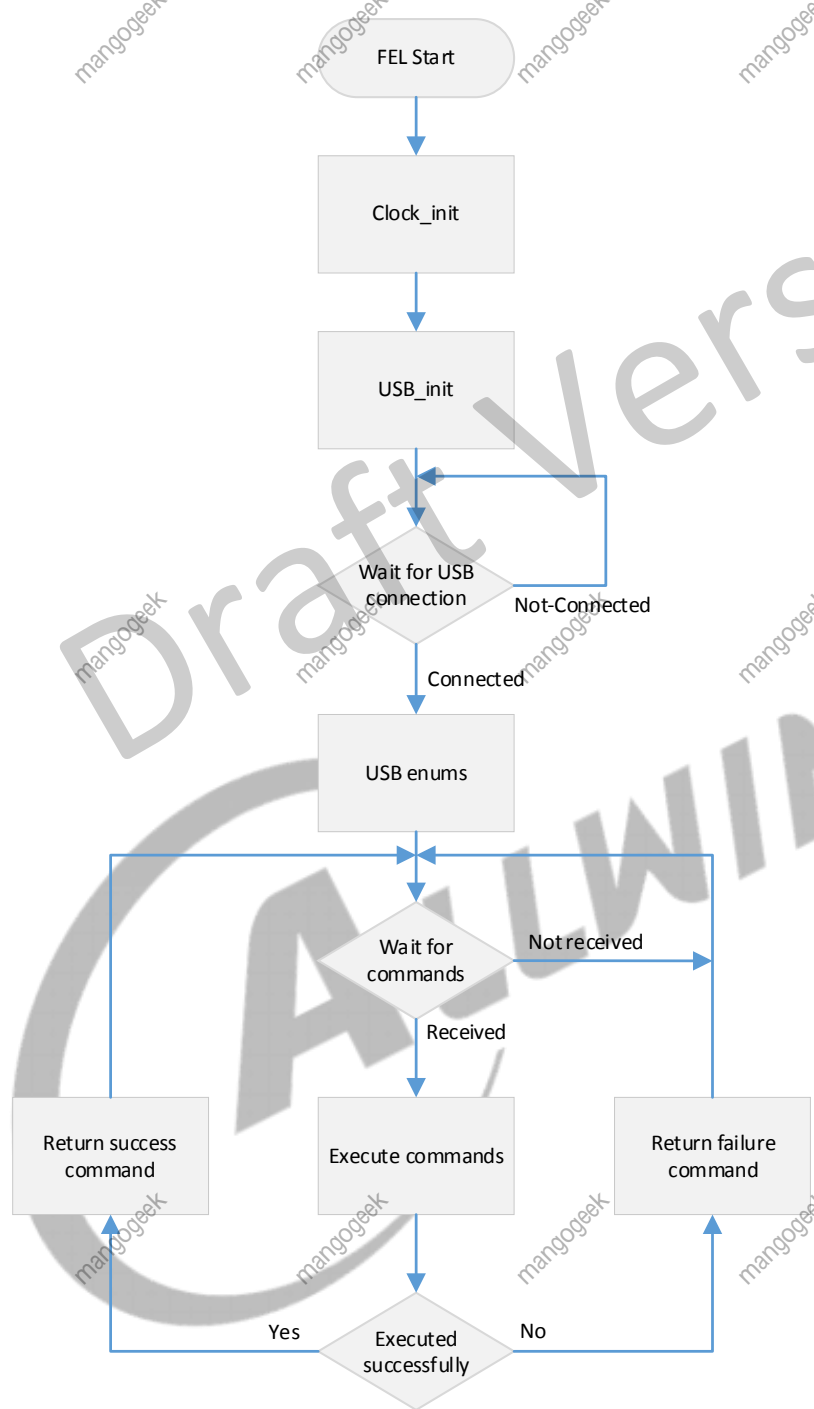

NOTE

- The FEL address of the Normal BROM is 0x20.
- The FEL address of the Secure BROM is 0x64.
- The status of the FEL pin is the bit[8] of the SYSCTRL_REG (0x03000024).

FEL Process

When the system chooses to enter the Mandatory Upgrade Process, the system will jump to the FEL process. The following figure shows the FEL upgrade process.

Figure 3-9 USB FEL Process

3.3.2.4 Fast Boot Process

If the value of the Fast Boot register (0x07090120) in RTC module is not zero, the system will enter the Fast Boot Process. The following table shows the boot medium priority for different values of the Fast Boot register.

Table 3-9 Fast Boot Select Setting

| Reg_bit[31:28] | Boot Medium Priority |
|----------------|--|
| 1 | Try process |
| 2 | SMHC0->EMMC2_USER->EMMC2_BOOT->Other media |
| 3 | SMHC0->SPI NOR->Other media |
| 4 | SMHC0->SPI NAND->Other media |
| 5 | EMMC2_BOOT->EMMC2_USER->Other media |
| 6 | SMHC0->Try process |
| 7 | SMHC0->Try process |

NOTE

- The bit[28:0] of Fast Boot register is used to record the media information.
- The try process is SMHC0->SPI NOR->SPI NAND->EMMC2_USER->EMMC2_BOOT.

3.4 System Configuration

3.4.1 Overview

The system configuration module is used to configure parameters for system domain.

3.4.2 Register List

| Module Name | Base Address |
|-------------|--------------|
| SYS_CFG | 0x03000000 |

| Register Name | Offset | Description |
|---------------------|--------|--|
| DSP_BOOT_RAMMAP_REG | 0x0008 | DSP Boot SRAM Remap Control Register |
| VER_REG | 0x0024 | Version Register |
| EMAC_EPHY_CLK_REG0 | 0x0030 | EMAC-EPHY Clock Register 0 |
| SYS_LDO_CTRL_REG | 0x0150 | System LDO Control Register |
| RESCAL_CTRL_REG | 0x0160 | Resistor Calibration Control Register |
| RES240_CTRL_REG | 0x0168 | 240ohms Resistor Manual Control Register |
| RESCAL_STATUS_REG | 0x016C | Resistor Calibration Status Register |

3.4.3 Register Description

3.4.3.1 0x0008 DSP Boot SRAM Remap Register (Default Value: 0x0000_0001)

| Offset: 0x0008 | | | Register Name: DSP_BOOT_RAMMAP_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:1 | / | / | / |
| 0 | R/W | 0x1 | DSP BOOT SRAM REMAP ENABLE 0: DSP 128K Local SRAM Remap for DSP_SYS 1: DSP 128K Local SRAM Remap for System Boot After system boots up, this bit must be set to 0 before using DSP. |

3.4.3.2 0x0024 Version Register (Default Value: UDF)

| Offset: 0x0024 | | | Register Name: VER_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:13 | / | / | / |
| 12:11 | R | UDF | BOOT_SEL_PAD_STA The value of this bit decides the priority order for each medium type to be selected as the boot media. |
| 10:9 | / | / | / |
| 8 | R | UDF | FEL_SEL_PAD_STA Fel_Select_Pin_Status 0: Run_FEL 1: Try Media Boot |
| 7:0 | / | / | / |

3.4.3.3 0x0030 EMAC-EPHY Clock Register 0 (Default Value: 0x0005_8000)

| Offset: 0x0030 | | | Register Name: EMAC_EPHY_CLK_REG0 |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:28 | R/W | 0x0 | BPS_EFUSE |
| 27 | R/W | 0x0 | XMII_SEL 0: Internal SMI and MII 1: External SMI and MII |
| 26:25 | R/W | 0x0 | EPHY_MODE Operation Mode Selection 00: Normal Mode 01: Simulation Mode 10: AFE Test Mode 11: Reserved |
| 24:20 | R/W | 0x0 | PHY_ADDR PHY Address |
| 19 | R/W | 0x0 | Reserved |
| 18 | R/W | 0x1 | CLK_SEL 0: 25 MHz 1: 24 MHz |

| Offset: 0x0030 | | | Register Name: EMAC_EPHY_CLK_REG0 |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 17 | R/W | 0x0 | LED_POL 0: High active 1: Low active |
| 16 | R/W | 0x1 | SHUTDOWN 0: Power up 1: Shut down |
| 15 | R/W | 0x1 | PHY_SELECT 0: External PHY 1: Internal PHY |
| 14 | / | / | / |
| 13 | R/W | 0x0 | RMII_EN 0: Disable RMII Module 1: Enable RMII Module This bit is prior to bit[2]. When this bit is asserted, the MII and RGMII interfaces will be both disabled. |
| 12:10 | R/W | 0x0 | ETXDC Configure EMAC Transmit Clock Delay Chain |
| 9:5 | R/W | 0x0 | ERXDC Configure EMAC Receive Clock Delay Chain |
| 4 | R/W | 0x0 | ERXIE Enable EMAC Receive Clock Invertor 0: Disabled 1: Enabled |
| 3 | R/W | 0x0 | ETXIE Enable EMAC Transmit Clock Invertor 0: Disabled 1: Enabled |
| 2 | R/W | 0x0 | EPIT EMAC PHY Interface Type 0: MII 1: RGMII |

| Offset: 0x0030 | | | Register Name: EMAC_EPHY_CLK_REG0 |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 1:0 | R/W | 0x0 | ETCS EMAC Transmit Clock Source 00: Transmit clock source for MII 01: External transmit clock source for GMII and RGMII 10: Internal transmit clock source for GMII and RGMII 11: Reserved |

3.4.3.4 0x0150 System LDO Control Register (Default Value: 0x0000_0E0F)

| Offset: 0x0150 | | | Register Name: SYS_LDO_CTRL_REG |

3.5 RISC-V System

3.5.1 Overview

The RISC-V system includes RISC-V IP core and related peripheral devices (RISCV_CFG, RISCV_TIMESTAMP, Watchdog, PSENSOR, MSGBOX, BROM, and so on), which are interconnected by BUS Matrix.

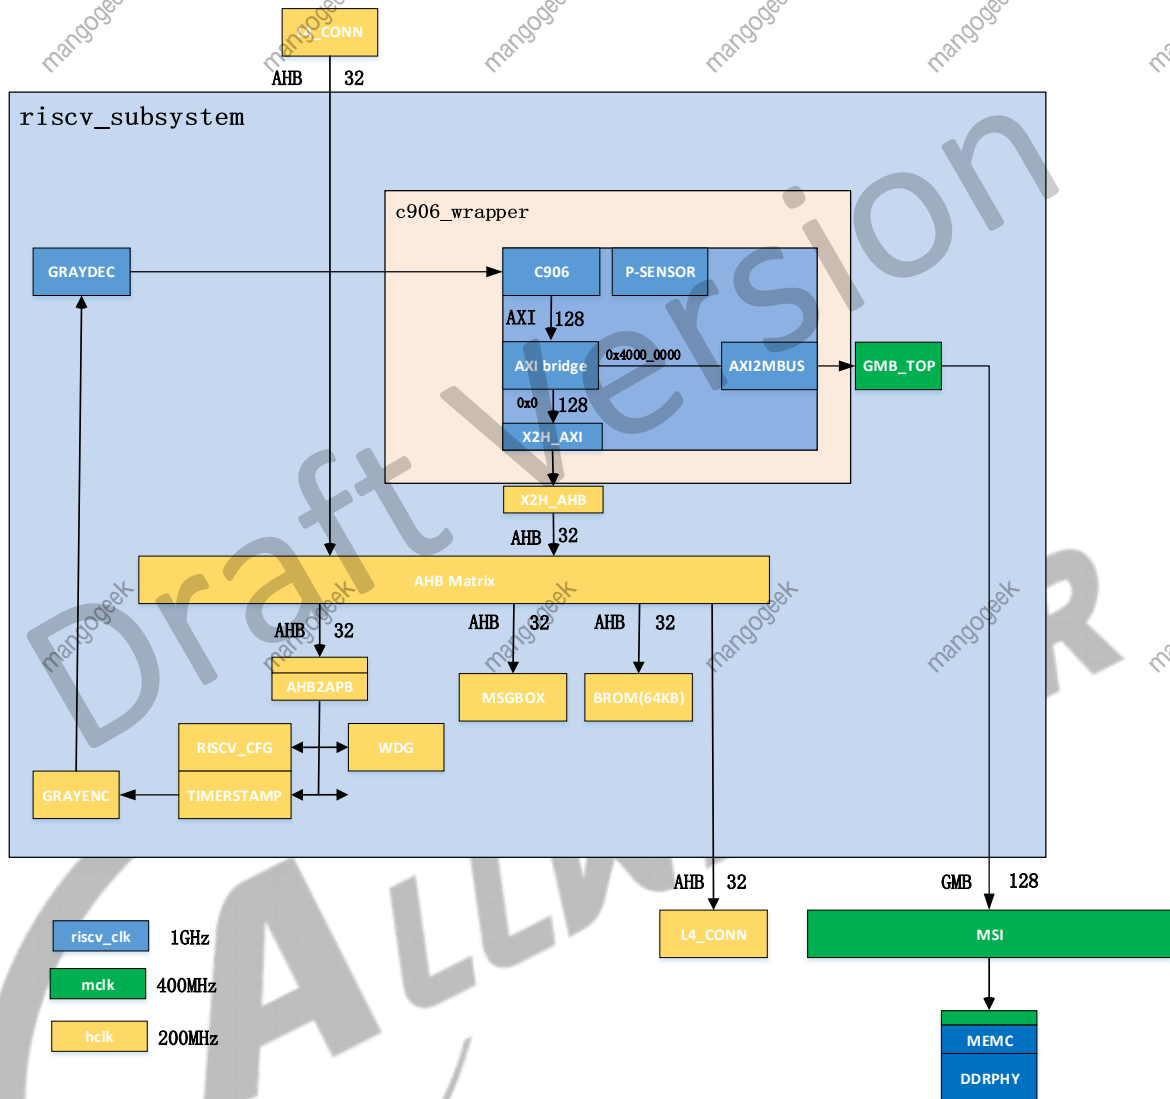

The RISC-V system has the following features:

- RISC-V 64GCV instruction architecture
- The 5-level single engine executes the pipeline in sequence
- Instruction and data cache of the first level Harvard, 32 KB I-cache + 32 KB D-cache, 64 B cacheline
- Instruction high-cache can configure parity, and data high-cache can configure ECC or parity
- Two-level TLB memory management unit to realize the virtual-real address translation and memory management
- Hardware automatic detection
- Supports AXI4.0 128-bit master interface
- Supports core-internal interrupt (CLINT) and interrupt controller (PLIC)
- Floating-point process unit
- Vector execution unit

3.5.2 Block Diagram

The following figure shows the block diagram of RISC-V system.

Figure 3-10 RISC-V System Block Diagram

3.5.3 Register List

| Module Name | Base Address |
|-------------|--------------|
| RISC_V_CFG | 0x06010000 |

| Register Name | Offset | Description |

| RISCV_AXI_PMU_REQ_WR | 0x0118 | RISCV AXI PMU Write Request Register |
| RISCV_AXI_PMU_BW_RD | 0x011C | RISCV AXI PMU Read Bandwidth Register |
| RISCV_AXI_PMU_BW_WR | 0x0120 | RISCV AXI PMU Write Bandwidth Register |

3.5.4 Register Description

3.5.4.1 0x0004 RISCV Start Address0 Register (Default Value: 0x0000_0000)

The 0x0004 register and 0x0008 register are grouped into a 40-bit address which is the running PC address after RISCV releases reset. Before releasing reset, this register should be configured. This register does support dynamic configuration.

| Offset: 0x0004 | | | Register Name: RISCV_STA_ADD0_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x00000000 | STA_ADD_L Start Address Low 32-bit The bit0 is fixed as 0 and can not be written. |

3.5.4.2 0x0008 RISCV Start Address1 Register (Default Value: 0x0000_0000)

| Offset: 0x0008 | | | Register Name: RISCV_STA_ADD1_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:8 | / | / | / |
| 7:0 | R/W | 0x00 | STA_ADD_H Start Address High 8-bit. |

3.5.4.3 0x0010 RF1P Configuration Register (Default Value: 0x0000_0013)

| Offset: 0x0010 | | | Register Name: RF1P_CFG_REG |
|----------------|------------|-------------|--------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:8 | / | / | / |
| 7:0 | R/W | 0x13 | RF1P_CFG RF1P Configuration |

3.5.4.4 0x001C ROM Configuration Register (Default Value: 0x0000_0002)

| Offset: 0x001C | | | Register Name: ROM_CFG_REG |
|----------------|------------|-------------|------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:8 | / | / | / |
| 7:0 | R/W | 0x02 | ROM_CFG ROM Configuration |

3.5.4.5 0x0020 Wakeup Enable Register (Default Value: 0x0000_0000)

| Offset: 0x0020 | | | Register Name: WAKEUP_EN_REG |
|----------------|------------|-------------|------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:1 | / | / | / |
| 0 | R/W | 0x0 | WP_EN Wakeup Enable |

3.5.4.6 0x0024 Wakeup Mask0 Register (Default Value: 0x0000_0000)

The 0x0024 to 0x0034 registers corresponds to the wakeup enable bits of 160 interrupts. These wakeup enable bits are disabled by default. When some interrupt needs to be waken-up, the corresponding bit needs to be set to 1.

| Offset: 0x0024 | | | Register Name: WAKEUP_MASK0_REG |
|----------------|------------|-------------|---------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x00000000 | WP_MASK0 Wakeup Mask0 |

3.5.4.7 0x0028 Wakeup Mask1 Register (Default Value: 0x0000_0000)

The 0x0024 to 0x0034 registers corresponds to the wakeup enable bits of 160 interrupts. These wakeup enable bits are disabled by default. When some interrupt needs to be waken-up, the corresponding bit needs to be set to 1.

| Offset: 0x0028 | | | Register Name: WAKEUP_MASK1_REG |
|----------------|------------|-------------|---------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x00000000 | WP_MASK1 Wakeup Mask1 |

3.5.4.8 0x002C Wakeup Mask2 Register (Default Value: 0x0000_0000)

The 0x0024 to 0x0034 registers corresponds to the wakeup enable bits of 160 interrupts. These wakeup enable bits are disabled by default. When some interrupt needs to be waken-up, the corresponding bit needs to be set to 1.

| Offset: 0x002C | | | Register Name: WAKEUP_MASK2_REG |
|----------------|------------|-------------|---------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x00000000 | WP_MASK2 Wakeup Mask2 |

3.5.4.9 0x0030 Wakeup Mask3 Register (Default Value: 0x0000_0000)

The 0x0024 to 0x0034 registers corresponds to the wakeup enable bits of 160 interrupts. These wakeup enable bits are disabled by default. When some interrupt needs to be waken-up, the corresponding bit needs to be set to 1.

| Offset: 0x0030 | | | Register Name: WAKEUP_MASK3_REG |
|----------------|------------|-------------|---------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x00000000 | WP_MASK3 Wakeup Mask3 |

3.5.4.10 0x0034 Wakeup Mask4 Register (Default Value: 0x0000_0000)

The 0x0024 to 0x0034 registers corresponds to the wakeup enable bits of 160 interrupts. These wakeup enable bits are disabled by default. When some interrupt needs to be waken-up, the corresponding bit needs to be set to 1.

| Offset: 0x0034 | | | Register Name: WAKEUP_MASK4_REG |
|----------------|------------|-------------|---------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x00000000 | WP_MASK4 Wakeup Mask4 |

3.5.4.11 0x0040 Timestamp Test Mode Select Register (Default Value: 0x0000_0000)

| Offset: 0x0040 | | | Register Name: TS_TMODE_SEL_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:1 | / | / | / |
| 0 | R/W | 0x0 | TS_TEST_MODE_EN Timestamp Test Mode Enable 0: Normal Mode 1: Test Mode |

3.5.4.12 0x0044 SRAM Address Twist Register (Default Value: 0x0000_0000)

| Offset: 0x0044 | | | Register Name: SRAM_ADDR_TWIST_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | W | UDF | SRAM_TS_KF SRAM Twist Keyfield The bit 0 can be written only if this key field is written by 0x16AA. |
| 15:1 | / | / | / |
| 0 | R/W | 0x0 | SRAM_ADDR_TS_FG. SRAM Address Twist Flag. When this bit is set up, the RISC_V_BROM area would become invisible, and the start address of SRAM A1 would be twisted into 0x0, the original start address of SRAM A1 is 0x0002_0000. After the address has been twisted, RISC_V reads data from 0x0002000 to 0x0002ffff as same as from 0x0 to 0xffff. |

3.5.4.13 0x0048 Work Mode Register (Default Value: 0x0000_0000)

| Offset: 0x0048 | | | Register Name: WORK_MODE_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:2 | / | / | / |
| 1:0 | R | 0x0 | WM_STA Work Mode Status 00: Normal Mode 01: Low Power Mode 10: Debug Mode 11: Reserved |

3.5.4.14 0x0050 Retire PC0 Register (Default Value: 0x0000_0000)

| Offset: 0x0050 | | | Register Name: RETITE_PC0_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | RT_PC_L Retire PC[31:0] It indicates the current retiring instruction PC[31:0]. |

3.5.4.15 0x0054 Retire PC1 Register (Default Value: 0x0000_0000)

| Offset: 0x0054 | | | Register Name: RETITE_PC1_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R | 0x0 | RT_SIG Retire Signal 0: The current period has not the retired instruction 1: The current period has the retired instruction |
| 30:8 | / | / | / |
| 7:0 | R | 0x0 | RT_PC_H Retire PC[39:31] It indicates the current retiring instruction PC[39:31]. |

3.5.4.16 0x0060 IRQ Mode0 Register (Default Value: 0x0000_0000)

| Offset: 0x0060 | | | Register Name: IRQ_MODE0_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x00000000 | IRQ_MD0 IRQ Mode0 0: High-level trigger 1: Rising edge trigger |

3.5.4.17 0x0064 IRQ Mode1 Register (Default Value: 0x0000_0000)

| Offset: 0x0064 | | | Register Name: IRQ_MODE1_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x00000000 | IRQ_MD1 IRQ Mode1 0: High-level trigger 1: Rising edge trigger |

3.5.4.18 0x0068 IRQ Mode2 Register (Default Value: 0x0000_0000)

| Offset: 0x0068 | | | Register Name: IRQ_MODE2_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x00000000 | IRQ_MD2 IRQ Mode2 0: High-level trigger 1: Rising edge trigger |

3.5.4.19 0x006C IRQ Mode3 Register (Default Value: 0x0000_0000)

| Offset: 0x006C | | | Register Name: IRQ_MODE3_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x00000000 | IRQ_MD3 IRQ Mode3 0: High-level trigger 1: Rising edge trigger |

3.5.4.20 0x0070 IRQ Mode4 Register (Default Value: 0x0000_0000)

| Offset: 0x0070 | | | Register Name: IRQ_MODE4_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x00000000 | IRQ_MD4 IRQ Mode4 0: High-level trigger 1: Rising edge trigger |

3.5.4.21 0x0104 RISC-V AXI PMU Control Register (Default Value: 0x0000_0000)

| Offset: 0x0104 | | | Register Name: RISC_V_AXI_PMU_CTRL |
|----------------|------------|-------------|------------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:2 | / | / | / |

| Offset: 0x0104 | | | Register Name: RISC_V_AXI_PMU_CTRL |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 1 | WC | 0x0 | PMU_CLR PMU Clear 0: No operation 1: PMU cleared |
| 0 | R/W | 0x0 | PMU_EN PMU Enable 0: PMU disabled 1: PMU enabled |

3.5.4.22 0x0108 RISC_V AXI PMU Period Register (Default Value: 0x0000_0000)

| Offset: 0x0108 | | | Register Name: RISC_V_AXI_PMU_PRD |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | PRD Monitor period Suggest that the field is in units of 1 us (1 ms). |

3.5.4.23 0x010C RISC_V AXI PMU Read Latency Register (Default Value: 0x0000_0000)

| Offset: 0x010C | | | Register Name: RISC_V_AXI_PMU_LAT_RD |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | LAT_RD Monitor the total latency of read-channel during period |

3.5.4.24 0x0110 RISC_V AXI PMU Write Latency Register (Default Value: 0x0000_0000)

| Offset: 0x0110 | | | Register Name: RISC_V_AXI_PMU_LAT_WR |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | LAT_WR Monitor the total latency of write-channel during period |

3.5.4.25 0x0114 RISC-V AXI PMU Read Request Register (Default Value: 0x0000_0000)

| Offset: 0x0114 | | | Register Name: RISC_V_AXI_PMU_REQ_RD |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | REQ_RD Monitor the total command numbers of read-channel during period |

3.5.4.26 0x0118 RISC-V AXI PMU Write Request Register (Default Value: 0x0000_0000)

| Offset: 0x0118 | | | Register Name: RISC_V_AXI_PMU_REQ_WR |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | REQ_WR Monitor the total command numbers of write-channel during period |

3.5.4.27 0x011C RISC-V AXI PMU Read Bandwidth Register (Default Value: 0x0000_0000)

| Offset: 0x011C | | | Register Name: RISC_V_AXI_PMU_BW_RD |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | BW_RD Monitor the total data (KB) of read-channel during period |

3.5.4.28 0x0120 RISC-V AXI PMU Write Bandwidth Register (Default Value: 0x0000_0000)

| Offset: 0x0120 | | | Register Name: RISC_V_AXI_PMU_BW_WR |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | BW_WR Monitor the total data (KB) of write-channel during period |

3.6 Timer

3.6.1 Overview

The timer module implements the timing and counting functions. The timer module includes timer0, timer1, watchdog and audio video synchronization (AVS).

The timer0 and timer1 are completely consistent. The main features for timer0 and timer1 are as follows:

- Alternative count clock: LOSC or OSC24M. The LOSC can be either the internal or external low-frequency clock, and the external one has more accuracy
- Supports 8 prescale factors
- Programmable 32-bit down timer
- Supports two timing modes: periodic mode and single counting mode
- Generates an interrupt when the count is decreased to 0

The watchdog is used to transmit a reset signal to reset the entire system when an exception occurs in the system. The main features for the watchdog are as follows:

- Single clock source: OSC24M/750
- Supports 12 initial values
- Supports the generation of timeout interrupts
- Supports the generation of reset signals
- Supports Watchdog Restart

The AVS is used to synchronize the audio and video. The AVS module includes AVS0 and AVS1, which are completely consistent. The main features for the AVS are as follows:

- Single clock source: OSC24M
- Programmable 33-bit up timer
- Supports updating the initial value anytime
- 12-bit frequency divider factor
- Supports Pause/Start function

3.6.2 Block Diagram

The following figure shows the functional block diagram of the timer module.

Figure 3-11 Timer Block Diagram

The watchdog, timer (including timer0 and timer1), and AVS are all mounted at the APBO bus. The system configures the parameters of their configure registers via APBO bus.

The timer and watchdog are both down counters and support generating interrupts after the counting value reaches 0.

For watchdog, the system is responsible for configuring the interval value. If the system fails to restart the watchdog regularly because of some exceptional situations, such as the bus hang, the watchdog will send out a Watchdog Reset External signal to reset the system. And the signal will be transmitted to the Reset pad to reset the PMIC.

3.6.3 Functional Description

3.6.3.1 Timer

The timer (including timer0 and timer1) is a 32-bit down counter. The counter value is decremented by 1 on each rising edge of the timer clock.

The following figure shows the block diagram for the timer.

Figure 3-12 Block Diagram for the Timer

The clock source for the timer can be either OSC24M or LOSC. For LOSC, it can be either the internal or external low-frequency clock. The external one has more accuracy.

Each timer has a prescale that divides the working clock frequency by 1, 2, 4, 8, 16, 32, 64, or 128. And each timer can generate independent interrupts.

Timing Modes

The timer has two timing modes: the single counting mode and periodic mode. You can configure the timing mode via the bit[7] of [TMRn_CTRL_REG](#) (n = 0 or 1). The value 0 is for the period mode and value 1 is for the single counting mode.

- Single Counting Mode

In the single counting mode, the timer starts counting from the interval value and generates an interrupt after the counter decreases to 0, and then stops counting. It starts to count again only when a new interval value is loaded.

- Periodic Mode

In the periodic mode, the timer restarts another round of counting after generating the interrupt. It reloads data from the [TMRn_INTV_VALUE_REG](#) and then continues to count.

Formula for Calculating the Timer

The following formula describes the relationship among timer parameters.

$$T_{\text{timer}} = \frac{\text{TMRn_INTV_VALUE_REG} - \text{TMRn_CUR_VALUE_REG}}{\text{TMRn_CLK_SRC}} \times \text{TMRn_CLK_PRES}$$

Where,

The parameter n is either 0 or 1;

T_{timer} is the remaining time of the timer;

TMRn_INTV_VALUE_REG is the interval value of the timer;

TMRn_CUR_VALUE_REG is the current value of the timer;

TMRn_CLK_SRC is the frequency of the timer clock source;

TMRn_CLK_PRES is the prescale ratio of the timer clock.

Initializing the Timer

Follow the steps below to initialize the timer:

Step 1 Configure the timer parameters clock source, prescale factor, and timing mode by writing [TMRn_CTRL_REG](#). There is no sequence requirement of configuring the parameters.

Step 2 Write the interval value.

- a) Write **TMRn INTV VALUE REG** to configure the interval value for the timer.
- b) Write bit[1] of **TMRn CTRL REG** to load the interval value to the timer. The value of the bit will be cleared automatically after loading the interval value.

Step 3 Write bit[0] of **TMRn CTRL REG** to start the timer. To get the current value of the timer, read **TMRn CUR VALUE REG**.

Processing the Interrupt

Follow the steps below to process the interrupt:

Step 1 Enable interrupts for the timer: write the enable bit of the corresponding interrupt in **TMR IRQ EN REG** for the timer. The timer will generate an interrupt everytime the count value reaches 0.

Step 2 After entering the interrupt process, write the pending bit of the corresponding interrupt in **TMR IRQ STA REG** to clear the interrupt pending, and execute the process of waiting for the interrupt.

Step 3 Resume the interrupt and continue to execute the interrupted process.

3.6.3.2 Watchdog

The watchdog is a 32-bit down counter. The counter value is decremented by 1 on each rising edge of the count clock.

The following figure shows the block diagram for the watchdog.

Figure 3-13 Block Diagram for the Watchdog

The clock source of the watchdog is OSC24M/750. There are 12 configurable initial count values.

Operating Modes

The watchdog has two operating modes: the interrupt mode and reset mode.

- In the interrupt mode, when the counter value reaches 0 and WDOG_IRQ_EN_REG is enabled, the watchdog generates an interrupt.
- In the reset mode, when the counter value reaches 0, the watchdog generates a reset signal to reset the entire system.

You can configure the operating mode for the watchdog via the bit[1:0] of the WDOG_CFG_REG. The value 0x2 is for the interrupt mode and the value 0x1 is for the reset mode.

Both the interrupt mode and reset mode support Watchdog Restart. You can make the watchdog to count from the initial value at any time by configuring the WDOG_CTRL_REG: write 0xA57 to bit[12:1], then write 1 to bit[0].

Initializing the Watchdog

Follow the steps below to initialize the watchdog:

- Step 1** Write the bit[1:0] of [WDOG_CFG_REG](#) to configure the watchdog operating mode so that the watchdog can generate interrupts or output reset signals.
- Step 2** Write the bit[7:4] of [WDOG_MODE_REG](#) to configure the initial count value.
- Step 3** Write the bit[0] of [WDOG_MODE_REG](#) to enable the watchdog.

Processing the Interrupt

In the interrupt mode, the watchdog is used as a counter. It generates an interrupt everytime the count value reaches 0.

Follow the steps below to process the interrupt:

- Step 1** Write the enable bit of [WDOG_IRQ_EN_REG](#) to enable the interrupt.
- Step 2** After entering the interrupt process, write the pending bit of [WDOG_IRQ_STA_REG](#) to clear the interrupt pending and execute the process of waiting for the interrupt.
- Step 3** Resume the interrupt and continue to execute the interrupted process.

3.6.3.3 AVS

The AVS is a 33-bit up counter. The counter value is increased by 1 on each rising edge of the count clock. There is a clock gate in [CCU](#) module to control the output of the AVS counter. To operate the AVS, open the clock gate first.

The following figure shows the block diagram for the AVS.

Figure 3-14 Block Diagram for the AVS

The clock source of the AVS is OSC24M. There is a 12-bit division factor for each AVS, N0 for AVS0 and N1 for AVS1. When the timer increases from 0 to N1 or N2, the AVS counter adds 1. When the counter reaches 33-bit upper limit, the AVS will start to count from the initial value again.

The AVS supports changing the initial value and division factor at anytime. And the AVS supports restarting from the initial value or pausing at anytime.

Starting or Pausing the AVS

Follow the steps below:

- Step 1** Write [AVS_CNT_DIV_REG](#) to configure the division factor.
- Step 2** Write [AVS_CNTn_REG](#) (n = 0 or 1) to configure the initial value.
- Step 3** Write [AVS_CNT_CTL_REG](#) to enable the AVS. You can pause the AVS at any time.

3.6.4 Programming Guidelines

3.6.4.1 Configuring the Timer

The following example shows how to make a one-millisecond delay with the clock source selected as OSC24M, the operating mode sets as single counting mode, and the pre-scale sets as 2.

```

writel(0x2EE0, TMR_0_INTV);           //Set the interval value
writel(0x94, TMR_0_CTRL);             //Select Single mode, 24 MHz clock source, 2 pre-scale
writel(readl(TMR_0_CTRL)|(1<<1), TMR_0_CTRL); //Set the Reload bit
while((readl(TMR_0_CTRL)>>1)&1);       //Waiting the Reload bit turns to 0
  
```

```
writel(readl(TMR_0_CTRL)|(1<<0), TMR_0_CTRL); //Enable Timer0
```

3.6.4.2 Resetting the Watchdog

The following example shows how to make the watchdog to generate a reset signal to the whole system after 1 second. The clock source for the watchdog is OSC24M/750.

```
writel(0x1, WDOG_CONFIG); //Set the operating mode as the reset mode.
writel(0x10, WDOG_MODE); //Set the interval value as 1 s.
writel(readl(WDOG_MODE)|(1<<0), WDOG_MODE); //Enable the Watchdog.
```

3.6.4.3 Restarting the Watchdog

The following example shows how to restart the watchdog. In this example, the clock source is OSC24M/750, the interval value is 1 second, and the watchdog operating mode is the reset mode.

If the execution time of “other codes” is shorter than 1 second, the watchdog will restart from the interval value before it count to zero and generates the reset signal. Otherwise, the watchdog will reset the whole system before the code “writel(readl(WDOG_CTRL)|(0xA57<<1)|(1<<0), WDOG_CTRL)” is executed.

```
writel(0x1, WDOG_CONFIG); //To whole system
writel(0x10, WDOG_MODE); //Interval Value set 1s
writel(readl(WDOG_MODE)|(1<<0), WDOG_MODE); //Enable Watchdog
---other codes---
writel(readl(WDOG_CTRL)|(0xA57<<1)|(1<<0), WDOG_CTRL); //Write 0xA57 at Key Field and Restart Watchdog
```

3.6.5 Register List

| Module Name | Base Address |
|-------------|--------------|
| Timer | 0x02050000 |

| Register Name | Offset | Description |
|-----------------|--------|---------------------------|
| TMR_IRQ_EN_REG | 0x0000 | Timer IRQ Enable Register |
| TMR_IRQ_STA_REG | 0x0004 | Timer Status Register |

| Register Name | Offset | Description |
|---------------------|--------|--|
| TMRO_CTRL_REG | 0x0010 | Timer0 Control Register |
| TMRO_INTV_VALUE_REG | 0x0014 | Timer0 Interval Value Register |
| TMRO_CUR_VALUE_REG | 0x0018 | Timer0 Current Value Register |
| TMR1_CTRL_REG | 0x0020 | Timer1 Control Register |
| TMR1_INTV_VALUE_REG | 0x0024 | Timer1 Interval Value Register |
| TMR1_CUR_VALUE_REG | 0x0028 | Timer1 Current Value Register |
| WDOG_IRQ_EN_REG | 0x00A0 | Watchdog IRQ Enable Register |
| WDOG_IRQ_STA_REG | 0x00A4 | Watchdog Status Register |
| WDOG_SOFT_RST_REG | 0x00A8 | Watchdog Software Reset Register |
| WDOG_CTRL_REG | 0x00B0 | Watchdog Control Register |
| WDOG_CFG_REG | 0x00B4 | Watchdog Configuration Register |
| WDOG_MODE_REG | 0x00B8 | Watchdog Mode Register |
| WDOG_OUTPUT_CFG_REG | 0x00BC | Watchdog Output Configuration Register |
| AVS_CNT_CTL_REG | 0x00C0 | AVS Control Register |
| AVS_CNT0_REG | 0x00C4 | AVS Counter 0 Register |
| AVS_CNT1_REG | 0x00C8 | AVS Counter 1 Register |
| AVS_CNT_DIV_REG | 0x00CC | AVS Divisor Register |

3.6.6 Register Description

3.6.6.1 0x0000 Timer IRQ Enable Register (Default Value: 0x0000_0000)

| Offset: 0x0000 | | | Register Name: TMR_IRQ_EN_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:2 | / | / | / |
| 1 | R/W | 0x0 | TMR1_IRQ_EN Timer1 Interrupt Enable 0: Disabled 1: Enabled |
| 0 | R/W | 0x0 | TMRO_IRQ_EN Timer0 Interrupt Enable 0: Disabled 1: Enabled |

3.6.6.2 0x0004 Timer IRQ Status Register (Default Value: 0x0000_0000)

| Offset: 0x0004 | | | Register Name: TMR_IRQ_STA_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:2 | / | / | / |
| 1 | R/W1C | 0x0 | <p>TMR1_IRQ_PEND</p> <p>The IRQ pending bit for Timer1</p> <p>0: No effect</p> <p>1: Pending, indicates that the interval value of the timer 1 is reached.</p> <p>Write 1 to clear the pending status.</p> |
| 0 | R/W1C | 0x0 | <p>TMR0_IRQ_PEND</p> <p>The IRQ pending bit for Timer0</p> <p>0: No effect</p> <p>1: Pending, indicates that the interval value of the timer 0 is reached.</p> <p>Write 1 to clear the pending status.</p> |

3.6.6.3 0x0010 Timer0 Control Register (Default Value: 0x0000_0004)

| Offset: 0x0010 | | | Register Name: TMR0_CTRL_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:8 | / | / | / |
| 7 | R/W | 0x0 | <p>TMR0_MODE</p> <p>Select the timing mode for timer0</p> <p>0: Periodic mode. When the interval value of the timer 0 is reached, the timer will restart another round of counting automatically.</p> <p>1: Single counting mode. When the interval value of the timer 0 is reached, the timer will stop counting.</p> |

| Offset: 0x0010 | | | Register Name: TMRO_CTRL_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 6:4 | R/W | 0x0 | <p>TMRO_CLK_PRES</p> <p>Select the pre-scale of timer0 clock source</p> <p>000: /1</p> <p>001: /2</p> <p>010: /4</p> <p>011: /8</p> <p>100: /16</p> <p>101: /32</p> <p>110: /64</p> <p>111: /128</p> |
| 3:2 | R/W | 0x1 | <p>TMRO_CLK_SRC</p> <p>Select the clock source for timer0</p> <p>00: LOSC</p> <p>01: OSC24M</p> <p>10: /</p> <p>11: /</p> |
| 1 | R/W | 0x0 | <p>TMRO_RELOAD</p> <p>Timer0 Reload</p> <p>0: No effect</p> <p>1: Reload the Interval value for timer0</p> <p>After the bit is set, it can not be written again before it is cleared automatically.</p> |
| 0 | R/W | 0x0 | <p>TMRO_EN</p> <p>Timer0 Enable</p> <p>0: Stop/Pause</p> <p>1: Start</p> <p>By setting the bit to 1, the timer will be started. It reloads the interval value register and then counts from the interval value to 0.</p> <p>By setting the bit to 0 before the timer counts to 0, the timer will be paused. The bit will be locked to 0 for at least 2 cycles. Within the 2 cycles, you cannot set the bit to 1 to restart the timer.</p> <p>The timer supports updating the interval value in the pause state. To start to down-count from the updated interval value, set both the reload bit and enable bit to 1.</p> <p>Additionally, in the single counting mode, after the count value reaches 0, the system will automatically change the bit to 0 to stop the timer.</p> |

3.6.6.4 0x0014 Timer0 Interval Value Register (Default Value: 0x0000_0000)

| Offset: 0x0014 | | | Register Name: TMR0_INTV_VALUE_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | TMR0_INTV_VALUE Timer0 Interval Value |

NOTE

Take the system clock and timer clock source into consideration when setting the interval value.

3.6.6.5 0x0018 Timer0 Current Value Register (Default Value: 0x0000_0000)

| Offset: 0x0018 | | | Register Name: TMR0_CUR_VALUE_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | TMR0_CUR_VALUE Timer0 Current Value Timer0 current value is a 32-bit down-counter (from interval value to 0). |

3.6.6.6 0x0020 Timer1 Control Register (Default Value: 0x0000_0004)

| Offset: 0x0020 | | | Register Name: TMR1_CTRL_REG |

| Offset: 0x00CC | | | Register Name: AVS_CNT_DIV_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 27:16 | R/W | 0x5DB | <p>AVS_CNT1_D</p> <p>N1, the divisor factor for AVS1. The clock for AVS1 is 24 MHz/N1. $N1 = \text{Bit}[27:16] + 1$. The valid value for N1 is from 1 to 0x7ff.</p> <p>There is an internal 12-bit counter maintained by the engine of the 33-bit AVS1. The 12-bit counter is used for counting the cycle number of the clock OSC24M. When the value of the 12-bit counter reaches N1, the internal 33-bit counter register will increase 1 and the 12-bit counter will reset to zero and restart again.</p> <p>You can change the value of N1 via the software at any time.</p> |
| 15:12 | / | / | / |
| 11:0 | R/W | 0x5DB | <p>AVS_CNT0_D</p> <p>N0, the divisor factor for AVS0. The clock for AVS0 is 24MHz/N0. $N0 = \text{Bit}[11:0] + 1$. The valid value for N0 is from 1 to 0x7ff.</p> <p>There is an internal 12-bit counter maintained by the engine of the 33-bit AVS0. The 12-bit counter is used for counting the cycle number of the clock OSC24M. When the value of the 12-bit counter reaches N0, the internal 33-bit counter register will increase 1 and the 12-bit counter will reset to zero and restart again.</p> <p>You can change the value of N0 via the software at any time.</p> |

3.7 High Speed Timer

3.7.1 Overview

The high speed timer (HSTimer) module consists of HSTimer0 and HSTimer1. HSTimer0 and HSTimer1 are down counters that implement timing and counting functions. They are completely consistent. Compared with the timer module, the HSTimer module provides more precise timing and counting.

The HSTimer has the following features:

- Single clock source: AHB0
- Supports 5 prescale factors
- Configurable 56-bit down timer
- Supports 2 timing modes: periodic mode and one-shot mode
- Supports the test mode
- Generates an interrupt when the count is decreased to 0

3.7.2 Block Diagram

The following figure shows the block diagram of the HSTimer.

Figure 3-15 HSTimer Block Diagram

3.7.3 Functional Description

The HSTimers are 56-bit down counters. The counter value is decremented by 1 on each rising edge of the count clock. Each HSTimer has a prescaler that divides the working clock frequency of each working timer by 1, 2, 4, 8, or 16.

3.7.3.1 Typical Application

The following figure shows a typical application of HSTimer module.

Figure 3-16 Typical Application for HSTimer

The HSTimer module is mounted at AHBO, and can control the registers via AHBO. AHBO is the clock source of the HSTimer. When the count value reaches zero, the HSTimer generates an interrupt.

3.7.3.2 Count Modes

The HSTimer has two count modes: one-shot mode and periodic mode. You can configure the timing mode via the bit[7] of [HS TMRn CTRL REG](#) (n = 0 or 1). The value 0 is for the period mode and value 1 is for the one-shot mode.

- One-shot Mode

When the count value of the HSTimer reaches 0, the HSTimer stops counting. The HSTimer starts to count again only when a new value is loaded.

- Periodic Mode

The HSTimer counts continuously. When the count value of the HSTimer reaches 0, the HSTimer reloads an initial value from [HS TMRn INTV LO REG](#) and [HS TMRn INTV HI REG](#) and then continues to count.

3.7.3.3 Operating Modes

The HSTimer has two operating modes: the normal mode and test mode. You can configure the operating mode via the bit[31] of [HS TMRn CTRL REG](#). The value 0 is for the normal mode and value 1 is for the test mode.

- Normal Mode

In the normal mode, the HSTimer is used as a 56-bit down counter, which can finish one-shot counting and periodic counting. The interval value for the HSTimer consists of two parts: [HS TMRn INTV LO REG](#) forms the bit[31:0] and [HS TMRn INTV HI REG](#) forms the bit[55:32]. To read or write the interval value, [HS TMRn INTV LO REG](#) should be done before [HS TMRn INTV HI REG](#).

- Test Mode

In the test mode, the HSTimer is used as a 24-bit down counter. [HS_TMRn_INTV_LO_REG](#) must be set to 0x1, and [HS_TMRn_INTV_HI_REG](#) acts as the initial value for the HSTimer.

3.7.3.4 HSTimer Formula

The following formula describes the relationship among HSTimer parameters in the normal mode.

$$T_{\text{HSTimer}} = \frac{(\text{HS_TMRn_INTV_HI_REG} \ll 32 + \text{HS_TMRn_INTV_LO_REG}) - (\text{HS_TMRn_CURNT_HI_REG} \ll 32 + \text{HS_TMRn_CURNT_LO_REG})}{\text{AHB0CLK}} \times \text{HS_TMRn_CLK}$$

Where,

The parameter n is either 0 or 1;

T_{HSTimer} is the remaining time of the timer;

HS_TMRn_INTV_HI_REG is bit[55:32] of the HSTimer interval value;

HS_TMRn_INTV_LO_REG is bit[31:0] of the HSTimer interval value;

HS_TMRn_CURNT_HI_REG is bit[55:32] of the HSTimer current value;

HS_TMRn_CURNT_LO_REG is bit[31:0] of the HSTimer current value;

AHB0CLK is the frequency of AHB0 Clock (the HSTimer clock source);

HS_TMRn_CLK is the prescale ratio of the HSTimer clock.

3.7.3.5 Initializing the HSTimer

The following figure shows the process of HSTimer initialization.

Figure 3-17 HSTimer Initialization Process

Step 1 AHB0 clock management: Open the clock gate of AHB0 and de-assert the soft reset of AHB0 in CCU.

Step 2 Configure the corresponding parameters of the HSTimer: clock source, prescaler factor, operating mode, and timing mode. There is no sequence requirement when writing the above parameters to [HS TMRn CTRL REG](#).

Step 3 Write the initial value: Write the lower 32 bits of the initial value to [HS TMRn INTV LO REG](#) first, and then the higher 24 bits to [HS TMRn INTV HI REG](#). Normally, write the bit[1] of [HS TMRn CTRL REG](#) to load the initial value. If the HSTimer is in the timing stop stage, write 1 to the bit[1] and bit[0] of [HS TMRn CTRL REG](#) at the same time to reload the initial value.

Step 4 Enable HSTimer: Write the bit[0] of [HS TMRn CTRL REG](#) to enable HSTimer to count.

Step 5 Reading [HS TMRn CURNT LO REG](#) and [HS TMRn CURNT HI REG](#) can get current counting value.

3.7.3.6 Processing the HSTimer Interrupt

Follow the steps below to process the HSTimer interrupt:

Step 1 Enable interrupt: Write the corresponding interrupt enable bit of [HS TMR IRQ EN REG](#), when the counting time of HSTimer reaches, the corresponding interrupt generates.

Step 2 After entering the interrupt process, write [HS TMR IRQ STAS REG](#) to clear the interrupt pending.

Step 3 Resume the interrupt and continue to execute the interrupted process.

3.7.4 Programming Guidelines

The following example shows how to make a 1 us delay with HSTimer0. The frequency of the AHB0 clock is 100 MHz, the operating mode is the normal mode, the timing mode is single counting mode, and the pre-scale is 2.

```

writel(0x32, HS_TMR0_INTV_LO); //Set bit[31:0] of the interval value as 0x32.
writel(0x0, HS_TMR0_INTV_HI); //Set bit[55:32] of the interval value as 0x0.
writel(0x90, HS_TMR0_CTRL);

//Set the operating mode as Normal Mode, the pre-scale as 2, and the timing mode as Single Counting Mode.

writel(readl(HS_TMR0_CTRL)|(1<<1), HS_TMR0_CTRL); //Set the reload bit.
writel(readl(HS_TMR0_CTRL)|(1<<0), HS_TMR0_CTRL); //Enable HSTimer0.
while(!(readl(HS_TMR_IRQ_STAS)&1)); //Wait for HSTimer0 to generate pending.
writel(1, HS_TMR_IRQ_STAS); //Clear HSTimer0 pending.

```

3.7.5 Register List

| Module Name | Base Address |
|-------------|--------------|
| HSTimer | 0x03008000 |

| Register Name | Offset | Description |
|----------------------|--------|--|
| HS_TMR_IRQ_EN_REG | 0x0000 | HS Timer IRQ Enable Register |
| HS_TMR_IRQ_STAS_REG | 0x0004 | HS Timer Status Register |
| HS_TMR0_CTRL_REG | 0x0020 | HS Timer0 Control Register |
| HS_TMR0_INTV_LO_REG | 0x0024 | HS Timer0 Interval Value Low Register |
| HS_TMR0_INTV_HI_REG | 0x0028 | HS Timer0 Interval Value High Register |
| HS_TMR0_CURNT_LO_REG | 0x002C | HS Timer0 Current Value Low Register |
| HS_TMR0_CURNT_HI_REG | 0x0030 | HS Timer0 Current Value High Register |
| HS_TMR1_CTRL_REG | 0x0040 | HS Timer1 Control Register |
| HS_TMR1_INTV_LO_REG | 0x0044 | HS Timer1 Interval Value Low Register |
| HS_TMR1_INTV_HI_REG | 0x0048 | HS Timer1 Interval Value High Register |
| HS_TMR1_CURNT_LO_REG | 0x004C | HS Timer1 Current Value Low Register |
| HS_TMR1_CURNT_HI_REG | 0x0050 | HS Timer1 Current Value High Register |

3.7.6 Register Description

3.7.6.1 0x0000 HS Timer IRQ Enable Register (Default Value: 0x0000_0000)

| Offset: 0x0000 | | | Register Name: HS_TMR_IRQ_EN_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:2 | / | / | / |
| 1 | R/W | 0x0 | HS_TMR1_INT_EN HSTimer1 Interrupt Enable 0: Disabled 1: Enabled |
| 0 | R/W | 0x0 | HS_TMR0_INT_EN HSTimer0 Interrupt Enable 0: Disabled 1: Enabled |

3.7.6.2 0x0004 HS Timer IRQ Status Register (Default Value: 0x0000_0000)

| Offset: 0x0004 | | | Register Name: HS_TMR_IRQ_STAS_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:2 | / | / | / |
| 1 | R/W1C | 0x0 | HS_TMR1_IRQ_PEND HSTimer1 IRQ Pending The IRQ pending bit for HSTimer1. Write 1 to clear the pending status. 0: No effect 1: Pending, indicates that the initial value of the HSTimer is reached. |
| 0 | R/W1C | 0x0 | HS_TMR0_IRQ_PEND HSTimer0 IRQ Pending The IRQ pending bit for HSTimer0. Write 1 to clear the pending status. 0: No effect 1: Pending, indicates that the initial value of the HSTimer is reached. |

3.7.6.3 0x0020 HS Timer0 Control Register (Default Value: 0x0000_0000)

| Offset: 0x0020 | | | Register Name: HS_TMRO_CTRL_REG |
|----------------|------------|-------------|--|

| Offset: 0x0020 | | | Register Name: HS_TMR0_CTRL_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 0 | R/W | 0x0 | <p>HS_TMR0_EN</p> <p>HSTimer0 Enable</p> <p>0: Stop/Pause</p> <p>1: Start</p> <p>By setting the bit to 1, the timer will be started. It reloads the interval value register and then counts from the interval value to 0.</p> <p>By setting the bit to 0 before the timer counts to 0, the timer will be paused. The bit will be locked to 0 for at least 2 cycles. Within the 2 cycles, you cannot set the bit to 1 to restart the timer.</p> <p>The timer supports updating the interval value in the pause state. To start from the updated interval value, set both the reload bit and enable bit to 1.</p> <p>Additionally, in the one-shot mode, after the count value reaches 0, the system will automatically change the bit to 0 to stop the timer.</p> |

3.7.6.4 0x0024 HS Timer0 Interval Value Lo Register (Default Value: 0x0000_0000)

| Offset: 0x0024 | | | Register Name: HS_TMR0_INTV_LO_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | <p>HS_TMR0_INTV_VALUE_LO</p> <p>Bit[31:0] of the HSTimer0 interval value.</p> |

3.7.6.5 0x0028 HS Timer0 Interval Value Hi Register (Default Value: 0x0000_0000)

| Offset: 0x0028 | | | Register Name: HS_TMR0_INTV_HI_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:24 | / | / | / |
| 23:0 | R/W | 0x0 | <p>HS_TMR0_INTV_VALUE_HI</p> <p>Bit[55:32] of the HSTimer0 interval value.</p> |

 **NOTE**

HSTimer0 is a 56-bit counter. The interval value consists of two parts: HS_TMRO_INTV_VALUE_LO acts as the bit[31:0] and HS_TMRO_INTV_VALUE_HI acts as the bit[55:32]. To read or write the interval value, HS_TMRO_INTV_LO_REG should be done before HS_TMRO_INTV_HI_REG.

3.7.6.6 0x002C HS Timer0 Current Value Lo Register (Default Value: 0x0000_0000)

| Offset: 0x002C | | | Register Name: HS_TMRO_CURNT_LO_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | HS_TMRO_CUR_VALUE_LO Bit[31:0] of the HSTimer0 current value. |

3.7.6.7 0x0030 HS Timer0 Current Value Hi Register (Default Value: 0x0000_0000)

| Offset: 0x0030 | | | Register Name: HS_TMRO_CURNT_HI_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:24 | / | / | / |
| 23:0 | R/W | 0x0 | HS_TMRO_CUR_VALUE_HI Bit[55:32] of the HSTimer0 current value. |

 **NOTE**

HSTimer0 is a 56-bit counter. The current value consists of two parts: HS_TMRO_CUR_VALUE_LO acts as the bit[31:0] and HS_TMRO_CUR_VALUE_HI acts as the bit[55:32]. To read or write the current value, HS_TMRO_CUR_VALUE_LO should be done before HS_TMRO_CUR_VALUE_HI.

3.7.6.8 0x0040 HS Timer1 Control Register (Default Value: 0x0000_0000)

| Offset: 0x0040 | | | Register Name: HS_TMR1_CTRL_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |

| 30:8 | / | / | / |
| 7 | R/W | 0x0 | <p>HS_TMR1_MODE</p> <p>Select the timing mode for HSTimer1.</p> <p>0: Periodic mode. When the count value is decreased to 0, the timer will restart another round of counting automatically.</p> <p>1: One-shot mode. When the count value is decreased to 0, the timer will stop counting.</p> |
| 6:4 | R/W | 0x0 | <p>HS_TMR1_CLK</p> <p>Select the pre-scale of the HSTimer1 clock sources.</p> <p>000: /1</p> <p>001: /2</p> <p>010: /4</p> <p>011: /8</p> <p>100: /16</p> <p>101: /</p> <p>110: /</p> <p>111: /</p> |
| 3:2 | / | / | / |
| 1 | R/W1S | 0x0 | <p>HS_TMR1_RELOAD</p> <p>HSTimer1 Reload</p> <p>0: No effect</p> <p>1: Reload the HSTimer1 interval value.</p> |

| Offset: 0x0040 | | | Register Name: HS_TMR1_CTRL_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 0 | R/W | 0x0 | <p>HS_TMR1_EN</p> <p>HSTimer1 Enable</p> <p>0: Stop/Pause</p> <p>1: Start</p> <p>By setting the bit to 1, the timer will be started. It reloads the interval value register and then counts from the interval value to 0.</p> <p>By setting the bit to 0 before the timer counts to 0, the timer will be paused. The bit will be locked to 0 for at least 2 cycles. Within the 2 cycles, you cannot set the bit to 1 to restart the timer.</p> <p>The timer supports updating the interval value in the pause state. To start from the updated interval value, set both the reload bit and enable bit to 1.</p> <p>Additionally, in the one-shot mode, after the count value reaches 0, the system will automatically change the bit to 0 to stop the timer.</p> |

3.7.6.9 0x0044 HS Timer1 Interval Value Lo Register (Default Value: 0x0000_0000)

| Offset: 0x0044 | | | Register Name: HS_TMR1_INTV_LO_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | <p>HS_TMR1_INTV_VALUE_LO</p> <p>Bit[31:0] of the HSTimer1 interval value</p> |

3.7.6.10 0x0048 HS Timer1 Interval Value Hi Register (Default Value: 0x0000_0000)

| Offset: 0x0048 | | | Register Name: HS_TMR1_INTV_HI_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:24 | / | / | / |
| 23:0 | R/W | 0x0 | <p>HS_TMR1_INTV_VALUE_HI</p> <p>Bit[55:32] of the HSTimer1 interval value</p> |

 **NOTE**

HSTimer1 is a 56-bit counter. The interval value consists of two parts: HS_TMR1_INTV_VALUE_LO acts as the bit[31:0] and HS_TMR1_INTV_VALUE_HI acts as the bit[55:32]. To read or write the interval value, HS_TMR1_INTV_LO_REG should be done before HS_TMR1_INTV_HI_REG.

3.7.6.11 0x004C HS Timer1 Current Value Lo Register (Default Value: 0x0000_0000)

| Offset: 0x004C | | | Register Name: HS_TMR1_CURNT_LO_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | HS_TMR1_CUR_VALUE_LO Bit[31:0] of the HSTimer1 current value |

3.7.6.12 0x0050 HS Timer1 Current Value Hi Register (Default Value: 0x0000_0000)

| Offset: 0x0050 | | | Register Name: HS_TMR1_CURNT_HI_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:24 | / | / | / |
| 23:0 | R/W | 0x0 | HS_TMR1_CUR_VALUE_HI Bit[55:32] of the HSTimer1 current value |

 **NOTE**

HSTimer1 is a 56-bit counter. The current value consists of two parts: HS_TMR1_CUR_VALUE_LO acts as the bit[31:0] and HS_TMR1_CUR_VALUE_HI acts as the bit[55:32]. To read or write the current value, HS_TMR1_CUR_VALUE_LO should be done before HS_TMR1_CUR_VALUE_HI.

3.8 Platform-Level Interrupt Controller (PLIC)

3.8.1 Overview

The PLIC is only used for sampling, priority arbitration and distribution for external interrupt sources.

- Sampling, priority arbitration and distribution for external interrupt sources
- The interrupt can be configured as machine mode and super user mode
- Up to 256 interrupt source sampling, supporting level interrupt and pulse interrupt
- 32 levels of interrupt priority
- Maintains independently the interrupt enable for each interrupt mode (machine/super user)
- Maintains independently the interrupt threshold for each interrupt mode (machine/super user)
- Configurable access permission for PLIC registers

3.8.2 Functional Description

The following table describes the details of interrupt sources.

Table 3-10 Interrupt Sources

| Interrupt Number | Interrupt Source | Interrupt Vector | Description |
|------------------|------------------|------------------|-------------|
| 0–15 | Reserved | 0x0000–0x003C | Not used |
| 16 | | 0x0040 | |
| 17 | | 0x0044 | |

3.8.3 Register List

| Module Name | Base Address |
|-------------|--------------|
| RISCV PLIC | 0x10000000 |

| Register Name | Offset | Description |
|-----------------|---------------------------|---|
| PLIC_PRIO_REGn | 0x0000+n*0x0004 (0<n<256) | PLIC Priority Register n |
| PLIC_IP_REGn | 0x1000+n*0x0004 (0≤n<9) | PLIC Interrupt Pending Register n |
| PLIC_MIE_REGn | 0x2000+n*0x0004 (0≤n<9) | PLIC Machine Mode Interrupt Enable Register n |
| PLIC_SIE_REGn | 0x2080+n*0x0004 (0≤n<9) | PLIC Superuser Mode Interrupt Enable Register n |
| PLIC_CTRL_REG | 0x1FFFC | PLIC Control Register |
| PLIC_MTH_REG | 0x200000 | PLIC Machine Threshold Register |
| PLIC_MCLAIM_REG | 0x200004 | PLIC Machine Claim Register |
| PLIC_STH_REG | 0x201000 | PLIC Superuser Threshold Register |
| PLIC_SCLAIM_REG | 0x201004 | PLIC Superuser Claim Register |

3.8.4 Register Description

3.8.4.1 0x0000+n*0x0004 (0<n<256) PLIC Priority Register n (Default Value: 0x0000_0000)

| Offset: 0x0000+n*0x0004 (0<n<256) | | | Register Name: PLIC_PRIO_REGn |
|-----------------------------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:1 | / | / | / |
| 0 | R/W | 0x0 | <p>PLIC_PRIO PLIC Priority</p> <p>Support for 32 different levels of priority.</p> <p>Where, a priority sets to 0 indicates that the interrupt is invalid. Machine mode interrupts have unconditionally higher priority than super-user mode interrupts. When the interrupt target mode is the same, priority 1 is the lowest priority, priority 31 is the highest priority. When multiple interrupts of the same priority are waiting arbitration, the interrupt source ID is compared. The smaller ID has the higher priority.</p> |

3.8.4.2 0x1000+n*0x0004 (0≤n<9) PLIC Interrupt Pending Register n (Default Value: 0x0000_0000)

| Offset: 0x1000+n*0x0004 (0≤n<9) | | | Register Name: PLIC_IP_REGn |

The PLIC starts to process the interrupt response.</p> <p>Write register: Indicate that the interrupt of the corresponding ID is complete. The writing operation can not update the response/completion register. The PLIC starts to process the interrupt completion.</p> |

3.9 Direct Memory Access Controller (DMAC)

3.9.1 Overview

The direct memory access (DMA) is a method of transferring data between peripherals and memories (including the SRAM and DRAM) without using the CPU. It is an efficient way to offload data transfer duties from the CPU. Without DMA, the CPU has to control all the data transfers. While with DMA, the DMAC directly transfers data between a peripheral and a memory, between peripherals, or between memories.

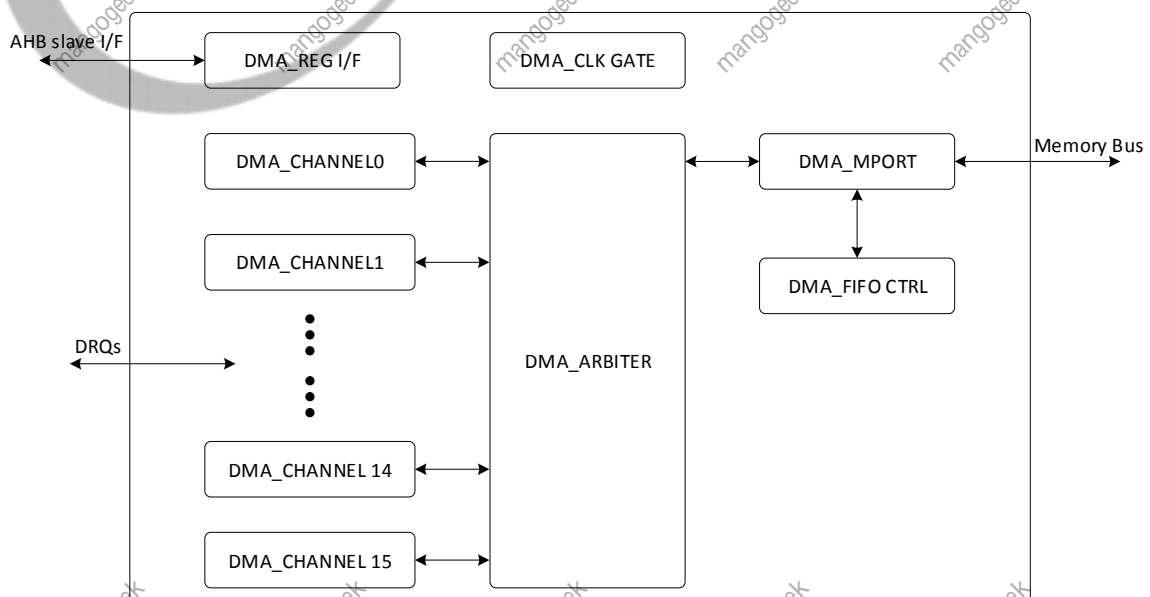

The DMAC has the following features:

- Up to 16 DMA channels
- Provides 32 peripheral DMA requests for data reading and 32 peripheral DMA requests for data writing
- Supports transferring data with a linked list
- Supports programmable 8-bit, 16-bit, 32-bit, and 64-bit data width
- Supports programmable DMA burst length
- DRQ response includes the waiting mode and handshake mode
- DMA channel supports pause function
- Memory devices support non-aligned transform

3.9.2 Block Diagram

The following figure shows a block diagram of DMAC.

Figure 3-18 DMAC Block Diagram

DMAC contains the following sub-blocks:

Table 3-11 DMAC Sub-blocks

| Sub-block | Description |
|-------------------|--|
| DMA_ARBITER | Arbitrates the DMA read/write requests from all channels, and converts the requests to the read/write requests of ports. |
| DMA_CHANNELS | DMA transfer engine. Each channel is independent. When the DMA requests from multiple peripherals are valid simultaneously, the channel with the highest priority starts data transfer first. The system uses the polling mechanism to decide the priorities of DMA channels. When DMA_ARBITER is idle, channel 0 has the highest priority, whereas channel 15 has the lowest priority. When DMA_ARBITER is busy processing the request from channel n, channel (n+1) has the highest priority. For n = 15, the channel (n + 1) should be channel 0. |
| DRQs | DMA requests. Peripherals use the DMA request signals to request a data transfer. |
| DMA_MPORT | Receives the read/write requests from DMA_ARBITER, and converts the requests to the corresponding MBUS access requests. It is mainly used for accessing the DRAM. |
| DMA_HPORT | The port for accessing the AHB Master. It is mainly used for accessing the SRAM and IO devices. |
| DMA_FIFO CTRL | Internal FIFO cell control module. |
| DMA_REG Interface | DMA_REG is the common register module that is mainly used to resolve AHB demands. |
| DMA_CLKGATE | The control module for hardware auto clock gating. |

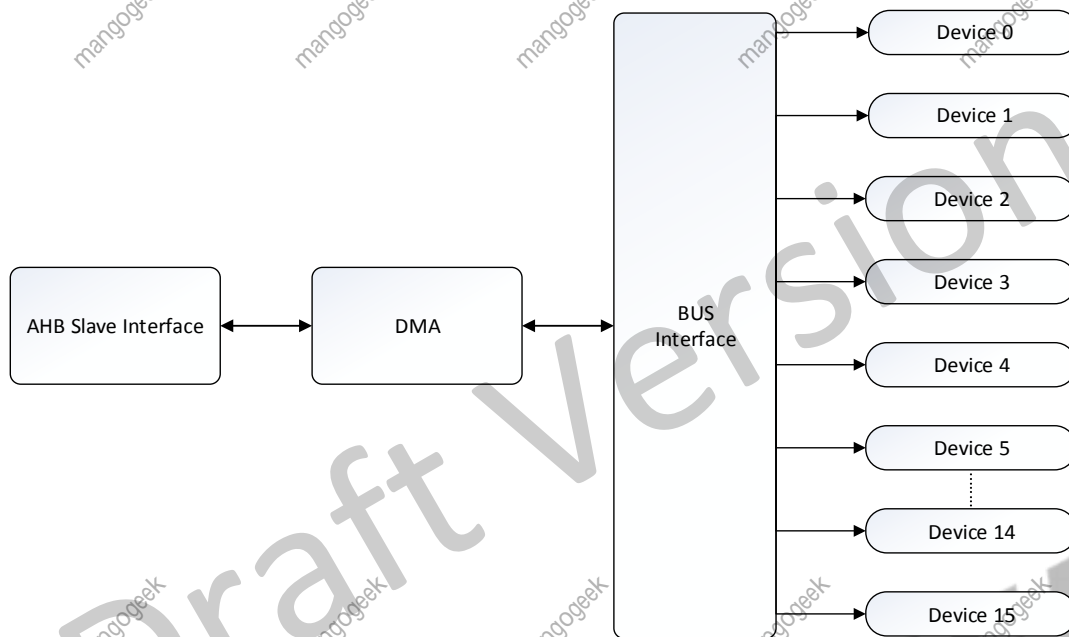

The DMAC integrates 16 independent DMA channels and each channel has an independent FIFO controller. When the DMA channel starts, the DMAC gets a DMA descriptor from the DMA_DESC_ADDR_REG and uses it as the configuration information for the data transfer of the current DMA package. Then the DMAC can transfer data between the specified devices. After transferring a DMA package, the DMAC judges if the current channel transfer is finished via the linked address in the descriptor. If the linked address shows all the packages are transferred, the DMAC will end the chain transmission and close the channel.

3.9.3 Functional Description

3.9.3.1 Typical Application

The following figure shows a typical application of the DMAC.

Figure 3-19 DMAC Typical Application Diagram

3.9.3.2 DRQ Port of Peripherals

The following table shows the source DRQ types and destination DRQ types of different ports.

Table 3-12 DMA DRQ Type

| Source DRQ Type | | Destination DRQ Type | |
|-----------------|-------------|----------------------|-------------|
| port0 | SRAM | port0 | SRAM |
| port1 | DRAM | port1 | DRAM |
| port2 | OWA-RX | port2 | OWA-TX |
| port3 | I2S/PCM0-RX | port3 | I2S/PCM0-TX |

3.9.3.3 DMA Descriptor

The DMAC descriptor is the configuration information of DMA transfer that decides the DMA working mode. Each descriptor includes 6 words: Configuration, Source Address, Destination Address, Byte Counter, Parameter, and Link. The following figure shows the structure of the DMA descriptor.

Figure 3-20 DMA Descriptor

| |
|---------------------|
| Configuration |
| Source Address |
| Destination Address |
| Byte Counter |
| Parameter |
| Link |

- **Configuration: Configure the following information by DMA_CFG_REG.**
 - DRQ type: DRQ type of the source and destination devices.
 - Address counting mode: For both the source and destination devices, there are two address counting modes: the IO mode and linear mode. The IO mode is for IO devices whose address is fixed during the data transfer and the linear mode is for the memory whose address is increasing during the data transfer.
 - Transferred block length: The amount of data that non-memory peripherals can transfer in a valid DRQ. The block length supports 1 bit, 4 bits, 8 bits, and 16 bits.
 - Transferred data width: The data width of operating the non-memory peripherals. The data width supports 8 bits, 16 bits, 32 bits, and 64 bits.

 **NOTE**

The configuration supports BMODE mode. The BMODE is used in the following scenario: the source is an IO device, and the destination is a memory device. Setting the BMODE mode can limit the amount of block data transferred in DMA block transmission to the amount of data transferred when the DRQ threshold of the source IO device is 1.

- **Source Address: Configure the address of the source device.**
- **Destination Address: Configure the address of the destination device.**

DMA reads data from the source address and then writes data to the destination address.

Both the DMA source and destination addresses have 34 bits. In the descriptor, because there are only 32 bits in the **Source/Destination Address** field, another 2 bits are stored in the **Parameter** field.

The following table shows the details of the related fields in the descriptor.

Table 3-13 Source/Destination Address Distribution

| Descriptor Group | Bit | Description |
|---------------------|-------|---|
| Source Address | 31:0 | DMA transfers the lower 32 bits of the 34-bit source address |
| Destination Address | 31:0 | DMA transfers the lower 32 bits of the 34-bit destination address |
| Parameter | 31:20 | Reserved |
| | 19:18 | DMA transfers the higher 2 bits of the 34-bit destination address |
| | 17:16 | DMA transfers the high 2 bits of the 34-bit source address |
| | 15:8 | Reserved |
| | 7:0 | Wait Clock Cycles Set the waiting time in DRQ mode |
| Link | 31:2 | The address of the next group descriptor, the lower 30 bits of the word address |
| | 1:0 | The address of the next group descriptor, the higher 2 bits of the word address |

From the above table, you can get:

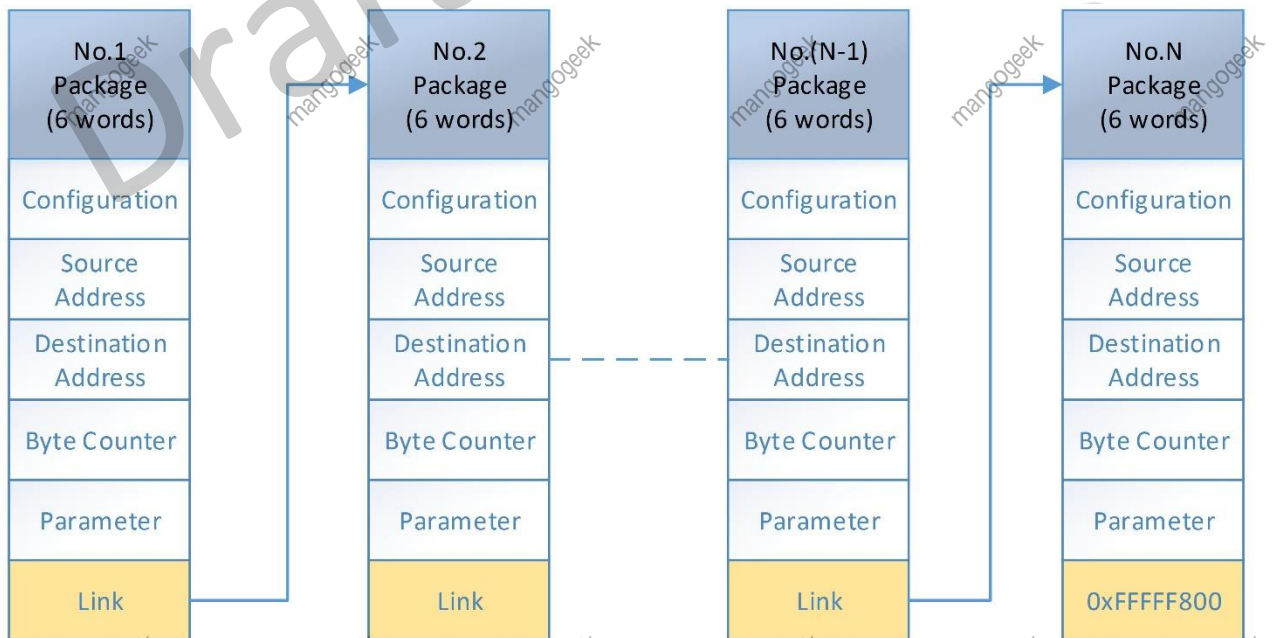

Real DMA source address (in byte mode) = {Parameter [17:16], Source Address [31:0]};

Real DMA destination address (in byte mode) = {Parameter [19:18], Destination Address [31:0]};

Real link address (in byte mode) = {Link[1:0], Link[31:2], 2'b00}.

- **Byte counter:** Configure the data amount of a package. The maximum value is $(2^{25}-1)$ bytes. If the data amount of the package reaches the maximum value, even if DRQ is valid, the DMA will stop the current transfer.
- **Parameter:** Configure the interval between the data block. The parameter is valid for non-memory peripherals. When DMA detects that the DRQ is high, the DMA transfers the data block and ignores the status changes of the DRQ until the data transfer finishes. After that, the DMA waits for certain clock cycles (WAIT_CYC) and executes the next DRQ detection.
- **Link:** If the value of the link is 0xFFFFF800, the current package is at the end of the linked list. The DMAC will stop the data transfer after transferring the package; otherwise, the value of the link is considered as the descriptor address of the next package.

Figure 3-21 DMA Chain Transfer

3.9.3.4 Interrupts

There are three kinds of DMA interrupts: the half package interrupt, package end interrupt, and queue end interrupt.

Half package interrupt: When enabled, the DMAC sends out a half package interrupt after transferring half of a package.

Package end interrupt: When enabled, the DMAC sends out a package end interrupt after transferring a complete package.

Queue end interrupt: When enabled, the DMAC sends out a queue end interrupt after transferring a complete queue.

Notice that when CPU does not respond to the interrupts timely, or two DMA interrupts are generated very closely, the later interrupt may override the former one. That is, from the perspective of the CPU, the DMAC has only a system interrupt source.

NOTE

The DMAC has 16 channels and 2 groups of interrupts. The channel [7:0] corresponds to one group of interrupt, the channel [15:8] corresponds to another group of interrupt. The DSP is fixed to use the interrupt of the channel [15:8].

3.9.3.5 Clock Gating

The DMA_CLK_GATE module is a hardware module for controlling the clock gating automatically. It provides clock sources for sub-modules in DMAC and the module local circuits.

The DMA_CLK_GATE module consists of two parts: the channel clock gate and the common clock gate.

Channel clock gate: Controls the DMA clock of the DMA channels. When the system accesses the register of the current DMA channel and the DMA channel is enabled, the channel clock gate automatically opens the DMA clock. With a 16-HCLK-cycle delay after the system finishes accessing the register or the DMA data transfer is completed, the channel clock gate automatically closes the DMA clock. Also, the clock for the related circuits, such as for the channel control and FIFO control modules, will be closed.

Common clock gate: Controls the clocks of the DMA common circuits. The common circuits include the common circuit of the FIFO control module, MPORT module, and MBUS. When all the DMA channels are enabled, the common clock gate automatically closes the clocks for the above circuits.

The DMA clock gating can support all the functions stated above or not by software.

3.9.3.6 Transfer Mode

The peripherals initiate data transfer by transmitting DMA request signals to the DMAC. After receiving the request signal, the DMAC converts it to the internal DRQ signal and controls the DMA data transfer.

The DMAC supports two data transfer modes: the waiting mode and handshake mode.

The principle of waiting mode

- When the DMAC detects a valid external request signal, the DMAC starts to operate the peripheral device. The internal DRQ always holds high before the transferred data amount reaches the transferred block length.
- When the transferred data amount reaches the transferred block length, the internal DRQ pulls low automatically.
- The internal DRQ holds low for certain clock cycles (WAIT_CYC), and then the DMAC restarts to detect the external requests. If the external request signal is valid, then the next transfer starts.

The principle of handshake mode

- When the DMAC detects a valid external request signal, the DMAC starts to operate the peripheral device. The internal DRQ always holds high before the transferred data amount reaches the transferred block length.
- When the transferred data amount reaches the transferred block length, the internal DRQ will be pulled down automatically. For the last data transfer of the block, the DMAC sends a DMA Last signal with the DMA commands to the peripheral device. The DMA Last signal will be packed as part of the DMA commands and transmitted on the bus. It is used to inform the peripheral device that it is the end of the data transfer for the current DRQ.
- When the peripheral device receives the DMA Last signal, it can judge that the data transfer for the current DRQ is finished. To continue the data transfer, it sends a DMA Active signal to the DMAC.

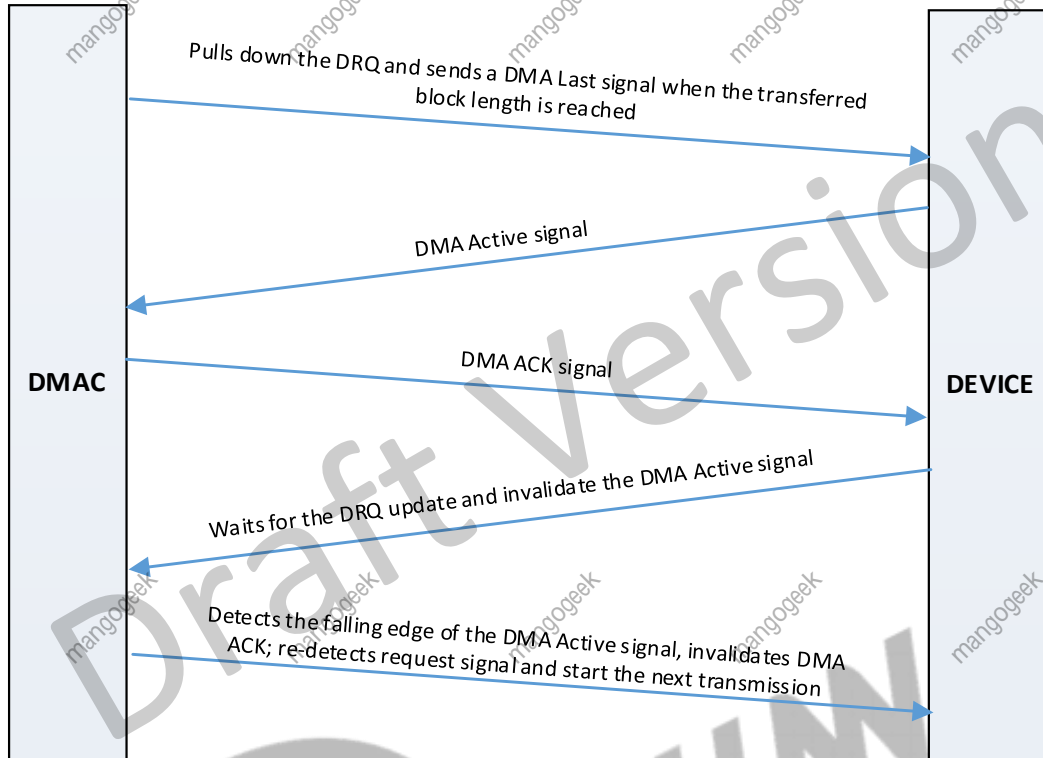

NOTE

One DMA Active signal will be converted to one DRQ signal in the DMA module. To generate multiple DRQs, the peripheral device needs to send out multiple DMA Active signals via the bus protocol.

- When the DMAC received the DMA Active signal, it sends back a DMA ACK signal to the peripheral device.
- When the peripheral device receives the DMA ACK signal, it waits for all the operations on the local device completed, and both the FIFO and DRQ status refreshed. Then it invalidates the DMA Active signal.
- When the DMAC detects the falling edge of the DMA Active signal, it invalidates the corresponding DMA ACK signal, and restarts to detect the external request signals. If a valid request signal is detected, the next data transfer starts.

The following figure shows the workflow of the handshake mode.

Figure 3-22 Workflow of the DMAC Handshake Mode

3.9.3.7 Address Auto-Alignment

For the non-IO devices whose start address is not 32-byte-aligned, the DMAC will adjust the address to 32-byte-aligned through the burst transfer within 32 bytes. Adjusting address to 32-byte-aligned improves the DRAM access efficiency.

The following example shows how the DMAC adjusts the address: when the peripheral device of a DMA channel is a non-IO device whose start address is 0x86 (not 32-byte-aligned), the DMAC firstly uses a 26-byte burst transfer to align the address to 0xA0 (32-byte-aligned), and then transfers data by 64-byte burst (the maximum transfer amount that MBUS allows).

The IO devices do not support address alignment, so the bit width of IO devices must match the address offset; otherwise, the DMAC will ignore the inconsistency and directly transmit data of the corresponding bit width to the address.

The address of the DMA descriptor does not support the address auto-alignment. Make sure the address is word-aligned; otherwise the DMAC cannot identify the descriptor.

3.9.3.8 DMAC Clock Control

- The DMAC clock is synchronous with the AHB1 clock. Make sure that the DMAC gating bit of AHB1 clock is enabled before accessing the DMAC register.
- The reset input signal of the DMAC is asynchronous with AHB1 and is low valid by default. Make sure that the reset signal of the DMAC is de-asserted before accessing the DMA register.
- To avoid the indefinite state within registers, de-assert the reset signal first, and then open the gating bit of AHB1.
- The DMAC supports Clock Auto Gating function to reduce power consumption, the system will automatically disable the DMAC clock in the DMAC idle state. Clock Auto Gating is enabled by default.

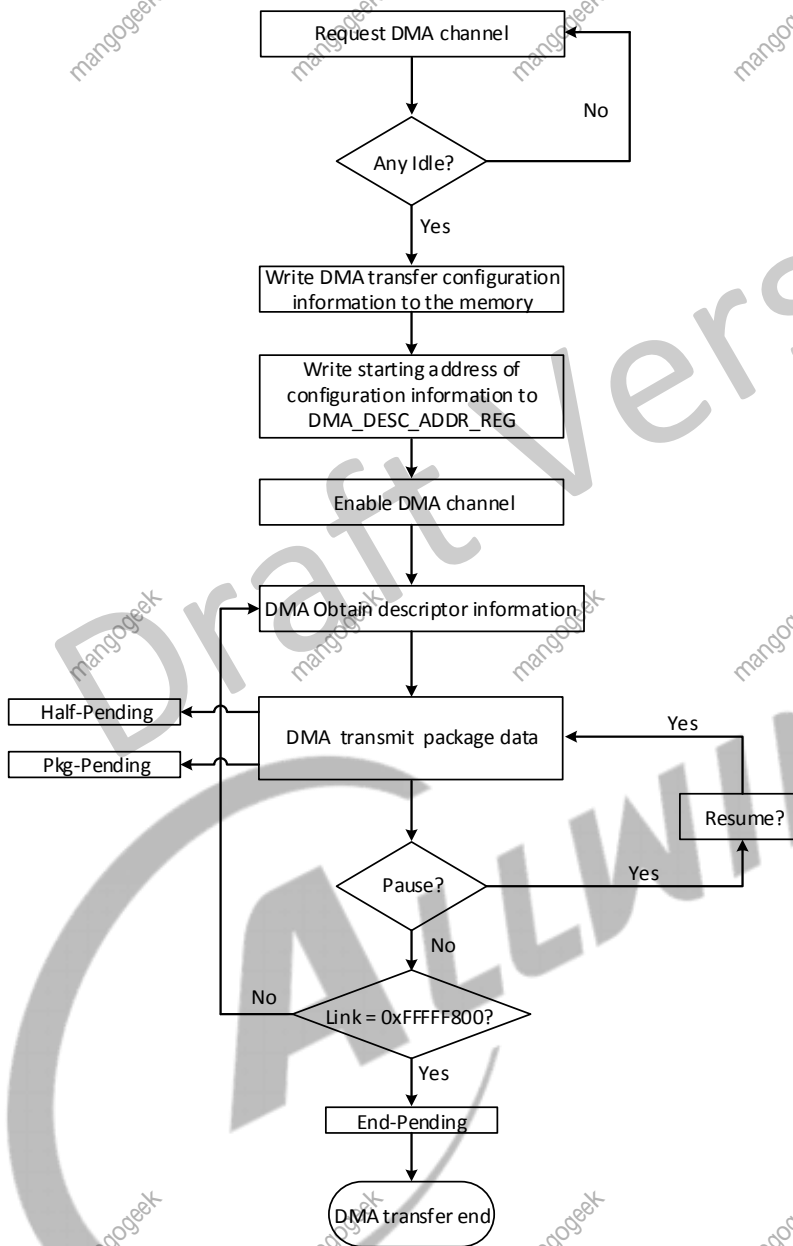

3.9.4 Programming Guidelines

3.9.4.1 Using DMAC Transfer Process

The DMAC transfer process is as follows.

- Step 1** Request DMA channel, and check if the DMA channel is idle by checking if it is enabled. A disabled channel indicates it is idle, while an enabled channel indicates it is busy.
- Step 2** Write the descriptor with 6 words into the memory. The descriptor must be word-aligned. For more details, refer to section 3.9.3.3 "[DMA Descriptor](#)".
- Step 3** Write the start address of the descriptor to [DMA_DESC_ADDR_REGN](#).
- Step 4** Enable the DMA channel, and write the corresponding channel to [DMAC_EN_REGN](#).
- Step 5** The DMA obtains the descriptor information.
- Step 6** Start to transmit a package. When half of the package is completed, the DMA sends a Half Package Transfer Interrupt; when a total package is completed, the DMA sends a Package End Transfer Interrupt. These interrupt status can be read by [DMAC_IRQ_PEND_REGO](#).
- Step 7** Set [DMAC_PAU_REGN](#) to pause or resume the data transfer.
- Step 8** After completing a total package transfer, the DMA decides to start the next package transfer or end the transfer by the link of the descriptor. If the link is 0xFFFFF800, the transfer ends; otherwise, the next package starts to transmit. When the transfer ends, the DMA sends a Queue End Transfer Interrupt.
- Step 9** Disable the DMA channel.

Figure 3-23 DMAC Transfer Process

3.9.4.2 Processing DMAC Interrupt

Follow the steps below to process the DMAC interrupt:

Step 1 Enable interrupt: write the corresponding interrupt enable bit of [DMAC_IRQ_EN_REGO](#). The system generates an interrupt when the corresponding condition is satisfied.

Step 2 After entering the interrupt process, write [C:\Users\chenxiaofang\AppData\Roaming\Microsoft\Word\ Hlk52357013 - Hlk52357103](#) to clear the interrupt pending and execute the process of waiting for the interrupt.

Step 3 Resume the interrupt and continue to execute the interrupted process.

3.9.4.3 Configuring DMAC

To configure the DMAC, follow the guidelines below:

- Make sure the transfer bit width of IO devices is consistent with the offset of the start address.
- The MBUS protocol does not support the read operation of non-integer words. For the devices whose bit width is not word-aligned, after receiving the read command, they should resolve the read command according to their FIFO bit width instead of the command bit width, and ignore the redundant data caused by the inconsistency of the bit width.
- When the DMA transfer is paused, this is equivalent to invalid DRQ. Because there is a certain time delay between DMA transfer commands, the DMAC will not stop data transfer until the DMAC finishes processing the current command and the commands in Arbiter (at most 32 bytes data).

DMAC application example:

```
writel(0x00000000, mem_address + 0x00); //Set configurations. The mem_address must be word-aligned.
writel(0x00001000, mem_address + 0x04); // Set the start address for the source device.
writel(0x20000000, mem_address + 0x08); //Set the start address for the destination device.
writel(0x00000020, mem_address + 0x0C); // Set the data package size.
writel(0x00000000, mem_address + 0x10); //Set the parameters.
writel(0xFFFFF800, mem_address + 0x14); //Set the start address for the next descriptor.
writel(mem_address, 0x01C02000+ 0x100 + 0x08); //Set the start address for the DMA channel0 descriptor.
do{
If(mem_address == readl(0x01C02000 + 0x100 + 0x08));
break;
}while(1); //Make sure that the writing operation is valid.
writel(0x00000001, 0x01C02000 + 0x100 + 0x00); // Enable DMA channel0 transfer.
```

The DMAC supports increasing data package in transfer, pay attention to the following points:

- The 0xFFFFF800 value of [DMAC FDESC ADDR REGN](#) indicates that the DMA channel has got back the descriptor of the last package. The DMA channel will automatically stop the data transfer after transferring the current package.
- To add a package during the data transfer, check if the DMA channel has got back the descriptor of the last package. If yes, you cannot add any package in the current queue. Request another DMA channel with

a new DRQ to transfer the package. Otherwise, you can add the package by modifying the [DMAC_FDESC_ADDR_REGN](#) of the last package from 0xFFFFF800 to the start address of the to-be-added package.

To ensure that the modification is valid, read the value of [DMAC_FDESC_ADDR_REGN](#) after the modification. The value 0xFFFFF800 indicates the modification fails and the other values indicate you have successfully added packages to the queue.

Another problem is, the system needs some time to process the modification, during which the DMA channel may get back the descriptor of the last package. You can read [DMAC_CUR_SRC_REGN](#) and [DMAC_CUR_DEST_REGN](#) and check if the increasing memory address accords with the information of the added package. If yes, the package is added successfully; otherwise, the modification failed.

To ensure a higher rate of success, it is suggested that you add the package before the half package interrupt of the penultimate package.

3.9.5 Register List

| Module Name | Base Address |
|-------------|--------------|
| DMAC | 0x03002000 |

| Register Name | Offset | Description |
|---------------------|-------------------|---|
| DMAC_IRQ_EN_REG0 | 0x0000 | DMAC IRQ Enable Register 0 |
| DMAC_IRQ_EN_REG1 | 0x0004 | DMAC IRQ Enable Register 1 |
| DMAC_IRQ_PEND_REG0 | 0x0010 | DMAC IRQ Pending Register 0 |
| DMAC_IRQ_PEND_REG1 | 0x0014 | DMAC IRQ Pending Register 1 |
| DMAC_AUTO_GATE_REG | 0x0028 | DMAC Auto Gating Register |
| DMAC_STA_REG | 0x0030 | DMAC Status Register |
| DMAC_EN_REGN | 0x0100 + N*0x0040 | DMAC Channel Enable Register N (N = 0 to 15) |
| DMAC_PAU_REGN | 0x0104 + N*0x0040 | DMAC Channel Pause Register N (N = 0 to 15) |
| DMAC_DESC_ADDR_REGN | 0x0108 + N*0x0040 | DMAC Channel Start Address Register N (N = 0 to 15) |
| DMAC_CFG_REGN | 0x010C + N*0x0040 | DMAC Channel Configuration Register N (N = 0 to 15) |
| DMAC_CUR_SRC_REGN | 0x0110 + N*0x0040 | DMAC Channel Current Source Register N (N = 0 to 15) |
| DMAC_CUR_DEST_REGN | 0x0114 + N*0x0040 | DMAC Channel Current Destination Register N (N = 0 to 15) |
| DMAC_BCNT_LEFT_REGN | 0x0118 + N*0x0040 | DMAC Channel Byte Counter Left Register N (N = 0 to 15) |
| DMAC_PARA_REGN | 0x011C + N*0x0040 | DMAC Channel Parameter Register N (N = 0 to 15) |

| Register Name | Offset | Description |
|----------------------|-------------------|---|
| DMAC_MODE_REGN | 0x0128 + N*0x0040 | DMAC Mode Register N (N = 0 to 15) |

3.9.6 Register Description

3.9.6.1 0x0000 DMAC IRQ Enable Register0 (Default Value: 0x0000_0000)

| Offset: 0x0000 | | | Register Name: DMAC_IRQ_EN_REG0 |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31 | / | / | / |
| 30 | R/W | 0x0 | DMA7_QUEUE_IRQ_EN Enable the queue end interrupt of DMA channel 7 0: Disabled 1: Enabled |
| 29 | R/W | 0x0 | DMA7_PKG_IRQ_EN Enable the package end interrupt of DMA channel 7 0: Disabled 1: Enabled |
| 28 | R/W | 0x0 | DMA7_HLAF_IRQ_EN Enable the half package interrupt of DMA channel 7 0: Disabled 1: Enabled |
| 27 | / | / | / |
| 26 | R/W | 0x0 | DMA6_QUEUE_IRQ_EN Enable the queue end interrupt of DMA channel 6 0: Disabled 1: Enabled |
| 25 | R/W | 0x0 | DMA6_PKG_IRQ_EN Enable the package end interrupt of DMA channel 6 0: Disabled 1: Enabled |

| Offset: 0x0000 | | | Register Name: DMAC_IRQ_EN_REG0 |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 24 | R/W | 0x0 | DMA6_HLAF_IRQ_EN Enable the half package interrupt of DMA channel 6 0: Disabled 1: Enabled |
| 23 | / | / | / |
| 22 | R/W | 0x0 | DMA5_QUEUE_IRQ_EN Enable the queue end interrupt of DMA channel 5 0: Disabled 1: Enabled |
| 21 | R/W | 0x0 | DMA5_PKG_IRQ_EN Enable the package end interrupt of DMA channel 5 0: Disabled 1: Enabled |
| 20 | R/W | 0x0 | DMA5_HLAF_IRQ_EN Enable the half package interrupt of DMA channel 5 0: Disabled 1: Enabled |
| 19 | / | / | / |
| 18 | R/W | 0x0 | DMA4_QUEUE_IRQ_EN Enable the queue end interrupt of DMA channel 4 0: Disabled 1: Enabled |
| 17 | R/W | 0x0 | DMA4_PKG_IRQ_EN Enable the package end interrupt of DMA channel 4 0: Disabled 1: Enabled |
| 16 | R/W | 0x0 | DMA4_HLAF_IRQ_EN Enable the half package interrupt of DMA channel 4 0: Disabled 1: Enabled |
| 15 | / | / | / |
| 14 | R/W | 0x0 | DMA3_QUEUE_IRQ_EN Enable the queue end interrupt of DMA channel 3 0: Disabled 1: Enabled |

| Offset: 0x0000 | | | Register Name: DMAC_IRQ_EN_REG0 |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 13 | R/W | 0x0 | DMA3_PKG_IRQ_EN Enable the package end interrupt of DMA channel 3 0: Disabled 1: Enabled |
| 12 | R/W | 0x0 | DMA3_HLAF_IRQ_EN Enable the half package interrupt of DMA channel 3 0: Disabled 1: Enabled |
| 11 | / | / | / |
| 10 | R/W | 0x0 | DMA2_QUEUE_IRQ_EN Enable the queue end interrupt of DMA channel 2 0: Disabled 1: Enabled |
| 9 | R/W | 0x0 | DMA2_PKG_IRQ_EN Enable the package end interrupt of DMA channel 2 0: Disabled 1: Enabled |
| 8 | R/W | 0x0 | DMA2_HLAF_IRQ_EN Enable the half package interrupt of DMA channel 2 0: Disabled 1: Enabled |
| 7 | / | / | / |
| 6 | R/W | 0x0 | DMA1_QUEUE_IRQ_EN Enable the queue end interrupt of DMA channel 1 0: Disabled 1: Enabled |
| 5 | R/W | 0x0 | DMA1_PKG_IRQ_EN Enable the package end interrupt of DMA channel 1 0: Disabled 1: Enabled |
| 4 | R/W | 0x0 | DMA1_HLAF_IRQ_EN Enable the half package interrupt of DMA channel 1 0: Disabled 1: Enabled |
| 3 | / | / | / |

| Offset: 0x0000 | | | Register Name: DMAC_IRQ_EN_REG0 |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 2 | R/W | 0x0 | DMA0_QUEUE_IRQ_EN Enable the queue end interrupt of DMA channel 0 0: Disabled 1: Enabled |
| 1 | R/W | 0x0 | DMA0_PKG_IRQ_EN Enable the package end interrupt of DMA channel 0 0: Disabled 1: Enabled |
| 0 | R/W | 0x0 | DMA0_HLAF_IRQ_EN Enable the half package interrupt of DMA channel 0 0: Disabled 1: Enabled |

3.9.6.2 0x0004 DMAC IRQ Enable Register1 (Default Value: 0x0000_0000)

| Offset: 0x0004 | | | Register Name: DMAC_IRQ_EN_REG1 |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31 | / | / | / |
| 30 | R/W | 0x0 | DMA15_QUEUE_IRQ_EN Enable the queue end interrupt of DMA channel 15 0: Disabled 1: Enabled |
| 29 | R/W | 0x0 | DMA15_PKG_IRQ_EN Enable the package end interrupt of DMA channel 15 0: Disabled 1: Enabled |
| 28 | R/W | 0x0 | DMA15_HALF_IRQ_EN Enable the half package interrupt of DMA channel 15 0: Disabled 1: Enabled |
| 27 | / | / | / |
| 26 | R/W | 0x0 | DMA14_QUEUE_IRQ_EN Enable the queue end interrupt of DMA channel 14 0: Disabled 1: Enabled |

| Offset: 0x0004 | | | Register Name: DMAC_IRQ_EN_REG1 |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 25 | R/W | 0x0 | DMA14_PKG_IRQ_EN Enable the package end interrupt of DMA channel 14 0: Disabled 1: Enabled |
| 24 | R/W | 0x0 | DMA14_HALF_IRQ_EN Enable the half package interrupt of DMA channel 14 0: Disabled 1: Enabled |
| 23 | / | / | / |
| 22 | R/W | 0x0 | DMA13_QUEUE_IRQ_EN Enable the queue end interrupt of DMA channel 13 0: Disabled 1: Enabled |
| 21 | R/W | 0x0 | DMA13_PKG_IRQ_EN Enable the package end interrupt of DMA channel 13 0: Disabled 1: Enabled |
| 20 | R/W | 0x0 | DMA13_HALF_IRQ_EN Enable the half package interrupt of DMA channel 13 0: Disabled 1: Enabled |
| 19 | / | / | / |
| 18 | R/W | 0x0 | DMA12_QUEUE_IRQ_EN Enable the queue end interrupt of DMA channel 12 0: Disabled 1: Enabled |
| 17 | R/W | 0x0 | DMA12_PKG_IRQ_EN Enable the package end interrupt of DMA channel 12 0: Disabled 1: Enabled |
| 16 | R/W | 0x0 | DMA12_HALF_IRQ_EN Enable the half package interrupt of DMA channel 12 0: Disabled 1: Enabled |
| 15 | / | / | / |

| Offset: 0x0004 | | | Register Name: DMAC_IRQ_EN_REG1 |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 14 | R/W | 0x0 | DMA11_QUEUE_IRQ_EN Enable the queue end interrupt of DMA channel 11 0: Disabled 1: Enabled |
| 13 | R/W | 0x0 | DMA11_PKG_IRQ_EN Enable the package end interrupt of DMA channel 11 0: Disabled 1: Enabled |
| 12 | R/W | 0x0 | DMA11_HALF_IRQ_EN Enable the half package interrupt of DMA channel 11 0: Disabled 1: Enabled |
| 11 | / | / | / |
| 10 | R/W | 0x0 | DMA10_QUEUE_IRQ_EN Enable the queue end interrupt of DMA channel 10 0: Disabled 1: Enabled |
| 9 | R/W | 0x0 | DMA10_PKG_IRQ_EN Enable the package end interrupt of DMA channel 10 0: Disabled 1: Enabled |
| 8 | R/W | 0x0 | DMA10_HALF_IRQ_EN Enable the half package interrupt of DMA channel 10 0: Disabled 1: Enabled |
| 7 | / | / | / |
| 6 | R/W | 0x0 | DMA9_QUEUE_IRQ_EN Enable the queue end interrupt of DMA channel 9 0: Disabled 1: Enabled |
| 5 | R/W | 0x0 | DMA9_PKG_IRQ_EN Enable the package end interrupt of DMA channel 9 0: Disabled 1: Enabled |

| Offset: 0x0004 | | | Register Name: DMAC_IRQ_EN_REG1 |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 4 | R/W | 0x0 | DMA9_HALF_IRQ_EN Enable the half package interrupt of DMA channel 9 0: Disabled 1: Enabled |
| 3 | / | / | / |
| 2 | R/W | 0x0 | DMA8_QUEUE_IRQ_EN Enable the queue end interrupt of DMA channel 8 0: Disabled 1: Enabled |
| 1 | R/W | 0x0 | DMA8_PKG_IRQ_EN Enable the package end interrupt of DMA channel 8 0: Disabled 1: Enabled |
| 0 | R/W | 0x0 | DMA8_HALF_IRQ_EN Enable the half package interrupt of DMA channel 8 0: Disabled 1: Enabled |

3.9.6.3 0x0010 DMAC IRQ Pending Status Register 0 (Default Value: 0x0000_0000)

| Offset: 0x0010 | | | Register Name: DMAC_IRQ_PEND_REG0 |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31 | / | / | / |
| 30 | R/W1C | 0x0 | DMA7_QUEUE_IRQ_PEND The IRQ pending bit for the queue end interrupt of the DMA channel 7. Write 1 to clear the pending status. 0: No effect 1: Pending |
| 29 | R/W1C | 0x0 | DMA7_PKG_IRQ_PEND The IRQ pending bit for the package end interrupt of the DMA channel 7. Write 1 to clear the pending status. 0: No effect 1: Pending |

| Offset: 0x0010 | | | Register Name: DMAC_IRQ_PEND_REG0 |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 28 | R/W1C | 0x0 | <p>DMA7_HALF_IRQ_PEND</p> <p>The IRQ pending bit for the half package interrupt of the DMA channel 7. Write 1 to clear the pending status.</p> <p>0: No effect 1: Pending</p> |
| 27 | / | / | / |
| 26 | R/W1C | 0x0 | <p>DMA6_QUEUE_IRQ_PEND</p> <p>The IRQ pending bit for the queue end interrupt of the DMA channel 6. Write 1 to clear the pending status.</p> <p>0: No effect 1: Pending</p> |
| 25 | R/W1C | 0x0 | <p>DMA6_PKG_IRQ_PEND</p> <p>The IRQ pending bit for the package end interrupt of the DMA channel 6. Write 1 to clear the pending status.</p> <p>0: No effect 1: Pending</p> |
| 24 | R/W1C | 0x0 | <p>DMA6_HALF_IRQ_PEND</p> <p>The IRQ pending bit for the half package interrupt of the DMA channel 6. Write 1 to clear the pending status.</p> <p>0: No effect 1: Pending</p> |
| 23 | / | / | / |
| 22 | R/W1C | 0x0 | <p>DMA5_QUEUE_IRQ_PEND</p> <p>The IRQ pending bit for the queue end interrupt of the DMA channel 5. Write 1 to clear the pending status.</p> <p>0: No effect 1: Pending</p> |
| 21 | R/W1C | 0x0 | <p>DMA5_PKG_IRQ_PEND</p> <p>The IRQ pending bit for the package end interrupt of the DMA channel 5. Write 1 to clear the pending status.</p> <p>0: No effect 1: Pending</p> |
| 20 | R/W1C | 0x0 | <p>DMA5_HALF_IRQ_PEND</p> <p>The IRQ pending bit for the half package interrupt of the DMA channel 5. Write 1 to clear the pending status.</p> <p>0: No effect 1: Pending</p> |

| Offset: 0x0010 | | | Register Name: DMAC_IRQ_PEND_REG0 |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 19 | / | / | / |
| 18 | R/W1C | 0x0 | <p>DMA4_QUEUE_IRQ_PEND</p> <p>The IRQ pending bit for the queue end interrupt of the DMA channel 4. Write 1 to clear the pending status.</p> <p>0: No effect 1: Pending</p> |
| 17 | R/W1C | 0x0 | <p>DMA4_PKG_IRQ_PEND</p> <p>The IRQ pending bit for the package end interrupt of the DMA channel 4. Write 1 to clear the pending status.</p> <p>0: No effect 1: Pending</p> |
| 16 | R/W1C | 0x0 | <p>DMA4_HALF_IRQ_PEND</p> <p>The IRQ pending bit for the half package interrupt of the DMA channel 4. Write 1 to clear the pending status.</p> <p>0: No effect 1: Pending</p> |
| 15 | / | / | / |
| 14 | R/W1C | 0x0 | <p>DMA3_QUEUE_IRQ_PEND</p> <p>The IRQ pending bit for the queue end interrupt of the DMA channel 3. Write 1 to clear the pending status.</p> <p>0: No effect 1: Pending</p> |
| 13 | R/W1C | 0x0 | <p>DMA3_PKG_IRQ_PEND</p> <p>The IRQ pending bit for the package end interrupt of the DMA channel 3. Write 1 to clear the pending status.</p> <p>0: No effect 1: Pending</p> |
| 12 | R/W1C | 0x0 | <p>DMA3_HALF_IRQ_PEND</p> <p>The IRQ pending bit for the half package interrupt of the DMA channel 3. Write 1 to clear the pending status.</p> <p>0: No effect 1: Pending</p> |
| 11 | / | / | / |

| Offset: 0x0010 | | | Register Name: DMAC_IRQ_PEND_REG0 |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 10 | R/W1C | 0x0 | <p>DMA2_QUEUE_IRQ_PEND</p> <p>The IRQ pending bit for the queue end interrupt of the DMA channel 2. Write 1 to clear the pending status.</p> <p>0: No effect 1: Pending</p> |
| 9 | R/W1C | 0x0 | <p>DMA2_PKG_IRQ_PEND</p> <p>The IRQ pending bit for the package end interrupt of the DMA channel 2. Write 1 to clear the pending status.</p> <p>0: No effect 1: Pending</p> |
| 8 | R/W1C | 0x0 | <p>DMA2_HALF_IRQ_PEND</p> <p>The IRQ pending bit for the half package interrupt of the DMA channel 2. Write 1 to clear the pending status.</p> <p>0: No effect 1: Pending</p> |
| 7 | / | / | / |
| 6 | R/W1C | 0x0 | <p>DMA1_QUEUE_IRQ_PEND</p> <p>The IRQ pending bit for the queue end interrupt of the DMA channel 1. Write 1 to clear the pending status.</p> <p>0: No effect 1: Pending</p> |
| 5 | R/W1C | 0x0 | <p>DMA1_PKG_IRQ_PEND</p> <p>The IRQ pending bit for the package end interrupt of the DMA channel 1. Write 1 to clear the pending status.</p> <p>0: No effect 1: Pending</p> |
| 4 | R/W1C | 0x0 | <p>DMA1_HALF_IRQ_PEND</p> <p>The IRQ pending bit for the half package interrupt of the DMA channel 1. Write 1 to clear the pending status.</p> <p>0: No effect 1: Pending</p> |
| 3 | / | / | / |
| 2 | R/W1C | 0x0 | <p>DMA0_QUEUE_IRQ_PEND</p> <p>The IRQ pending bit for the queue end interrupt of the DMA channel 0. Write 1 to clear the pending status.</p> <p>0: No effect 1: Pending</p> |

| Offset: 0x0010 | | | Register Name: DMAC_IRQ_PEND_REG0 |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 1 | R/W1C | 0x0 | <p>DMA0_PKG_IRQ_PEND</p> <p>The IRQ pending bit for the package end interrupt of the DMA channel 0. Write 1 to clear the pending status.</p> <p>0: No effect 1: Pending</p> |
| 0 | R/W1C | 0x0 | <p>DMA0_HALF_IRQ_PEND</p> <p>The IRQ pending bit for the half package interrupt of the DMA channel 0. Write 1 to clear the pending status.</p> <p>0: No effect 1: Pending</p> |

3.9.6.4 0x0014 DMAC IRQ Pending Status Register 1 (Default Value: 0x0000_0000)

| Offset: 0x0010 | | | Register Name: DMAC_IRQ_PEND_REG0 |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31 | / | / | / |
| 30 | R/W1C | 0x0 | <p>DMA15_QUEUE_IRQ_PEND</p> <p>The IRQ pending bit for the queue end interrupt of the DMA channel 15. Write 1 to clear the pending status.</p> <p>0: No effect 1: Pending</p> |
| 29 | R/W1C | 0x0 | <p>DMA15_PKG_IRQ_PEND</p> <p>The IRQ pending bit for the package end interrupt of the DMA channel 15. Write 1 to clear the pending status.</p> <p>0: No effect 1: Pending</p> |
| 28 | R/W1C | 0x0 | <p>DMA15_HALF_IRQ_PEND</p> <p>The IRQ pending bit for the half package interrupt of the DMA channel 15. Write 1 to clear the pending status.</p> <p>0: No effect 1: Pending</p> |
| 27 | / | / | / |

| Offset: 0x0010 | | | Register Name: DMAC_IRQ_PEND_REG0 |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 26 | R/W1C | 0x0 | <p>DMA14_QUEUE_IRQ_PEND</p> <p>The IRQ pending bit for the queue end interrupt of the DMA channel 14. Write 1 to clear the pending status.</p> <p>0: No effect 1: Pending</p> |

3.9.6.5 0x0028 DMAC Auto Gating Register (Default Value: 0x0000_0000)

| Offset: 0x0028 | | | Register Name: DMAC_AUTO_GATE_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:3 | / | / | / |
| 2 | R/W | 0x0 | DMA_MCLK_CIRCUIT Auto gating bit of DMA MCLK interface circuit 0: Auto gating enabled 1: Auto gating disabled |
| 1 | R/W | 0x0 | DMA_COMMON_CIRCUIT Auto gating bit of DMA common circuit 0: Auto gating enabled 1: Auto gating disabled |
| 0 | R/W | 0x0 | DMA_CHAN_CIRCUIT Auto gating bit of DMA channel circuit 0: Auto gating enabled 1: Auto gating disabled |

 **NOTE**

When initializing the DMA Controller, the bit[2] should be set up.

3.9.6.6 0x0030 DMAC Status Register (Default Value: 0x0000_0000)

| Offset: 0x0030 | | | Register Name: DMAC_STA_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R | 0x0 | MBUS FIFO Status 0: Empty 1: Not Empty |
| 30:16 | / | / | / |

| Offset: 0x0030 | | | Register Name: DMAC_STA_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 15:0 | R | 0x0 | DMA_STATUS DMA Channel[15:0] Status The meaning of each bit: 0: Idle 1: Busy |

3.9.6.7 0x0100 + N*0x0040 DMAC Channel Enable Register N (Default Value: 0x0000_0000)

| Offset: 0x0100 + N*0x0040 (N = 0 to 15) | | | Register Name: DMAC_EN_REGN |
|--|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:1 | / | / | / |
| 0 | R/W | 0x0 | DMA_EN DMA Channel Enable 0: Disabled 1: Enabled |

3.9.6.8 0x0104 + N*0x0040 DMAC Channel Pause Register N (Default Value: 0x0000_0000)

| Offset: 0x0104 + N*0x0040 (N = 0 to 15) | | | Register Name: DMAC_PAU_REGN |
|--|------------|-------------|---|

3.9.6.17 0x0130 + N*0x0040 DMAC Package Number Register N (Default Value: 0x0000_0000)

| Offset: 0x0130 + N*0x0040 (N = 0 to 15) | | | Register Name: DMAC_PKG_NUM_REGN |
|--|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | DMA_PKG_NUM This register records the number of packages which has been completed in one transmission. |

3.10.3.2 Timing Requirements

The following figure shows the timing requirements for the THS.

Figure 3-25 Thermal Sensor Timing Requirement

CLK_IN = 24 MHz

CONV_TIME (Conversion Time) = $1/24 \text{ MHz} \times 14 \text{ Cycles} = 0.583 \text{ us}$

TACQ > $1/24 \text{ MHz} \times 24 \text{ Cycles}$

THERMAL_PER > ADC_Sample_Frequency > TACQ + CONV_TIME

3.10.3.3 Interrupts

The THS has four interrupt sources: DATA_IRQ, SHUTDOWN_IRQ, ALARM_IRQ, and ALARM_OFF_IRQ. The following figure shows thermal sensor interrupt sources.

Figure 3-26 Thermal Sensor Controller Interrupt Source

DATA_IRQ: The interrupt is generated when the measured sensor_data is updated.

SHUTDOWN_IRQ: The interrupt is generated when the temperature is higher than the shutdown threshold.

ALARM_IRQ: The interrupt is generated when the temperature is higher than the Alarm_Threshold.

ALARM_OFF_IRQ: The interrupt is generated when the temperature drops to lower than the Alarm_Off_Threshold. It is triggered at the fall edge.

3.10.3.4 THS Temperature Conversion Formula

$$T = (\text{sensor_data} - 2794) / (-14.882)$$

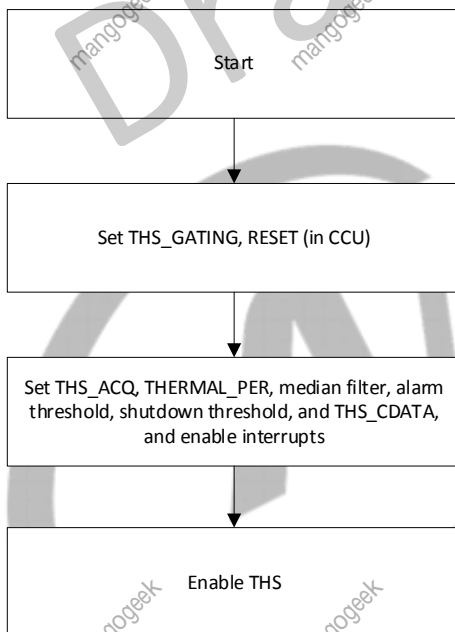

Unit of T: Celsius degree (°C).

The sensor_data is read from the sensor data register.

3.10.4 Programming Guidelines

The initial process of the THS is as follows.

Figure 3-27 THS Initial Process

In the final test (FT) stage, the THS is calibrated through the ambient temperature, and the calibration value is written in the SID module. The following table shows the THS information in the SID.

Table 3-14 THS Information in the SID

| Base Address: 0x14 | Register Name: THS |
|--------------------|--|
| Bit | Description |
| 27:16 | The calibration value of the T-sensor. |

Before enabling THS, read eFuse value and write the value to [THS_CDATA](#).

Query Mode

- Step 1** Write 0x1 to the bit[16] of [THS_BGR_REG](#) to dessert the reset.
- Step 2** Write 0x1 to the bit[0] of [THS_BGR_REG](#) to open the THS clock.
- Step 3** Write 0x2F to the bit[15:0] of [THS_CTRL](#) to set the ADC acquire time.
- Step 4** Write 0x1DF to the bit[31:16] of [THS_CTRL](#) to set the ADC sample frequency divider.
- Step 5** Write 0x3A to the bit[31:12] of [THS_PER](#) to set the THS work period.
- Step 6** Write 0x1 to the bit[2] of [THS_FILTER](#) to enable the temperature convert filter.
- Step 7** Write 0x1 to the bit[1:0] of [THS_FILTER](#) to select the filter type.
- Step 8** Read THS eFuse value from SID, then write the eFuse value to [THS_CDATA](#) to calibrate THS.
- Step 9** Write 0x1 to the bit[0] of [THS0_EN](#) to enable THS.
- Step 10** Read the bit[0] of [THS_DATA_INTS](#). If it is 1, the temperature conversion is complete.
- Step 11** Read the bit[11:0] of [THS_DATA](#), and calculate the THS temperature based on section 3.10.3.4 "[THS Temperature Conversion Formula](#)".

Interrupt Mode

- Step 1** Write 0x1 to the bit16 of [THS_BGR_REG](#) to dessert the reset.
- Step 2** Write 0x1 to the bit0 of [THS_BGR_REG](#) to open the THS clock.
- Step 3** Write 0x2F to the bit[15:0] of [THS_CTRL](#) to set the ADC acquire time.
- Step 4** Write 0x1DF to the bit[31:16] of [THS_CTRL](#) to set the ADC sample frequency divider.
- Step 5** Write 0x3A to the bit[31:12] of [THS_PER](#) to set the THS work period.
- Step 6** Write 0x1 to the bit2 of [THS_FILTER](#) to enable the temperature convert filter.
- Step 7** Write 0x1 to the bit[1:0] of [THS_FILTER](#) to select the filter type.
- Step 8** Read THS eFuse value from SID, and then write the eFuse value to [THS_CDATA](#) to calibrate THS.
- Step 9** Write 0x1 to the bit[0] of [THS_DATA_INTC](#) to enable the interrupt of THS.
- Step 10** Set interrupt interface.
- Step 11** Put the interrupt handler address into the interrupt vector table.
- Step 12** Write 0x1 to the bit[0] of [THS0_EN](#) to enable THS.
- Step 13** Read the bit[0] of [THS_DATA_INTS](#). If it is 1, the temperature conversion is complete.
- Step 14** Read the bit[11:0] of [THS_DATA](#), and calculate the THS temperature based on section 3.10.3.4 "[THS Temperature Conversion Formula](#)".

3.10.5 Register List

| Module Name | Base Address |
|-------------|--------------|
| THS | 0x02009400 |

| Register Name | Offset | Description |
|-------------------|--------|---|
| THS_CTRL | 0x0000 | THS Control Register |
| THS_EN | 0x0004 | THS Enable Register |
| THS_PER | 0x0008 | THS Period Control Register |
| THS_DATA_INTC | 0x0010 | THS Data Interrupt Control Register |
| THS_SHUT_INTC | 0x0014 | THS Shut Interrupt Control Register |
| THS_ALARM_INTC | 0x0018 | THS Alarm Interrupt Control Register |
| THS_DATA_INTS | 0x0020 | THS Data Interrupt Status Register |
| THS_SHUT_INTS | 0x0024 | THS Shut Interrupt Status Register |
| THS_ALARM0_INTS | 0x0028 | THS Alarm off Interrupt Status Register |
| THS_ALARM_INTS | 0x002C | THS Alarm Interrupt Status Register |
| THS_FILTER | 0x0030 | THS Median Filter Control Register |
| THS_ALARM_CTRL | 0x0040 | THS Alarm Threshold Control Register |
| THS_SHUTDOWN_CTRL | 0x0080 | THS Shutdown Threshold Control Register |
| THS_CDATA | 0x00A0 | THS Calibration Data |
| THS_DATA | 0x00C0 | THS Data Register |

3.10.6 Register Description

3.10.6.1 0x0000 THS Control Register (Default Value: 0x01DF_002F)

| Offset: 0x0000 | | | Register Name: THS_CTRL |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | R/W | 0x1DF | TACQ ADC acquire time CLK_IN/(n + 1) The default value is 2 us. |
| 15:0 | R/W | 0x2F | Reserved |

3.10.6.2 0x0004 THS Enable Register (Default Value: 0x0000_0000)

| Offset: 0x0004 | | | Register Name: THS_EN |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:1 | / | / | / |
| 0 | R/W | 0x0 | THS_EN Enable temperature measurement sensor 0: Disable 1: Enable |

3.10.6.3 0x0008 THS Period Control Register (Default Value: 0x0003_A000)

| Offset: 0x0008 | | | Register Name: THS_PER |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:12 | R/W | 0x3A | THERMAL_PER Temperature measurement period $4096 * (n + 1) / \text{CLK_IN}$ The default value is 10 ms. |
| 11:0 | / | / | / |

3.10.6.4 0x0010 THS Data Interrupt Control Register (Default Value: 0x0000_0000)

| Offset: 0x0010 | | | Register Name: THS_DATA_INTC |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:1 | / | / | / |
| 0 | R/W | 0x0 | THS_DATA_IRQ_EN Enable the interrupt of sensor_data update If enabled, when the measured sensor_data is updated, it will generate an interrupt. 0: Disabled 1: Enabled |

3.10.6.5 0x0014 THS Shut Interrupt Control Register (Default Value: 0x0000_0000)

| Offset: 0x0014 | | | Register Name: THS_SHUT_INTC |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:1 | / | / | / |
| 0 | R/W | 0x0 | SHUT_INT_EN Enable the shutdown interrupt for the sensor 0: Disabled 1: Enabled |

3.10.6.6 0x0018 THS Alarm Interrupt Control Register (Default Value: 0x0000_0000)

| Offset: 0x0018 | | | Register Name: THS_ALARM_INTC |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:1 | / | / | / |
| 0 | R/W | 0x0 | ALARM_INT_EN Enable the alarm interrupt for the sensor 0: Disabled 1: Enabled |

3.10.6.7 0x0020 THS Data Interrupt Status Register (Default Value: 0x0000_0000)

| Offset: 0x0020 | | | Register Name: THS_DATA_INTS |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:1 | / | / | / |
| 0 | R/W1C | 0x0 | THS_DATA_IRQ_STS Indicates the pending status of the sensor's data interrupt. Write 1 to clear the pending status. 0: No effect 1: Pending |

3.10.6.8 0x0024 THS Shut Interrupt Status Register (Default Value: 0x0000_0000)

| Offset: 0x0024 | | | Register Name: THS_SHUT_INTS |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:1 | / | / | / |
| 0 | R/W1C | 0x0 | SHUT_INT_STS Indicates the pending status of the sensor's shutdown interrupt. Write 1 to clear the pending status. 0: No effect 1: Pending |

3.10.6.9 0x0028 THS Alarm Off Interrupt Status Register (Default Value: 0x0000_0000)

| Offset: 0x0028 | | | Register Name: THS_ALARM_INTS |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:1 | / | / | / |
| 0 | R/W1C | 0x0 | ALARM_OFF_STS Alarm interrupt off pending for sensor Write 1 to clear the pending status. 0: No effect 1: Pending |

3.10.6.10 0x002C THS Alarm Interrupt Status Register (Default Value: 0x0000_0000)

| Offset: 0x002C | | | Register Name: THS_ALARM_INTS |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:1 | / | / | / |
| 0 | R/W1C | 0x0 | ALARM_INT_STS Alarm interrupt pending for sensor Write 1 to clear the pending status. 0: No effect 1: Pending |

3.10.6.11 0x0030 Median Filter Control Register (Default Value: 0x0000_0001)

| Offset: 0x0030 | | | Register Name: THS_FILTER |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:3 | / | / | / |
| 2 | R/W | 0x0 | FILTER_EN Filter enable 0: Disabled 1: Enabled |
| 1:0 | R/W | 0x1 | FILTER_TYPE Averaging filter type 00: 2 01: 4 10: 8 11: 16 |

3.10.6.12 0x0040 THS Alarm Threshold Control Register (Default Value: 0x05A0_0684)

| Offset: 0x0040 | | | Register Name: THS_ALARM_CTRL |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:28 | / | / | / |
| 27:16 | R/W | 0x5A0 | ALARM_T_HOT Thermal sensor alarm threshold for hot temperature |
| 15:12 | / | / | / |
| 11:0 | R/W | 0x684 | ALARM_T_HYST Thermal sensor alarm threshold for hysteresis temperature |

3.10.6.13 0x0080 THS Shutdown Threshold Control Register (Default Value: 0x0000_04E9)

| Offset: 0x0080 | | | Register Name: THS_SHUTDOWN_CTRL |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:28 | / | / | / |
| 11:0 | R/W | 0x4E9 | SHUT_T_HOT Thermal sensor shutdown threshold for hot temperature |

3.10.6.14 0x00A0 THS Calibration Data Register (Default Value: 0x0000_0800)

| Offset: 0x00A0 | | | Register Name: THS_CDATA |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:12 | / | / | / |
| 11:0 | R/W | 0x800 | THS_CDATA Thermal sensor calibration data |

3.10.6.15 0x00C0 THS Data Register (Default Value: 0x0000_0000)

| Offset: 0x00C0 | | | Register Name: THS_DATA |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:12 | / | / | / |
| 11:0 | R | 0x0 | THS_DATA Temperature measurement data of sensor |

3.11 IOMMU

3.11.1 Overview

The I/O Memory management unit (IOMMU) is designed for product specific memory requirements. It maps the virtual address (sent by peripheral access memory) to the physical address. The IOMMU allows multiple ways to manage the location of physical address, and it can use physical address which has potentially conflict mapping for different processes to allocate memory space, and also allow application of non-continuous address mapping to continuous virtual address space.

Features:

- Supports virtual address to physical address mapping by hardware implementation
- Supports VE, CSI, DE, G2D, DI parallel address mapping
- Supports VE, CSI, DE, G2D, DI bypass function independently
- Supports VE, CSI, DE, G2D, DI prefetch independently
- Supports VE, CSI, DE, G2D, DI interrupt handing mechanism independently
- Supports 2 levels TLB (level1 TLB for special using, and level2 TLB for sharing)
- Supports TLB Fully cleared and Partially disabled
- Supports trigger PTW behavior when TLB miss
- Supports checking the permission

3.11.2 Block Diagram

The internal module of IOMMU mainly has the following parts.

Micro TLB: level1 TLB, 64 words. Each peripheral corresponds to a TLB, which caching the level2 page table for the peripheral.

Macro TLB: level2 TLB, 4K words. Each peripheral shares a level2 TLB for caching the level2 page table.

Prefetch Logic: Each Micro TLB corresponds to a Prefetch Logic. By monitoring each master device to predict the bus access, the secondary page table corresponding to the address to be accessed can be read from memory and stored in the secondary TLB to improve hit ratio.

PTW Logic: Page Table Walk, mainly contains PTW Cache and PTW. The PTW Cache is used to store the level1 page table; when the virtual address VA missed in the level1 and level2 TLB, it will trigger the PTW. PTW Cache can store 512 level1 page tables, that is, 512 words.

PMU: Performance Monitoring Unit, which is used to count hit efficiency and latency.

APB Interface: IOMMU register instantiation module. CPU reads and writes the IOMMU register by APB bus.

Figure 3-28 shows the internal block diagram of IOMMU.

Figure 3-28 IOMMU Block Diagram

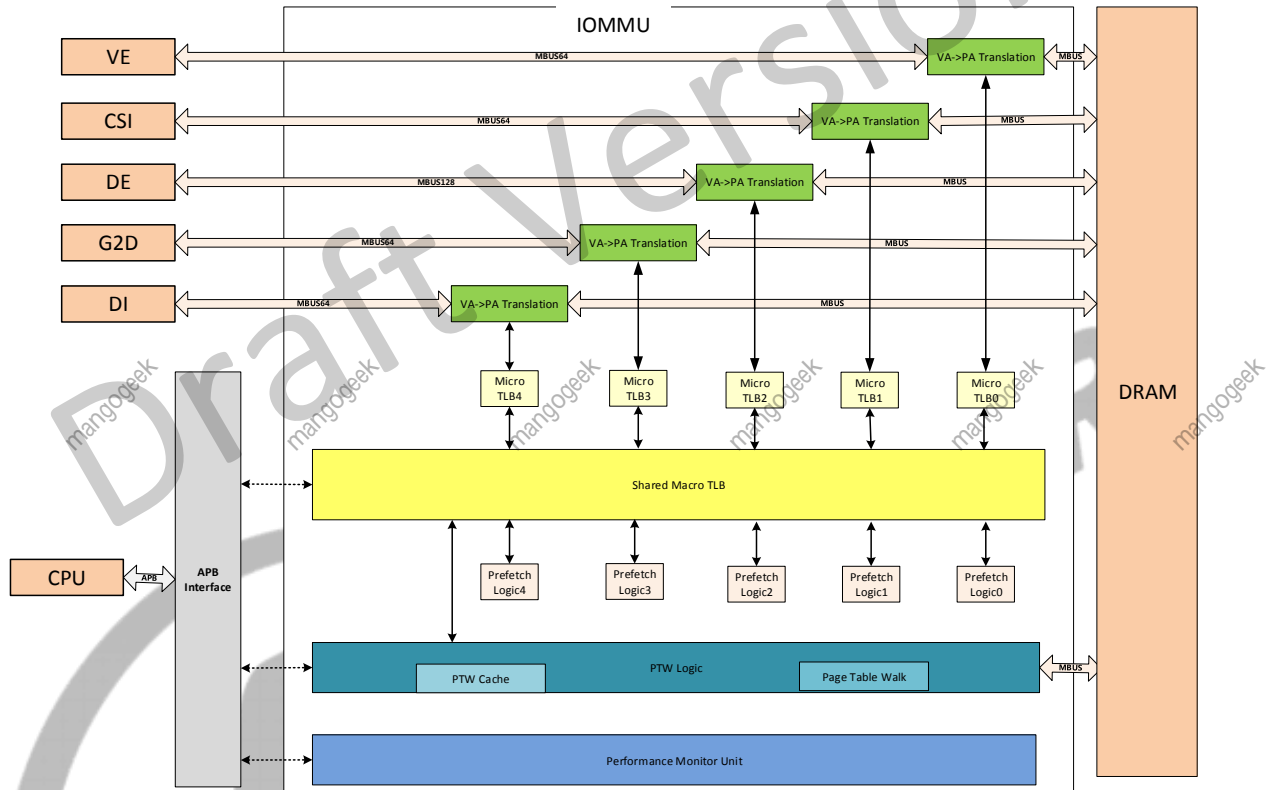

Table 3-15 Correspondence Relation between Master and Module

| Master Number | Module |
|---------------|--------|
| Master0 | VE |
| Master1 | CSI |
| Master2 | DE |
| Master3 | G2D |
| Master4 | DI |

3.1.1.3 Functional Description

3.1.1.3.1 Initialization

- Release the IOMMU reset signal by writing 1 to the bit[31] of the **IOMMU Reset Register**;

- Write the base address of the first TLB to the **IOMMU Translation Table Base Register**;
- Set the **IOMMU Interrupt Enable Register**;
- Enable the IOMMU by configuring the **IOMMU Enable Register** in the final.

3.11.3.2 Address Changing

In the process of address mapping, The peripheral virtual address VA[31:12] are retrieved in the Level1 TLB, when TLB hits, the mapping finished, or they are retrieved in the Level2 TLB in the same way. If TLB hits, it will write the hit mapping to the Level1 TLB, and hits in Level1 TLB. If Level1 and Level2 TLB are retrieved fail, it will trigger the PTW. After opening peripheral bypass function by setting IOMMU Bypass Register, IOMMU will not map the address for peripheral typed the address, and it will output the virtual address as physical address. The typical scenarios are as follows.

Micro TLB hit

- Step 1** The master device sends a transfer command to send the address to the corresponding Micro TLB, and searches the Level2 page table corresponding to virtual address;
- Step 2** If Micro TLB hits, it will return a corresponding physical addresses and the Level2 page table of permission Index;
- Step 3** Address transform module converts the virtual address into physical address, and checks the permissions at the same time. If pass, the transfer is completed.

Micro TLB miss, Macro TLB hit

- Step 1** The master device sends a transfer command to send the address to the corresponding Micro TLB, and searches the Level2 page table corresponding to virtual address;
- Step 2** If Micro TLB misses, then continue to search Macro TLB;
- Step 3** If Macro TLB hits, it will return the Level2 page table to Micro TLB;
- Step 4** Micro TLB receives the page table and puts it to Micro TLB (if this Micro TLB is full, there will happen the replace activity), at the same time, the page table entry is sent to address translation module;
- Step 5** Address transform module converts the virtual address into physical address, and checks the permissions at the same time. If pass, the transfer is completed.

Micro TLB miss, Macro TLB miss, PTW Cache hit

- Step 1** The master device sends a transfer command to send the address to the corresponding Micro TLB, and searches the Level2 page table corresponding to virtual address;
- Step 2** If Micro TLB misses, then continue to search Macro TLB;
- Step 3** If Macro TLB misses, then it will send the request to the PTW to return the corresponding page table;
- Step 4** PTW first accesses PTW Cache, confirms that the required Level1 page table exists in the PTW Cache, sends the page table to PTW logic;
- Step 5** PTW logic returns the corresponding Level2 page table from memory page table according to Level1 page table, checks the effectiveness, and sends to Macro TLB;
- Step 6** Macro TLB stores the Level2 page table (there may happen the replace activity), and will return the Level2 page table to Micro TLB;
- Step 7** Micro TLB receives the page table entries and puts it to the Micro TLB (if this Micro TLB is full, there will happen the replace activity), and sends page table entries to address translation module;
- Step 8** Address transform module converts the virtual address into physical address, and checks the permissions at the same time. If pass, the transfer is completed.

Micro TLB miss, Macro TLB miss, PTW Cache miss

- Step 1** The master device sends a transfer command to send the address to the corresponding Micro TLB, and searches the Level2 page table corresponding to virtual address;
- Step 2** If Micro TLB misses, then continue to search Macro TLB;
- Step 3** If Macro TLB misses, there will send the request to the PTW to return the corresponding page table;
- Step 4** PTW accesses PTW Cache, the Level1 page table is unnecessary;
- Step 5** PTW accesses memory to get the corresponding Level1 page table and stores it to the PTW Cache (there may happen the replace activity);
- Step 6** PTW logic returns the corresponding Level2 page table from memory page table according to Level1 page table, checks the effectiveness, and sends to Macro TLB;
- Step 7** Macro TLB stores the Level2 page table (there may happen the replace activity), and returns the Level 2 page table to Micro TLB;
- Step 8** Micro TLB receives the page table entries and puts it to the Micro TLB (if this Micro TLB is full, there will happen the replace activity), and sends page table entries to address translation module;
- Step 9** Address transform module converts the virtual address into physical address, and checks the permissions at the same time. If pass, the transfer is completed.

Permission error

- Step 1** Permission checking always performs in the address conversion;
- Step 2** Once the permission checking makes mistake, the new access of the master suspends, but continues before this access;
- Step 3** Set the error status register;
- Step 4** Trigger interrupt.

Invalid Level1 page table

- Step 1** Invalid Level1 page table is checked when PTW logic reads the new level page table from memory;
- Step 2** The PTW reads sequentially two page table entries from the memory (64-bit data, a complete cache line), and stores in the PTW cache;
- Step 3** If the current page table is detected invalid, then the error flag is set, and the interrupt is triggered, the cache line need to be invalidated.

NOTE

- Invalid page table has two situations: the reading target page table from the memory is invalid; and the page table stored in PTW Cache with target page table is found to be invalid after using;
- If a page table is invalid, then the total cache line (that is two page tables) need to be invalidated.

Invalid Level2 page table

- Step 1** Invalid Level2 page table checks when Macro TLB reads the new level page table from memory;
- Step 2** The Macro TLB reads sequentially two page table entries from the memory (64-bit data, a complete cache line), and stores in the Macro TLB;
- Step 3** If the current page table is detected invalid, then the error flag is set, and the interrupt is triggered, the cache line need to be invalidated.

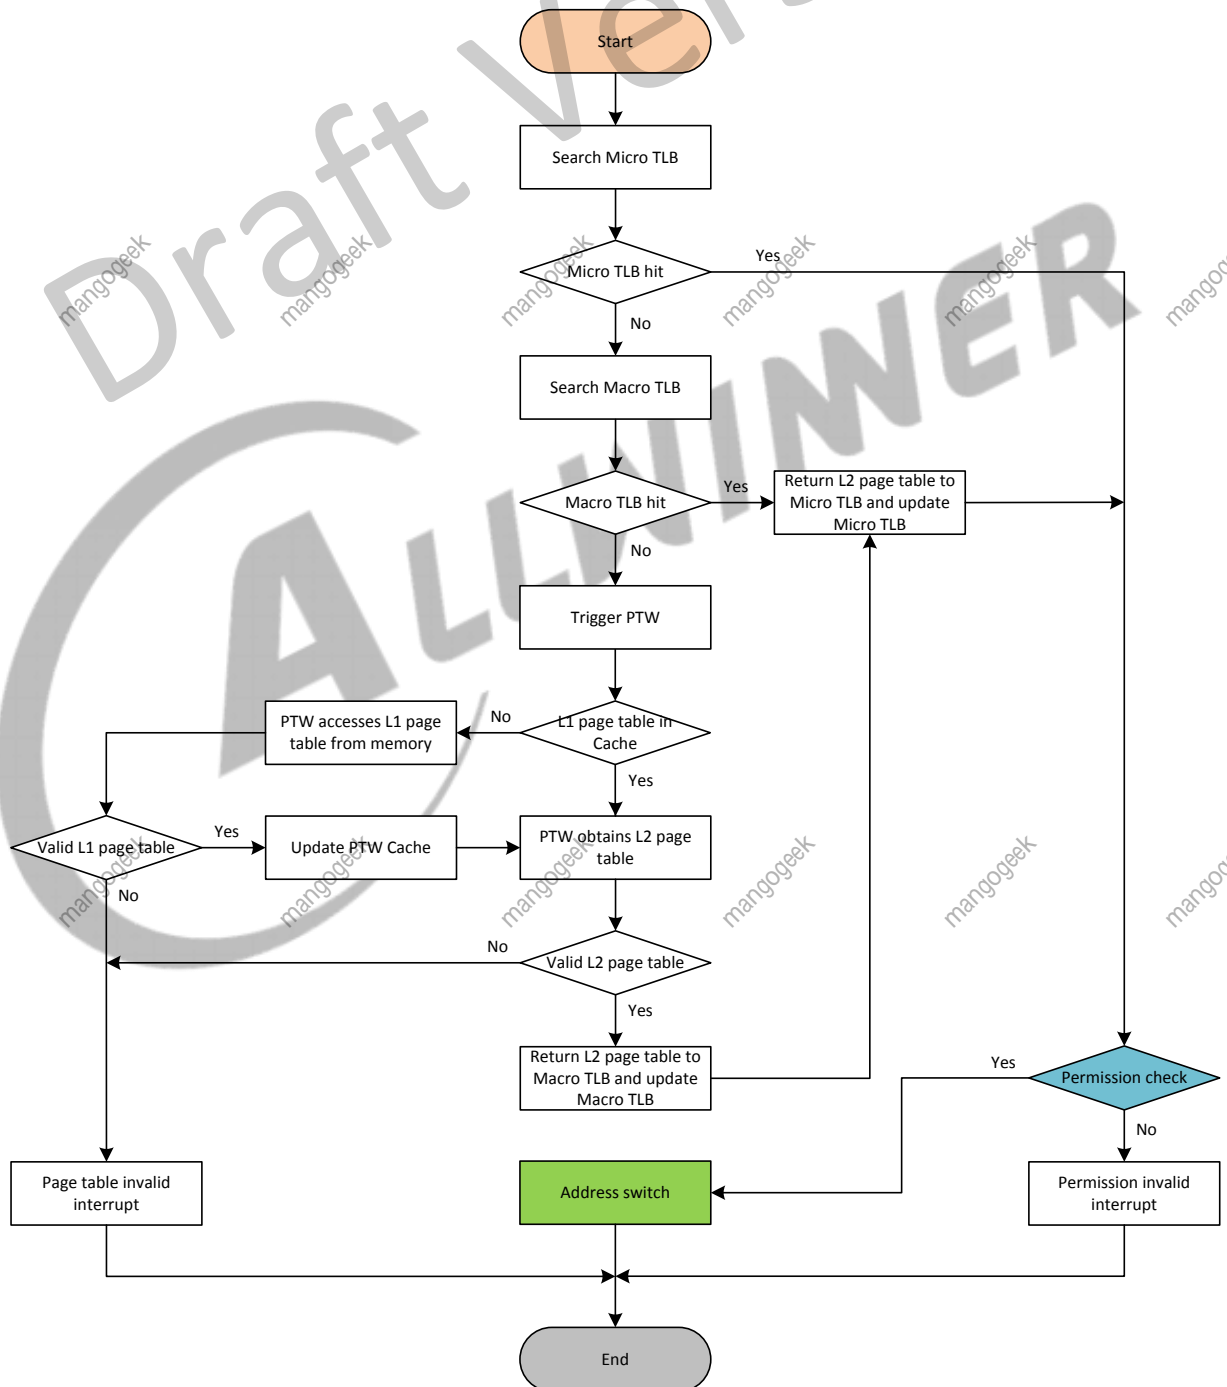

NOTE

- Invalid page table has two situations: the reading target page table from the memory is invalid; and the page table stored in Macro TLB with target page table is found to be invalid after using.
- If a page table is invalid, then the total cache line (that is two page tables) need to be invalidated.

The internal address switch process shows in Figure 3-29.

Figure 3-29 Internal Switch Process

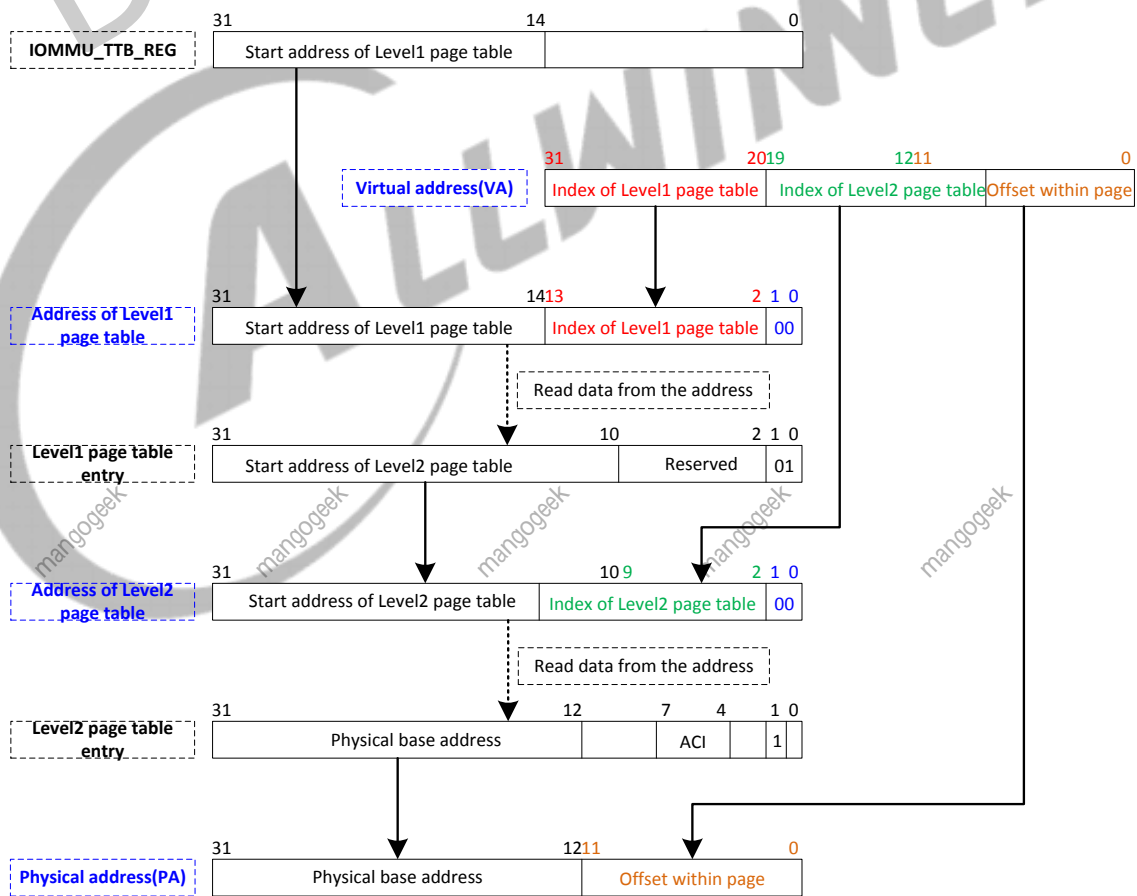

3.11.3.3 VA-PA Mapping

IOMMU page table is defined as Level2 mapping, the first level is 1M address space mapping, the second level is 4K address space. This version does not support 1K, 16K and other page table size. IOMMU supports a page table only, its meaning is:

- All peripherals connected to IOMMU use the same virtual address space;
- The virtual address space of the peripherals can overlap;
- Different virtual addresses can map to the same physical address space;

Base address of the page table is defined by software, and it needs 16 KB address alignment; Page table of the Level2 table item needs 1 KB address alignment. Figure 3-30 shows a complete VA-PA address translation process.

Figure 3-30 VA-PA Switch Process

3.11.3.4 Clear and Invalidate TLB

When the content of multi page tables refreshes or the address of page table changes, all VA-PA mapping which has been cached in TLB will no longer be valid, then you need configure **IOMMU TLB Flush Enable Register** to clear the TLB or PTW Cache. First suspend the access to TLB or Cache, then configure the corresponding Flush bit of **IOMMU TLB Flush Enable Register**, after the operation takes effect, the related peripherals can continue to send new access memory operations.

When some page table is invalid or incorrect mapping, you can set the TLB Invalidation relevant register to invalidate some TLB VA-PA mapping pairs. There are two modes to invalidate the TLB operation.

(1) Mode0 (Old mode)

Step 1 Set **IOMMU TLB Invalidation Mode Select Register** to 0 to select mode0;

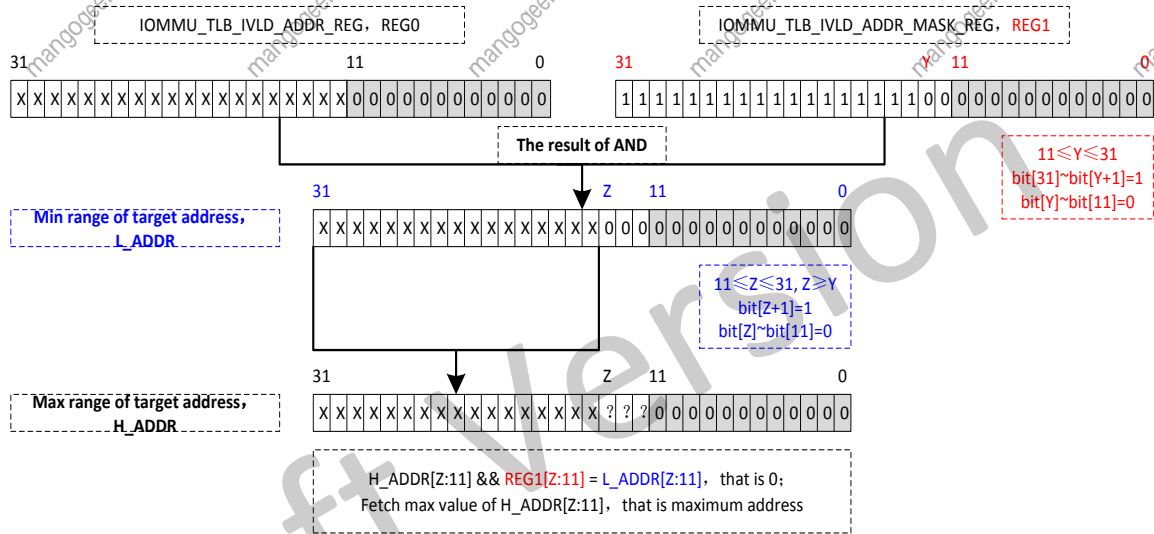

Step 2 Write target address to **IOMMU TLB Invalidation Address Register**;

Step 3 Set configuration values to **IOMMU TLB Invalidation Address Mask Register**, the requirements are as follows:

- The value of **IOMMU TLB Invalidation Address Mask Register** cannot be less than the **IOMMU TLB Invalidation Address Register**.
- The higher bit of **IOMMU TLB Invalidation Address Mask Register** must be continuous 1, the lower bit must be continuous 0. For example, 0xffff000, 0xffffe000, 0xffffc000, 0xffff8000, 0xffff0000 belongs to the legal value; and 0xffffd000, 0xffffb000, 0xffffa000, 0xffff9000, 0xffff7000 belongs to the illegal values.

Step 4 Configure **IOMMU TLB Invalidation Enable Register** to enable the invalid operation. Among the way to determine the invalid address is to get maximum valid bit and determine target address range by target address AND mask address. Figure 3-30 shows the process.

Figure 3-31 Invalid TLB Address Range

For example:

- When the value of **IOMMU TLB Invalidation Address Mask Register** is `0xFFFF000` by default, the result of AND is target address, that is, only target address is invalid.
- When the value of **IOMMU TLB Invalidation Address Mask Register** is `0xFFFF0000`, the value of **IOMMU TLB Invalidation Address Register** is `0xE0000000`, then the range of target address is from `0xE0000000` to `0xE0000000`.
- When the value of **IOMMU TLB Invalidation Address Mask Register** is `0xFFFFC000`, the value of **IOMMU TLB Invalidation Address Register** is `0xE0000000`, then the range of target address is from `0xE0000000` to `0xE0000000`.
- When the value of **IOMMU TLB Invalidation Address Mask Register** is `0xFFFF8000`, the value of **IOMMU TLB Invalidation Address Register** is `0xE0000000`, then the range of target address is from `0xE0000000` to `0xE0000000`.
- When the value of **IOMMU TLB Invalidation Address Mask Register** is `0xFFFFC000`, the value of **IOMMU TLB Invalidation Address Register** is `0xE0000000`, then the range of target address is from `0xE0000000` to `0xE0000000`.

(2) Mode1 (New mode)

- Step 1** Set **IOMMU TLB Invalidation Mode Select Register** to 1 to select mode1;
- Step 2** Set the starting address of invalid TLB by **IOMMU TLB Invalidation Start Address Register**, and set the ending address of invalid TLB by **IOMMU TLB Invalidation Start Address Register**;
- Step 3** Configure **IOMMU TLB Invalidation Enable Register** to enable invalid operation, then the related TLB operation is invalidated.

3.11.3.5 Clear and Invalidate PTW Cache

There are two modes to invalidate the PTW cache operation.

(1) Mode0 (Old mode)

- Step 1** Set **IOMMU PC Invalidation Mode Select Register** to 0 to select mode0;
- Step 2** Set the address register that needs to be invalidated to **IOMMU PC Invalidation Address Register** (the addresses need to be aligned with 1 MB);
- Step 3** Configure **IOMMU PC Invalidation Enable Register** to enable the invalid operation. That is, the PTW cache operation of a cacheline is invalidated.

(2) Mode1 (New mode)

- Step 1** Set **IOMMU PC Invalidation Mode Select Register** to 1 to select mode1;
- Step 2** Set the starting address of invalid TLB by **IOMMU PTW Invalidation Start Address Register**, and set the ending address of invalid TLB by **IOMMU PC Invalidation Start Address Register**;
- Step 3** Configure **IOMMU PC Invalidation Enable Register** to enable invalid operation, then to invalidate the related PWM cache operation is completed.

3.11.3.6 Page Table Format

Level1 Page Table

The format of Level1 page table is as follows.

Figure 3-32 Level1 Page Table Format

| | | |
|------------------------------------|----------|-------|
| 31 | 10 9 | 2 1 0 |
| Start address of Level2 page table | Reserved | 01 |

Bit[31:10]: Base address of Level2 page table;

Bit[9:2]: Reserved;

Bit[1:0]: 01 is valid page table; others are fault;

Level2 Page Table

The format of Level2 page table is as follows.

Figure 3-33 Level1 Page Table Format

| | | | | | |
|-----------------------|----|-----|---|---|---|
| 31 | 12 | 7 | 4 | 1 | 0 |
| Physical base address | | ACI | | | |

Bit[31:12]: Physical address of 4K address;

Bit[11:8]: Reserved;

Bit[7:4]: ACI, permission control index; correspond to permission control bit of **IOMMU Domain Authority Control Register**;

Bit[3:2]: Reserved;

Bit[1]: 1 is valid page table; 0 is fault;

Bit[0]: Reserved

Permission Index

The read/write access control of series register such as **IOMMU Domain Authority Control Register** is as follows.

Figure 3-34 Read/Write Permission Control

| | | | | | | | | | | | | | |
|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| W | R | W | R | W | R | W | R | W | R | W | R | W | R |

Bit[1:0]/Bit[17:16]: Master0 read/write permission control;

Bit[3:2]/Bit[19:18]: Master1 read/write permission control;

Bit[5:4]/Bit[21:20]: Master2 read/write permission control;

Bit[7:6]/Bit[23:22]: Master3 read/write permission control;

Bit[9:8]/Bit[25:24]: Master4 read/write permission control;

Bit[11:10]/Bit[27:26]: Master5 read/write permission control;

Bit[13:12]/Bit[29:28]: Master6 read/write permission control.

The value of **IOMMU Domain Authority Control Register** is read-only by default. Other registers can configure through system requirement. In address switch process, the corresponding relation between ACI and Domain is as follows.

Table 3-16 Relation between ACI and Domain

| ACI | Domain | Register |
|-----|-----------|---|
| 0 | Domain 0 | IOMMU Domain Authority Control Register 0 |
| 1 | Domain 1 | IOMMU Domain Authority Control Register 0 |
| 2 | Domain 2 | IOMMU Domain Authority Control Register 1 |
| 3 | Domain 3 | IOMMU Domain Authority Control Register 1 |
| 4 | Domain 4 | IOMMU Domain Authority Control Register 2 |
| 5 | Domain 5 | IOMMU Domain Authority Control Register 2 |
| 6 | Domain 6 | IOMMU Domain Authority Control Register 3 |
| 7 | Domain 7 | IOMMU Domain Authority Control Register 3 |
| 8 | Domain 8 | IOMMU Domain Authority Control Register 4 |
| 9 | Domain 9 | IOMMU Domain Authority Control Register 4 |
| 10 | Domain 10 | IOMMU Domain Authority Control Register 5 |
| 11 | Domain 11 | IOMMU Domain Authority Control Register 5 |
| 12 | Domain 12 | IOMMU Domain Authority Control Register 6 |
| 13 | Domain 13 | IOMMU Domain Authority Control Register 6 |
| 14 | Domain 14 | IOMMU Domain Authority Control Register 7 |
| 15 | Domain 15 | IOMMU Domain Authority Control Register 7 |

After enabled **IOMMU Domain Authority Overwrite Register**, the read/write control permission can override all **IOMMU Domain Authority Control Register**.

3.11.4 Programming Guidelines

3.11.4.1 Resetting IOMMU

Before the IOMMU module software reset operation, make sure IOMMU is never opened, or all bus operations are completed, or DRAM and peripherals already open the corresponding switch, to shield the influence of IOMMU reset.

3.11.4.2 Enabling IOMMU

Before opening the IOMMU address mapping function, the **Translation Table Base Register** should be correctly configured, or all the masters are in the bypass state, or all the masters do not send the bus command.

3.11.4.3 Configuring TTB

Operating the register must close the address mapping function of IOMMU, that is, the IOMMU_ENABLE_REG[0] is 0; or the bypass function of all masters is set to 1; or the state of the TX bus command is none.

3.11.4.4 Clearing TTB

In the Flush operation, all TLB/Cache access will be suspended; but the operation entered the TLB will continue to complete before the Flush starts.

3.11.4.5 Reading/Writing VA Data

For target virtual address, read and write the corresponding physical address data to make sure whether IOMMU module address mapping function is normal. First, make sure to read or write, and then configure the target virtual address or write data, then start to read or write function, check whether the results are as expected after the operation is finished.

3.11.4.6 Using PMU Statistics Function

When PMU function is used for the first time, set **IOMMU PMU Enable Register** to enable statistics function; when reading the relevant Register, clear the enable bit of **IOMMU PMU Enable Register**; when PMU function is used next time, first **IOMMU PMU Clear Register** is set, after counter is cleared, set the enable bit of **IOMMU PMU Enable Register**.

Given a Level2 page table administers continuous 4 KB address, if Micro TLB misses in continuous virtual address, there may need to return a Level2 page table to hit from Macro TLB; but the hit number is not recorded in the Macro TLB hit and Micro TLB hit related register. So the true hit rate calculation is as follows:

$$\text{Hit Rate} = N1/M1 + (1-N1/M1)*N2/M2$$

N1: Micro TLB hit number
M1: Micro TLB access number
N2: Macro TLB hit number
M2: Macro TLB access number

3.11.5 Register List

| Module Name | Base Address |
|-------------|--------------|
| IOMMU | 0x02010000 |

| Register Name | Offset | Description |
|------------------------------|--------|---|
| IOMMU_RESET_REG | 0x0010 | IOMMU Reset Register |
| IOMMU_ENABLE_REG | 0x0020 | IOMMU Enable Register |
| IOMMU_BYPASS_REG | 0x0030 | IOMMU Bypass Register |
| IOMMU_AUTO_GATING_REG | 0x0040 | IOMMU Auto Gating Register |
| IOMMU_WBUF_CTRL_REG | 0x0044 | IOMMU Write Buffer Control Register |
| IOMMU_OOO_CTRL_REG | 0x0048 | IOMMU Out of Order Control Register |
| IOMMU_4KB_BDY_PRT_CTRL_REG | 0x004C | IOMMU 4KB Boundary Protect Control Register |
| IOMMU_TTB_REG | 0x0050 | IOMMU Translation Table Base Register |
| IOMMU_TLB_ENABLE_REG | 0x0060 | IOMMU TLB Enable Register |
| IOMMU_TLB_PREFETCH_REG | 0x0070 | IOMMU TLB Prefetch Register |
| IOMMU_TLB_FLUSH_ENABLE_REG | 0x0080 | IOMMU TLB Flush Enable Register |
| IOMMU_TLB_IVLD_MODE_SEL_REG | 0x0084 | IOMMU TLB Invalidation Mode Select Register |
| IOMMU_TLB_IVLD_STA_ADDR_REG | 0x0088 | IOMMU TLB Invalidation Start Address Register |
| IOMMU_TLB_IVLD_END_ADDR_REG | 0x008C | IOMMU TLB Invalidation End Address Register |
| IOMMU_TLB_IVLD_ADDR_REG | 0x0090 | IOMMU TLB Invalidation Address Register |
| IOMMU_TLB_IVLD_ADDR_MASK_REG | 0x0094 | IOMMU TLB Invalidation Address Mask Register |
| IOMMU_TLB_IVLD_ENABLE_REG | 0x0098 | IOMMU TLB Invalidation Enable Register |
| IOMMU_PC_IVLD_MODE_SEL_REG | 0x009C | IOMMU PC Invalidation Mode Select Register |
| IOMMU_PC_IVLD_ADDR_REG | 0x00A0 | IOMMU PC Invalidation Address Register |
| IOMMU_PC_IVLD_STA_ADDR_REG | 0x00A4 | IOMMU PC Invalidation Start Address Register |
| IOMMU_PC_IVLD_ENABLE_REG | 0x00A8 | IOMMU PC Invalidation Enable Register |
| IOMMU_PC_IVLD_END_ADDR_REG | 0x00AC | IOMMU PC Invalidation End Address Register |
| IOMMU_DM_AUT_CTRL0_REG | 0x00B0 | IOMMU Domain Authority Control 0 Register |
| IOMMU_DM_AUT_CTRL1_REG | 0x00B4 | IOMMU Domain Authority Control 1 Register |
| IOMMU_DM_AUT_CTRL2_REG | 0x00B8 | IOMMU Domain Authority Control 2 Register |
| IOMMU_DM_AUT_CTRL3_REG | 0x00BC | IOMMU Domain Authority Control 3 Register |
| IOMMU_DM_AUT_CTRL4_REG | 0x00C0 | IOMMU Domain Authority Control 4 Register |
| IOMMU_DM_AUT_CTRL5_REG | 0x00C4 | IOMMU Domain Authority Control 5 Register |
| IOMMU_DM_AUT_CTRL6_REG | 0x00C8 | IOMMU Domain Authority Control 6 Register |

| Register Name | Offset | Description |
|----------------------------|--------|--|
| IOMMU_DM_AUT_CTRL7_REG | 0x00CC | IOMMU Domain Authority Control 7 Register |
| IOMMU_DM_AUT_OVWT_REG | 0x00D0 | IOMMU Domain Authority Overwrite Register |
| IOMMU_INT_ENABLE_REG | 0x0100 | IOMMU Interrupt Enable Register |
| IOMMU_INT_CLR_REG | 0x0104 | IOMMU Interrupt Clear Register |
| IOMMU_INT_STA_REG | 0x0108 | IOMMU Interrupt Status Register |
| IOMMU_INT_ERR_ADDR0_REG | 0x0110 | IOMMU Interrupt Error Address 0 Register |

3.11.6 Register Description

3.11.6.1 0x0010 IOMMU Reset Register (Default Value: 0x8003_007F)

| Offset: 0x0010 | | | Register Name: IOMMU_RESET_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R/W | 0x1 | IOMMU_RESET IOMMU Software Reset Switch 0: Set reset signal 1: Release reset signal Before IOMMU software reset operation, ensure IOMMU never be opened; or all bus operations are completed; or DRAM and the peripherals have opened the corresponding switch, for shielding the effects of IOMMU reset. |
| 30:18 | / | / | / |

| Offset: 0x0010 | | | Register Name: IOMMU_RESET_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 17 | R/W | 0x1 | <p>PC_RST PTW Cache Reset PTW Cache address convert lane software reset switch.</p> <p>0: Set reset signal 1: Release reset signal</p> <p>When PTW Cache occurs abnormal, the bit is used to reset PTW Cache individually.</p> |
| 16 | R/W | 0x1 | <p>MTLB_RST MacroTlb Reset Macro TLB address convert lane software reset switch.</p> <p>0: Set reset signal 1: Release reset signal</p> <p>When PTW Cache occurs abnormal, the bit is used to reset PTW Cache individually.</p> |
| 15:7 | / | / | / |
| 6 | R/W | 0x1 | <p>M6_RST Master6 Reset Master6 address convert lane software reset switch.</p> <p>0: Set reset signal 1: Release reset signal</p> <p>When Master6 occurs abnormal, the bit is used to reset PTW Cache individually.</p> <p>Note: This bit is not used.</p> |
| 5 | R/W | 0x1 | <p>M5_RST Master5 Reset Master5 address convert lane software reset switch.</p> <p>0: Set reset signal 1: Release reset signal</p> <p>When Master5 occurs abnormal, the bit is used to reset PTW Cache individually.</p> |
| 4 | R/W | 0x1 | <p>M4_RST Master4 Reset Master4 address convert lane software reset switch.</p> <p>0: Set reset signal 1: Release reset signal</p> <p>When Master4 occurs abnormal, the bit is used to reset PTW Cache individually.</p> |

| Offset: 0x0010 | | | Register Name: IOMMU_RESET_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 3 | R/W | 0x1 | <p>M3_RST Master3 Reset Master3 address convert lane software reset switch. 0: Set reset signal 1: Release reset signal When Master3 occurs abnormal, the bit is used to reset PTW Cache individually.</p> |
| 2 | R/W | 0x1 | <p>M2_RST Master2 Reset Master2 address convert lane software reset switch. 0: Set reset signal 1: Release reset signal When Master2 occurs abnormal, the bit is used to reset PTW Cache individually.</p> |
| 1 | R/W | 0x1 | <p>M1_RST Master1 Reset Master1 address convert lane software reset switch. 0: Set reset signal 1: Release reset signal When Master1 occurs abnormal, the bit is used to reset PTW Cache individually.</p> |
| 0 | R/W | 0x1 | <p>M0_RST Master0 Reset Master0 address convert lane software reset switch. 0: Set reset signal 1: Release reset signal When Master0 occurs abnormal, the bit is used to reset PTW Cache individually.</p> |

3.11.6.2 0x0020 IOMMU Enable Register (Default Value: 0x0000_0000)

| Offset: 0x0020 | | | Register Name: IOMMU_ENABLE_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:1 | / | / | / |
| 0 | R/W | 0x0 | <p>ENABLE IOMMU module enable switch 0: Disable IOMMU</p> |

| Offset: 0x0020 | | | Register Name: IOMMU_ENABLE_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| | | | 1: Enable IOMMU Before IOMMU address mapping function opens, configure the Translation Table Base register; or ensure all masters are in bypass status or no the status of sending bus demand(such as reset) |

3.11.6.3 0x0030 IOMMU Bypass Register (Default Value: 0x0000_007F)

| Offset: 0x0030 | | | Register Name: IOMMU_BYPASS_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:7 | / | / | / |
| 6 | R/W | 0x1 | M6_BP Master6 bypass switch After bypass function is opened, IOMMU can not map the address of Master6 sending, and directly output the virtual address to MBUS as physical address. 0: Disable bypass function 1: Enable bypass function Note: The bit is not used. |
| 5 | R/W | 0x1 | M5_BP Master5 bypass switch After bypass function is opened, IOMMU can not map the address of Master5 sending, and directly output the virtual address to MBUS as physical address. 0: Disable bypass function 1: Enable bypass function |
| 4 | R/W | 0x1 | M4_BP Master4 bypass switch After bypass function is opened, IOMMU can not map the address of Master4 sending, and directly output the virtual address to MBUS as physical address. 0: Disable bypass function 1: Enable bypass function |
| 3 | R/W | 0x1 | M3_BP Master3 bypass switch |

| Offset: 0x0030 | | | Register Name: IOMMU_BYPASS_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| | | | <p>After bypass function is opened, IOMMU can not map the address of Master3 sending, and directly output the virtual address to MBUS as physical address.</p> <p>0: Disable bypass function 1: Enable bypass function</p> |
| 2 | R/W | 0x1 | <p>M2_BP Master2 bypass switch</p> <p>After bypass function is opened, IOMMU can not map the address of Master2 sending, and directly output the virtual address to MBUS as physical address.</p> <p>0: Disable bypass function 1: Enable bypass function</p> |
| 1 | R/W | 0x1 | <p>M1_BP Master1 bypass switch</p> <p>After bypass function is opened, IOMMU can not map the address of Master1 sending, and directly output the virtual address to MBUS as physical address.</p> <p>0: Disable bypass function 1: Enable bypass function</p> |
| 0 | R/W | 0x1 | <p>M0_BP Master0 bypass switch</p> <p>After bypass function is opened, IOMMU can not map the address of Master0 sending, and directly output the virtual address to MBUS as physical address.</p> <p>0: Disable bypass function 1: Enable bypass function</p> |

NOTE

- Operating the register belongs to non-accurate timing sequence control function. That is, before the function is valid, master operation will complete address mapping function, and any subsequent operation will not perform address mapping.
- It is suggested that master is in reset state or in no any bus operation before operating the register.

3.11.6.4 0x0040 IOMMU Auto Gating Register (Default Value: 0x0000_0001)

| Offset: 0x0040 | | | Register Name: IOMMU_AUTO_GATING_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:1 | / | / | / |
| 0 | R/W | 0x1 | IOMMU_AUTO_GATING IOMMU circuit auto gating control The purpose is to decrease power consumption of the module. 0: Disable auto gating function 1: Enable auto gating function |

3.11.6.5 0x0044 IOMMU Write Buffer Control Register (Default Value: 0x0000_007F)

| Offset: 0x0044 | | | Register Name: IOMMU_WBUF_CTRL_REG |

3.11.6.12 0x0084 IOMMU TLB Invalidation Mode Select Register (Default Value: 0x0000_0000)

| Offset: 0x0084 | | | Register Name: IOMMU_TLB_IVLD_MODE_SEL_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:1 | / | / | / |
| 0 | R/W | 0x0 | TLB_IVLD_MODE_SEL 0: Invalidate TLB by using the Mask mode 1: Invalidate TLB by using the Start and End mode |

3.11.6.13 0x0088 IOMMU TLB Invalidation Start Address Register (Default Value: 0x0000_0000)

| Offset: 0x0088 | | | Register Name: IOMMU_TLB_IVLD_STA_ADDR_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:12 | R/W | 0x0 | TLB_IVLD_STA_ADDR TLB invalid start address, 4 KB aligned. |
| 11:0 | / | / | / |

3.11.6.14 0x008C IOMMU TLB Invalidation End Address Register (Default Value: 0x0000_0000)

| Offset: 0x008C | | | Register Name: IOMMU_TLB_IVLD_END_ADDR_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:12 | R/W | 0x0 | TLB_IVLD_END_ADDR TLB invalid end address, 4 KB aligned. |
| 11:0 | / | / | / |

3.11.6.15 0x0090 IOMMU TLB Invalidation Address Register (Default Value: 0x0000_0000)

| Offset: 0x0090 | | | Register Name: IOMMU_TLB_IVLD_ADDR_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:12 | R/W | 0x0 | TLB_IVLD_ADDR TLB invalid address, 4 KB aligned |
| 11:0 | / | / | / |

Operation:

- 1) Set the virtual address that needs to be operated in **IOMMU_TLB_IVLD_ADDR_REG**.
- 2) Set the mask of virtual address that needs to be operated in **IOMMU_TLB_IVLD_ADDR_MASK_REG**.
- 3) Write '1' to **IOMMU_TLB_IVLD_ENABLE_REG[0]**.
- 4) Read **IOMMU_TLB_IVLD_ENABLE_REG[0]**, when it is '0', it indicates that invalidation behavior is finished.

NOTE

- When performing invalidation operation, TLB/Cache operation has not affected.
- After or before invalidation operation starts, there is no absolute relationship between the same address switch operation and invalidation operation.

3.11.6.16 0x0094 IOMMU TLB Invalidation Address Mask Register (Default Value: 0x0000_0000)

3.11.6.23 0x00B0 IOMMU Domain Authority Control 0 Register (Default Value: 0x0000_0000)

Software can set 15 different permission control types in IOMMU_DM_AUT_CTRL_REG0–7. A default access control type is DOMAIN0. The read/write operation of DOMAIN1–15 is unlimited by default.

Software needs to set the index of the permission control domain corresponding to the page table item in the bit[7:4] of the Level2 page table, the default value is 0 (use domain0), that is, the read/write operation is not controlled.

Setting REG_ARD_OVWT can mask the Domain control defined by IOMMU_DM_AUT_CTRL_REG0–7. All Level2 page table type are covered by the type of REG_ARD_OVWT. The read/write operation is permitted by default.

| Offset: 0x00B0 | | | Register Name: IOMMU_DM_AUT_CTRL0_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:30 | / | / | / |
| 29 | R/W | 0x0 | DM1_M6_WT_AUT_CTRL Domain1 write permission control for master6 0: The write-operation is permitted 1: The write-operation is prohibited Note: The bit is not used. |
| 28 | R/W | 0x0 | DM1_M6_RD_AUT_CTRL Domain1 read permission control for master6 0: The read-operation is permitted 1: The read-operation is prohibited Note: The bit is not used. |

3.11.6.32 0x0100 IOMMU Interrupt Enable Register (Default Value: 0x0000_0000)

Invalid page table and permission error can not make one device or multi-devices in system work normally.

Permission error usually happens in MicroTLB. The error generates interrupt and waits for processing through software.

Invalid page table usually happens in MacroTLB. The error can not influence the access of other devices. So the error page table needs go back the way it comes, but the error should not be written in each level TLB.

| 17 | W | 0x0 | L2_PAGE_TABLE_INVALID_CLR Level2 page table invalid interrupt clear bit 0: Invalid operation 1: Clear interrupt |
| 16 | W | 0x0 | L1_PAGE_TABLE_INVALID_CLR Level1 page table invalid interrupt clear bit 0: Invalid operation 1: Clear interrupt |
| 15:7 | / | / | / |
| 6 | W | 0x0 | MICRO_TLB6_INVALID_CLR Micro TLB6 permission invalid interrupt clear bit 0: Invalid operation 1: Clear interrupt Note: The bit is not used. |
| 5 | W | 0x0 | MICRO_TLB5_INVALID_CLR Micro TLB5 permission invalid interrupt clear bit 0: Invalid operation 1: Clear interrupt |
| 4 | W | 0x0 | MICRO_TLB4_INVALID_CLR Micro TLB4 permission invalid interrupt clear bit 0: Invalid operation 1: Clear interrupt |
| 3 | W | 0x0 | MICRO_TLB3_INVALID_CLR Micro TLB3 permission invalid interrupt clear bit 0: Invalid operation 1: Clear interrupt |

| Offset: 0x0104 | | | Register Name: IOMMU_INT_CLR_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 2 | W | 0x0 | MICRO_TLB2_INVALID_CLR Micro TLB2 permission invalid interrupt clear bit 0: Invalid operation 1: Clear interrupt |
| 1 | W | 0x0 | MICRO_TLB1_INVALID_CLR Micro TLB1 permission invalid interrupt clear bit 0: Invalid operation 1: Clear interrupt |
| 0 | W | 0x0 | MICRO_TLB0_INVALID_CLR Micro TLB0 permission invalid interrupt clear bit 0: Invalid operation 1: Clear interrupt |

3.11.6.34 0x0108 IOMMU Interrupt Status Register (Default Value: 0x0000_0000)

| Offset: 0x0108 | | | Register Name: IOMMU_INT_STA_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:18 | / | / | / |
| 17 | R | 0x0 | L2_PAGE_TABLE_INVALID_STA Level2 page table invalid interrupt status bit 0: Interrupt does not happen or interrupt is cleared 1: Interrupt happens |
| 16 | R | 0x0 | L1_PAGE_TABLE_INVALID_STA Level1 page table invalid interrupt status bit 0: Interrupt does not happen or interrupt is cleared 1: Interrupt happens |
| 15:7 | / | / | / |
| 6 | R | 0x0 | MICRO_TLB6_INVALID_STA Micro TLB6 permission invalid interrupt status bit 0: Interrupt does not happen or interrupt is cleared 1: Interrupt happens Note: The bit is not used. |
| 5 | R | 0x0 | MICRO_TLB5_INVALID_STA Micro TLB5 permission invalid interrupt status bit 0: Interrupt does not happen or interrupt is cleared 1: Interrupt happens |

| Offset: 0x0108 | | | Register Name: IOMMU_INT_STA_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 4 | R | 0x0 | MICRO_TLB4_INVALID_STA Micro TLB4 permission invalid interrupt status bit 0: Interrupt does not happen or interrupt is cleared 1: Interrupt happens |
| 3 | R | 0x0 | MICRO_TLB3_INVALID_STA Micro TLB3 permission invalid interrupt status bit 0: Interrupt does not happen or interrupt is cleared 1: Interrupt happens |
| 2 | R | 0x0 | MICRO_TLB2_INVALID_STA Micro TLB2 permission invalid interrupt status bit 0: Interrupt does not happen or interrupt is cleared 1: Interrupt happens |
| 1 | R | 0x0 | MICRO_TLB1_INVALID_STA Micro TLB1 permission invalid interrupt status bit 0: Interrupt does not happen or interrupt is cleared 1: Interrupt happens |
| 0 | R | 0x0 | MICRO_TLB0_INVALID_STA Micro TLB0 permission invalid interrupt status bit 0: Interrupt does not happen or interrupt is cleared 1: Interrupt happens |

3.11.6.35 0x0110 IOMMU Interrupt Error Address 0 Register (Default Value: 0x0000_0000)

| Offset: 0x0110 | | | Register Name: IOMMU_INT_ERR_ADDR0_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | INT_ERR_ADDR0 Virtual address that caused Micro TLB0 to interrupt |

3.11.6.36 0x0114 IOMMU Interrupt Error Address 1 Register (Default Value: 0x0000_0000)

| Offset: 0x0114 | | | Register Name: IOMMU_INT_ERR_ADDR1_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | INT_ERR_ADDR1 Virtual address that caused Micro TLB1 to interrupt |

3.11.6.37 0x0118 IOMMU Interrupt Error Address 2 Register (Default Value: 0x0000_0000)

| Offset: 0x0118 | | | Register Name: IOMMU_INT_ERR_ADDR2_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | INT_ERR_ADDR2 Virtual address that caused Micro TLB2 to interrupt |

3.11.6.38 0x011C IOMMU Interrupt Error Address 3 Register (Default Value: 0x0000_0000)

| Offset: 0x011C | | | Register Name: IOMMU_INT_ERR_ADDR3_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | INT_ERR_ADDR3 Virtual address that caused Micro TLB3 to interrupt |

3.11.6.39 0x0120 IOMMU Interrupt Error Address 4 Register (Default Value: 0x0000_0000)

| Offset: 0x0120 | | | Register Name: IOMMU_INT_ERR_ADDR4_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | INT_ERR_ADDR4 Virtual address that caused Micro TLB4 to interrupt |

3.11.6.40 0x0124 IOMMU Interrupt Error Address 5 Register (Default Value: 0x0000_0000)

| Offset: 0x0124 | | | Register Name: IOMMU_INT_ERR_ADDR5_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | INT_ERR_ADDR5 Virtual address that caused Micro TLB5 to interrupt |

3.11.6.41 0x0128 IOMMU Interrupt Error Address 6 Register (Default Value: 0x0000_0000)

| Offset: 0x0128 | | | Register Name: IOMMU_INT_ERR_ADDR6_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | INT_ERR_ADDR6 Virtual address that caused Micro TLB6 to interrupt |

3.11.6.42 0x0130 IOMMU Interrupt Error Address 7 Register (Default Value: 0x0000_0000)

| Offset: 0x0130 | | | Register Name: IOMMU_INT_ERR_ADDR7_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | INT_ERR_ADDR7 Virtual address that caused L1 page table to interrupt |

3.11.6.43 0x0134 IOMMU Interrupt Error Address 8 Register (Default Value: 0x0000_0000)

| Offset: 0x0134 | | | Register Name: IOMMU_INT_ERR_ADDR8_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | INT_ERR_ADDR8 Virtual address that caused L2 page table to interrupt |

3.11.6.44 0x0150 IOMMU Interrupt Error Data 0 Register (Default Value: 0x0000_0000)

| Offset: 0x0150 | | | Register Name: IOMMU_INT_ERR_DATA0_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | INT_ERR_DATA0 Corresponding page table of virtual address that caused Micro TLB0 to interrupt |

3.11.6.45 0x0154 IOMMU Interrupt Error Data 1 Register (Default Value: 0x0000_0000)

| Offset: 0x0154 | | | Register Name: IOMMU_INT_ERR_DATA1_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | INT_ERR_DATA1 Corresponding page table of virtual address that caused Micro TLB1 to interrupt |

3.11.6.46 0x0158 IOMMU Interrupt Error Data 2 Register (Default Value: 0x0000_0000)

| Offset: 0x0158 | | | Register Name: IOMMU_INT_ERR_DATA2_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | INT_ERR_DATA2 |

| Offset: 0x0158 | | | Register Name: IOMMU_INT_ERR_DATA2_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| | | | Corresponding page table of virtual address that caused Micro TLB2 to interrupt |

3.11.6.47 0x015C IOMMU Interrupt Error Data 3 Register (Default Value: 0x0000_0000)

| Offset: 0x015C | | | Register Name: IOMMU_INT_ERR_DATA3_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | INT_ERR_DATA3 Corresponding page table of virtual address that caused Micro TLB3 to interrupt |

3.11.6.48 0x0160 IOMMU Interrupt Error Data 4 Register (Default Value: 0x0000_0000)

| Offset: 0x0160 | | | Register Name: IOMMU_INT_ERR_DATA4_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | INT_ERR_DATA4 Corresponding page table of virtual address that caused Micro TLB4 to interrupt |

3.11.6.49 0x0164 IOMMU Interrupt Error Data 5 Register (Default Value: 0x0000_0000)

| Offset: 0x0164 | | | Register Name: IOMMU_INT_ERR_DATA5_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | INT_ERR_DATA5 Corresponding page table of virtual address that caused Micro TLB5 to interrupt |

3.11.6.50 0x0168 IOMMU Interrupt Error Data 6 Register (Default Value: 0x0000_0000)

| Offset: 0x0168 | | | Register Name: IOMMU_INT_ERR_DATA6_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | INT_ERR_DATA6 Corresponding page table of virtual address that caused Micro TLB6 to interrupt |

| Offset: 0x0168 | | | Register Name: IOMMU_INT_ERR_DATA6_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| | | | Note: This field is not used. |

3.11.6.51 0x0170 IOMMU Interrupt Error Data 7 Register (Default Value: 0x0000_0000)

| Offset: 0x0170 | | | Register Name: IOMMU_INT_ERR_DATA7_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | INT_ERR_DATA7 Corresponding page table of virtual address that caused L1 page table to interrupt |

3.11.6.52 0x0174 IOMMU Interrupt Error Data 8 Register (Default Value: 0x0000_0000)

| Offset: 0x0174 | | | Register Name: IOMMU_INT_ERR_DATA8_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | INT_ERR_DATA8 Corresponding page table of virtual address that caused L2 page table to interrupt |

3.11.6.53 0x0180 IOMMU L1 Page Table Interrupt Register (Default Value: 0x0000_0000)

| Offset: 0x0180 | | | Register Name: IOMMU_L1PG_INT_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R | 0x0 | DBG_MODE_L1PG_INT Debug mode address switch causes L1 page table to occur interrupt. |
| 30:7 | / | / | / |
| 6 | R | 0x0 | MASTER6_L1PG_INT Master6 address switch causes L1 page table to occur interrupt. Note: The bit is not used. |
| 5 | R | 0x0 | MASTER5_L1PG_INT Master5 address switch causes L1 page table to occur interrupt. |
| 4 | R | 0x0 | MASTER4_L1PG_INT Master4 address switch causes L1 page table to occur interrupt. |
| 3 | R | 0x0 | MASTER3_L1PG_INT |

| Offset: 0x0180 | | | Register Name: IOMMU_L1PG_INT_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| | | | Master3 address switch causes L1 page table to occur interrupt. |
| 2 | R | 0x0 | MASTER2_L1PG_INT Master2 address switch causes L1 page table to occur interrupt. |
| 1 | R | 0x0 | MASTER1_L1PG_INT Master1 address switch causes L1 page table to occur interrupt. |
| 0 | R | 0x0 | MASTER0_L1PG_INT Master0 address switch causes L1 page table to occur interrupt. |

3.11.6.54 0x0184 IOMMU L2 Page Table Interrupt Register (Default Value: 0x0000_0000)

| Offset: 0x0184 | | | Register Name: IOMMU_L2PG_INT_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R | 0x0 | DBG_MODE_L2PG_INT Debug mode address switch causes L2 page table to occur interrupt. |
| 30:7 | / | / | / |
| 6 | R | 0x0 | MASTER6_L2PG_INT Master6 address switch causes L2 page table to occur interrupt. Note: The bit is not used. |
| 5 | R | 0x0 | MASTER5_L2PG_INT Master5 address switch causes L2 page table to occur interrupt. |
| 4 | R | 0x0 | MASTER4_L2PG_INT Master4 address switch causes L2 page table to occur interrupt. |
| 3 | R | 0x0 | MASTER3_L2PG_INT Master3 address switch causes L2 page table to occur interrupt. |
| 2 | R | 0x0 | MASTER2_L2PG_INT Master2 address switch causes L2 page table to occur interrupt. |
| 1 | R | 0x0 | MASTER1_L2PG_INT Master1 address switch causes L2 page table to occur interrupt. |
| 0 | R | 0x0 | MASTER0_L2PG_INT Master0 address switch causes L2 page table to occur interrupt. |

3.11.6.55 0x0190 IOMMU Virtual Address Register (Default Value: 0x0000_0000)

| Offset: 0x0190 | | | Register Name: IOMMU_VA_REG |
|----------------|------------|-------------|-------------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | VA Virtual address of read/write |

3.11.6.56 0x0194 IOMMU Virtual Address Data Register (Default Value: 0x0000_0000)

| Offset: 0x0194 | | | Register Name: IOMMU_VA_DATA_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | VA_DATA Data corresponding to read/write virtual address |

3.11.6.57 0x0198 IOMMU Virtual Address Configuration Register (Default Value: 0x0000_0000)

| Offset: 0x0198 | | | Register Name: IOMMU_VA_CONFIG_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R/W | 0x0 | MODE_SEL 0: Prefetch 1: Debug Mode It is used to chose prefetch mode or Debug mode. |
| 31:9 | / | / | / |
| 8 | R/W | 0x0 | VA_CONFIG Virtual Address Configuration 0: Read operation 1: Write operation |
| 7:1 | / | / | / |
| 0 | R/WAC | 0x0 | VA_CONFIG_START 0: No operation or operation is completed 1: Start After the operation is completed, the bit can clear automatically. |

Read operation process:

- a) Write IOMMU_VA_REG[31:0];
- b) Write IOMMU_VA_CONFIG_REG[8] to 0;
- c) Write IOMMU_VA_CONFIG_REG[0] to 1 to start read-process;
- d) Query IOMMU_VA_CONFIG_REG[0] until it is 0;

e) Read IOMMU_VA_DATA_REG[31:0];

Write operation process:

- a) Write IOMMU_VA_REG[31:0];
- b) Write IOMMU_VA_DATA_REG[31:0];
- c) Write IOMMU_VA_CONFIG_REG[8] to 1;
- d) Write IOMMU_VA_CONFIG_REG[0] to 1 to start write-process;
- e) Query IOMMU_VA_CONFIG_REG[0] until it is 0;

3.11.6.58 0x0200 IOMMU PMU Enable Register (Default Value: 0x0000_0000)

| Offset: 0x0200 | | | Register Name: IOMMU_PMU_ENABLE_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:1 | / | / | / |
| 0 | R/W | 0x0 | PMU_ENABLE 0: Disable statistical function 1: Enable statistical function |

3.11.6.59 0x0210 IOMMU PMU Clear Register (Default Value: 0x0000_0000)

| Offset: 0x0210 | | | Register Name: IOMMU_PMU_CLR_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:1 | / | / | / |
| 0 | R/WAC | 0x0 | PMU_CLR 0: No clear operation or clear operation is completed 1: Clear counter data After the operation is completed, the bit can clear automatically. |

3.11.6.60 0x0230 IOMMU PMU Access Low 0 Register (Default Value: 0x0000_0000)

| Offset: 0x0230 | | | Register Name: IOMMU_PMU_ACCESS_LOW0_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | PMU_ACCESS_LOW0 Record total number of Micro TLB0 access, lower 32-bit register |

3.11.6.61 0x0234 IOMMU PMU Access High 0 Register (Default Value: 0x0000_0000)

| Offset: 0x0234 | | | Register Name: IOMMU_PMU_ACCESS_HIGH0_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:11 | / | / | / |
| 10:0 | R | 0x0 | PMU_ACCESS_HIGH0 Record total number of Micro TLB0 access, higher 11-bit register |

3.11.6.62 0x0238 IOMMU PMU Hit Low 0 Register (Default Value: 0x0000_0000)

| Offset: 0x0238 | | | Register Name: IOMMU_PMU_HIT_LOW0_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | PMU_HIT_LOW0 Record total number of Micro TLB0 hit, lower 32-bit register |

3.11.6.63 0x023C IOMMU PMU Hit High 0 Register (Default Value: 0x0000_0000)

| Offset: 0x023C | | | Register Name: IOMMU_PMU_HIT_HIGH0_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:11 | / | / | / |
| 10:0 | R | 0x0 | PMU_HIT_HIGH0 Record total number of Micro TLB0 hit, higher 11-bit register |

3.11.6.64 0x0240 IOMMU PMU Access Low 1 Register (Default Value: 0x0000_0000)

| Offset: 0x0240 | | | Register Name: IOMMU_PMU_ACCESS_LOW1_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | PMU_ACCESS_LOW1 Record total number of Micro TLB1 access, lower 32-bit register |

3.11.6.65 0x0244 IOMMU PMU Access High 1 Register (Default Value: 0x0000_0000)

| Offset: 0x0244 | | | Register Name: IOMMU_PMU_ACCESS_HIGH1_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:11 | / | / | / |

| Offset: 0x0244 | | | Register Name: IOMMU_PMU_ACCESS_HIGH1_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 10:0 | R | 0x0 | PMU_ACCESS_HIGH1 Record total number of Micro TLB1 access, higher 11-bit register |

3.11.6.66 0x0248 IOMMU PMU Hit Low 1 Register (Default Value: 0x0000_0000)

| Offset: 0x0248 | | | Register Name: IOMMU_PMU_HIT_LOW1_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | PMU_HIT_LOW1 Record total number of Micro TLB1 hit, lower 32-bit register |

3.11.6.67 0x024C IOMMU PMU Hit High 1 Register (Default Value: 0x0000_0000)

| Offset: 0x024C | | | Register Name: IOMMU_PMU_HIT_HIGH1_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:11 | / | / | / |
| 10:0 | R | 0x0 | PMU_HIT_HIGH1 Record total number of Micro TLB1 hit, higher 11-bit register |

3.11.6.68 0x0250 IOMMU PMU Access Low 2 Register (Default Value: 0x0000_0000)

| Offset: 0x0250 | | | Register Name: IOMMU_PMU_ACCESS_LOW2_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | PMU_ACCESS_LOW2 Record total number of Micro TLB2 access, lower 32-bit register |

3.11.6.69 0x0254 IOMMU PMU Access High 2 Register (Default Value: 0x0000_0000)

| Offset: 0x0254 | | | Register Name: IOMMU_PMU_ACCESS_HIGH2_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:11 | / | / | / |
| 10:0 | R | 0x0 | PMU_ACCESS_HIGH2 Record total number of Micro TLB2 access, higher 11-bit register |

3.11.6.70 0x0258 IOMMU PMU Hit Low 2 Register (Default Value: 0x0000_0000)

| Offset: 0x0258 | | | Register Name: IOMMU_PMU_HIT_LOW2_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | PMU_HIT_LOW2 Record total number of Micro TLB2 hit, lower 32-bit register |

3.11.6.71 0x025C IOMMU PMU Hit High 2 Register (Default Value: 0x0000_0000)

| Offset: 0x025C | | | Register Name: IOMMU_PMU_HIT_HIGH2_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:11 | / | / | / |
| 10:0 | R | 0x0 | PMU_HIT_HIGH2 Record total number of Micro TLB2 hit, higher 11-bit register |

3.11.6.72 0x0260 IOMMU PMU Access Low 3 Register (Default Value: 0x0000_0000)

| Offset: 0x0260 | | | Register Name: IOMMU_PMU_ACCESS_LOW3_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | PMU_ACCESS_LOW3 Record total number of Micro TLB3 access, lower 32-bit register |

3.11.6.73 0x0264 IOMMU PMU Access High 3 Register (Default Value: 0x0000_0000)

| Offset: 0x0264 | | | Register Name: IOMMU_PMU_ACCESS_HIGH3_REG |
|----------------|------------|-------------|--|

| 17:0 | R | 0x0 | PMU_TL_HIGH3 Record total latency of Master3, higher 18-bit register |

3.11.6.107 0x0338 IOMMU Max Latency 3 Register (Default Value: 0x0000_0000)

| Offset: 0x0338 | | | Register Name: IOMMU_PMU_ML3_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | PMU_ML3 Record the max latency of Master3. |

3.11.6.108 0x0340 IOMMU Total Latency Low 4 Register (Default Value: 0x0000_0000)

| Offset: 0x0340 | | | Register Name: IOMMU_PMU_TL_LOW4_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | PMU_TL_LOW4 Record total latency of Master4, lower 32-bit register |

3.11.6.109 0x0344 IOMMU Total Latency High 4 Register (Default Value: 0x0000_0000)

| Offset: 0x0344 | | | Register Name: IOMMU_PMU_TL_HIGH4_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:18 | / | / | / |
| 17:0 | R | 0x0 | PMU_TL_HIGH4 Record total latency of Master4, higher 18-bit register |

3.11.6.110 0x0348 IOMMU Max Latency 4 Register (Default Value: 0x0000_0000)

| Offset: 0x0348 | | | Register Name: IOMMU_PMU_ML4_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | PMU_ML4 Record the max latency of Master4. |

3.11.6.111 0x0350 IOMMU Total Latency Low 5 Register (Default Value: 0x0000_0000)

| Offset: 0x0350 | | | Register Name: IOMMU_PMU_TL_LOW5_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | PMU_TL_LOW5 Record total latency of Master5, lower 32-bit register |

3.11.6.112 0x0354 IOMMU Total Latency High 5 Register (Default Value: 0x0000_0000)

| Offset: 0x0354 | | | Register Name: IOMMU_PMU_TL_HIGH5_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:18 | / | / | / |
| 17:0 | R | 0x0 | PMU_TL_HIGH5 Record total latency of Master5, higher 18-bit register |

3.11.6.113 0x0358 IOMMU Max Latency 5 Register (Default Value: 0x0000_0000)

| Offset: 0x0358 | | | Register Name: IOMMU_PMU_ML5_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | PMU_ML5 Record the max latency of Master5. |

3.11.6.114 0x0360 IOMMU Total Latency Low 6 Register (Default Value: 0x0000_0000)

| Offset: 0x0360 | | | Register Name: IOMMU_PMU_TL_LOW6_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | PMU_TL_LOW6 Record total latency of Master6, lower 32-bit register Note: The field is not used. |

3.11.6.115 0x0364 IOMMU Total Latency High 6 Register (Default Value: 0x0000_0000)

| Offset: 0x0364 | | | Register Name: IOMMU_PMU_TL_HIGH6_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:18 | / | / | / |
| 17:0 | R | 0x0 | PMU_TL_HIGH6 Record total latency of Master6, higher 18-bit register Note: The field is not used. |

3.11.6.116 0x0368 IOMMU Max Latency 6 Register (Default Value: 0x0000_0000)

| Offset: 0x0368 | | | Register Name: IOMMU_PMU_ML6_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | PMU_ML6 Record the max latency of Master6. Note: The field is not used. |

3.12 Message Box

3.12.1 Overview

The Message Box (MSGBOX) provides interrupt communication mechanism for on-chip processor.

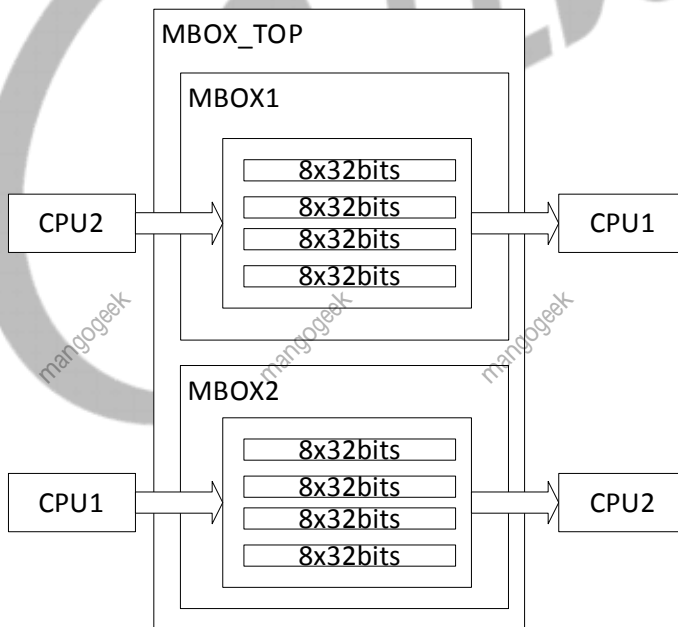

The MSGBOX has the following features:

- Supports 2 CPU to transmit information through channels. Each CPU has a MSGBOX.
 - CPU 1: DSP
 - CPU 2: RISC-V
- The channel between two CPU has 4 channels, and the FIFO depth of a channel is 8 x 32 bits
- Supports interrupts

3.12.2 Block Diagram

The following figure shows the block diagram of the message box.

Figure 3-35 Message Box Block Diagram

For MSGBOX1, CPU2: write; CPU1: read
 For MSGBOX2, CPU1: write; CPU2: read

3.12.3 Functional Description

3.12.3.1 Clock and Reset

The MSGBOX is mounted on AHB0. Before accessing the MSGBOX registers, you need to de-assert the MSGBOX reset signal on AHB0 bus and then open the MSGBOX gating signal on AHB0 bus.

3.12.3.2 Typical Application

Several masters can build communication by configuring the MSGBOX. The communication parties have 4 channels. In a channel, the user1 is fixed as the transmitter and the user0 is fixed as the receiver. During the communication process, the current status can be judged through the interrupt or FIFO status.

3.12.3.3 Transmitter/Receiver Mode

At the same channel, user1 is fixed as transmitter, user0 is fixed as receiver.

3.12.3.4 Interrupt

Each channel can configure independently the interrupt enable bit, a read interrupt will be generated when the channel is empty, a write interrupt will be generated when the channel is non-full. For each CPU, all channels generate a read interrupt together, that is, if only a channel is non-full, the read interrupt will be generated, this channel can be obtained by quering the interrupt status register.

3.12.3.5 FIFO Status

When channel FIFO is non-full, the FIFO_FULL_FLAG is 0, at the moment the FIFO can be written.

When channel FIFO is full, the FIFO_FULL_FLAG is 1, at the moment if FIFO is written again, the first data of FIFO can be covered.

See [MSGBOX_MSG_STATUS_REG](#) for FIFO status.

3.12.4 Programming Guidelines

3.12.4.1 Checking the Transfer Status via the Interrupt

Follow the steps below to check the transfer status:

Step 1 Enable the interrupt for the channel: Configure the interrupt enable bits of transmitter/receiver through [MSGBOX_WR_IRQ_EN_REG/MSGBOX_RD_IRQ_EN_REG](#). (user1: RX interrupt enable; user2: TX interrupt enable)

Step 2 Check the IRQ status of the corresponding queue through [MSGBOX_WR_IRQ_STATUS_REG/MSGBOX_RD_IRQ_STATUS_REG](#).

- If the FIFO is not full, the channel generates a transmission interrupt to remind the transmitter to transmit data. Write data to the FIFO in the interrupt handler, then clear the pending bit of the transmitter in [MSGBOX_WR_IRQ_STATUS_REG](#) and the enable bit of the transmitter in [MSGBOX_WR_IRQ_EN_REG](#).
- If the FIFO has new data, the channel generates a reception interrupt to remind the receiver to receive data. Read data from the FIFO in interrupt handler, then clear the pending bit of the receiver in [MSGBOX_RD_IRQ_STATUS_REG](#) and the enable bit of the receiver in [MSGBOX_RD_IRQ_EN_REG](#).

3.12.4.2 Checking the Transfer Status via the FIFO

Follow the steps below to check the FIFO status of the corresponding queue:

- If the FIFO is not full, the transmitter fills the FIFO to 8*32 bits.
- If the FIFO is full, the receiver reads the FIFO data, and reads [MSGBOX_FIFO_STATUS_REG](#) to acquire the current FIFO data amount and the FIFO data amount before reading, which means no data is dropped.

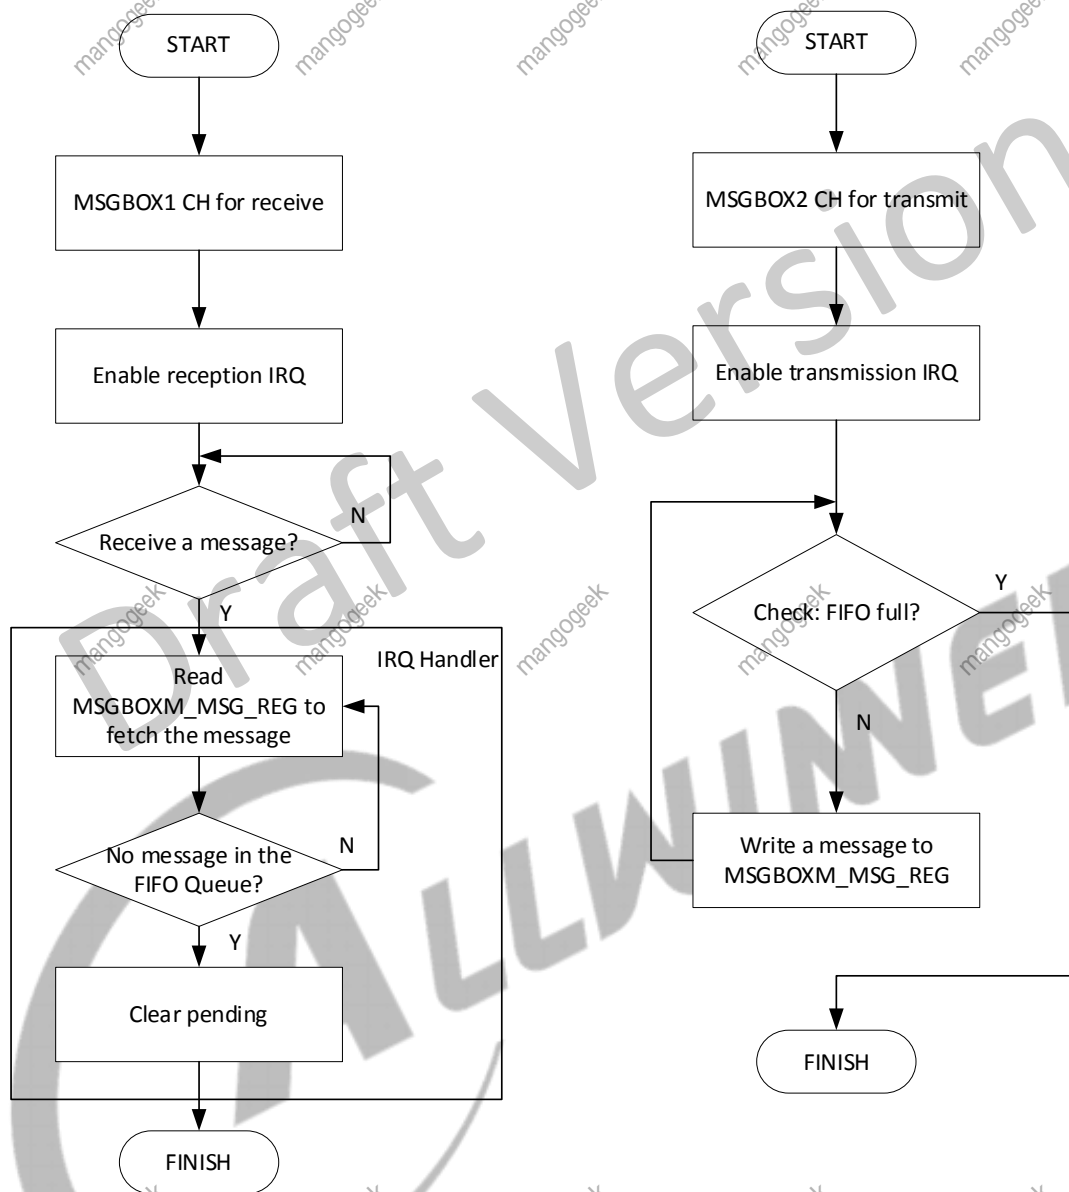

3.12.4.3 Transmitting/Receiving Message

The following figure shows an example of communication process between MSGBOX1 and MSGBOX2.

MSGBOX1: receiving message

MSGBOX2: transmitting message

Figure 3-36 The Communication Process between MSGBOX1 and MSGBOX2

3.12.5 Register List

| Module Name | Base Address |
|---------------|--------------|
| DSP_MSGBOX | 0x01701000 |
| RISC-V_MSGBOX | 0x0601F000 |

| Symbol | Description | Value |
|--------|--|-------|
| N | The CPU numbers that communicates with the current CPU | 0–1 |
| P | The channel numbers between two communication CPU | 0–3 |

| MSGBOX | CPU | The Value of N |
|-----------------|---------------|----------------|
| MSGBOX (DSP) | RISC-V -> DSP | N=1 |
| MSGBOX (RISC-V) | DSP -> RISC-V | N=1 |

| Register Name | Offset | Description |
|-----------------------------|---|-------------------------------------|
| MSGBOX_RD_IRQ_EN_REG | 0x0020+N*0x0100 (N=0-1) | MSGBOX Read IRQ Enable Register |
| MSGBOX_RD_IRQ_STATUS_REG | 0x0024+N*0x0100 (N=0-1) | MSGBOX Read IRQ Status Register |
| MSGBOX_WR_IRQ_EN_REG | 0x0030+N*0x0100 (N=0-1) | MSGBOX Write IRQ Enable Register |
| MSGBOX_WR_IRQ_STATUS_REG | 0x0034+N*0x0100 (N=0-1) | MSGBOX Write IRQ Status Register |
| MSGBOX_DEBUG_REG | 0x0040+N*0x0100 (N=0-1) | MSGBOX Debug Register |
| MSGBOX_FIFO_STATUS_REG | 0x0050+N*0x0100+P*0x0004 (N=0-1)(P=0-3) | MSGBOX FIFO Status Register |
| MSGBOX_MSG_STATUS_REG | 0x0060+N*0x0100+P*0x0004 (N=0-1)(P=0-3) | MSGBOX Message Status Register |
| MSGBOX_MSG_REG | 0x0070+N*0x0100+P*0x0004 (N=0-1)(P=0-3) | MSGBOX Message Queue Register |
| MSGBOX_WR_INT_THRESHOLD_REG | 0x0080+N*0x0100+P*0x0004 (N=0-1)(P=0-3) | MSGBOX Write IRQ Threshold Register |

3.12.6 Register Description

3.12.6.1 0x0020 + N*0x0100 MSGBox Read IRQ Enable Register (Default Value: 0x0000_0000)

| Offset: 0x0020 + N*0x0100 (N=0-1) | | | Register Name: MSGBOX_RD_IRQ_EN_REG |
|-----------------------------------|------------|-------------|-------------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:7 | / | / | / |

| Offset: 0x0020 + N*0x0100 (N=0-1) | | | Register Name: MSGBOX_RD_IRQ_EN_REG |
|-----------------------------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 6 | R/W | 0x0 | RECEPTION_MQ3_IRQ_EN Reception Channel3 Interrupt Enable 0: Disable 1: Enable (It notifies user 0 by interrupt when Message Queue 3 received a new message.) |
| 5 | / | / | / |
| 4 | R/W | 0x0 | RECEPTION_MQ2_IRQ_EN Reception Channel2 Interrupt Enable 0: Disable 1: Enable (It notifies user 0 by interrupt when Message Queue 2 received a new message.) |
| 3 | / | / | / |

3.13 Spinlock

3.13.1 Overview

The spinlock provides hardware synchronization mechanism in multi-core systems. With the lock operation, the spinlock prevents multiple processors from handling the sharing data simultaneously and thus ensure the coherence of data.

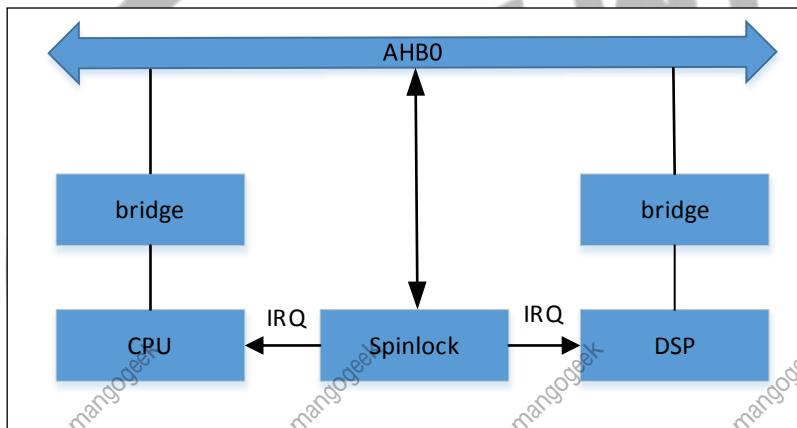

The spinlock has the following features:

- Supports 32 lock units
- Two kinds of lock status: locked and unlocked
- Lock time of the processor is predictable (less than 200 cycles)

3.13.2 Block Diagram

The following figure shows the block diagram of the spinlock.

Figure 3-37 Spinlock Block Diagram

3.13.3 Functional Description

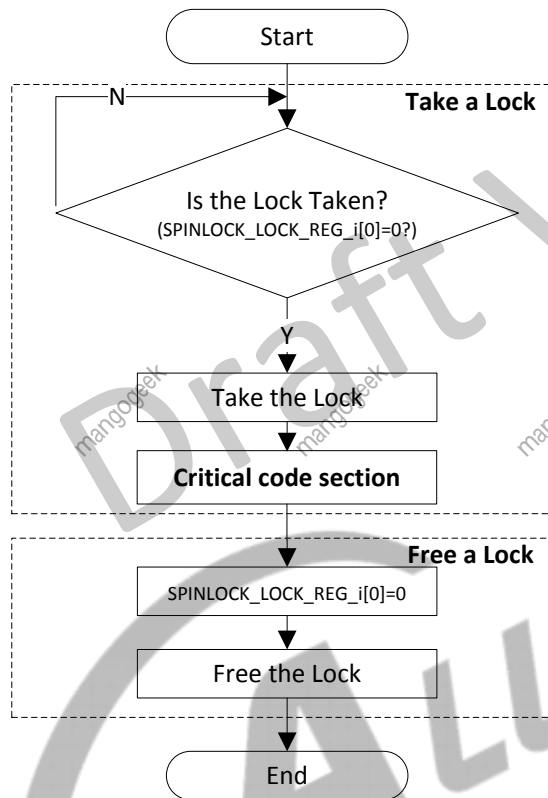

3.13.3.1 Clock and Reset

The spinlock is mounted on AHB0. Before accessing the spinlock registers, you need to de-assert the reset signal on AHB0 bus and then open the corresponding gating signal on AHB0 bus.

3.13.3.2 Typical Application

The following figure shows a typical application of the spinlock. A processor locks spinlock0 before executing specific codes, and then unlocks the codes. After the lock is freed, other processors can read or write the data.

Figure 3-38 Spinlock Typical Application Diagram

3.13.3.3 Spinlock State Machine

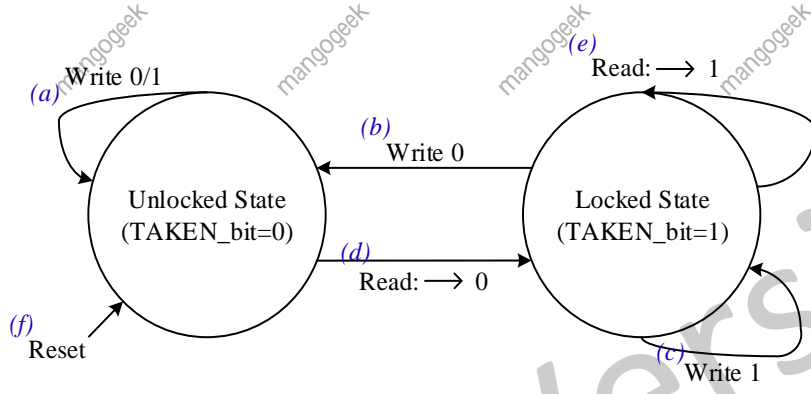

When a processor uses spinlock, it needs to acquire the spinlock status through [SPINLOCK STATUS REG](#).

Reading operation: when the return value is 0, it indicates that the spinlock enters the locked status; reading this status bit again can return 1, it indicates that the spinlock is the locked status.

Writing operation: when the spinlock is in the locked status, writing 0 can convert the spinlock to the unlocked status, the writing operation for other status is invalid.

The following figure shows the spinlock state machine.

Figure 3-39 Spinlock State Machine

- a) When the spinlock is in the unlocked state, writing 0/1 has no effect;
- b) When the spinlock is in the locked state, writing 0 can convert the corresponding spinlock to the unlocked state;
- c) When the spinlock is in the locked state, writing 1 has no effect;
- d) When the spinlock is in the unlocked state, reading the bit can return 0 (it indicates spinlock enters into the locked state);
- e) When the spinlock is in the locked state, reading the bit can return 1 (it indicates spinlock is in the locked state);
- f) After reset, the spinlock is in the unlock state by default.

3.13.4 Programming Guidelines

3.13.4.1 Switching the Status

Follow the steps below to switch the lock status of a spinlock.

- Step 1** When the read value from [SPINLOCKN_LOCK_REG \(N=0-31\)](#) is 0, the spinlock comes into the locked status.
- Step 2** Execute the application codes, and the status of [SPINLOCK_STATUS_REG](#) is 1.
- Step 3** Write 0 to [SPINLOCKN_LOCK_REG \(N=0-31\)](#), the spinlock converts into the unlocked status, and the corresponding spinlock is released.

3.13.4.2 Processing the Interrupt

The spinlock generates an interrupt when a lock is freed (the lock status converts from the locked status to the unlocked status).

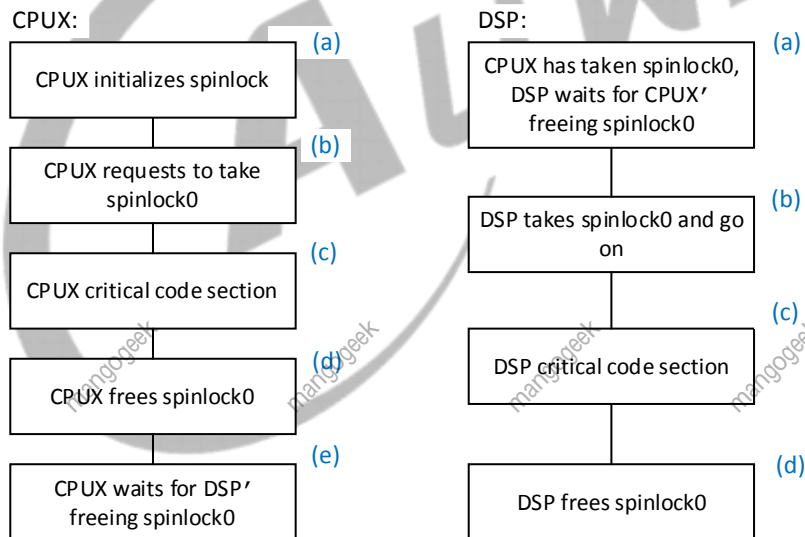

Follow the steps below to process the interrupt:

- Step 1** Configure the interrupt enable bit of the corresponding spinlock in [SPINLOCK_IRQ_EN_REG](#) to enable the interrupt.
- Step 2** The spinlock generates an interrupt when its status converts from the locked status to the unlocked status, and the corresponding bit of the [SPINLOCK_IRQ_STA_REG](#) turns to 1.
- Step 3** Execute the interrupt handle function and clear the pending bit.

3.13.4.3 Taking/Freeing Spinlock

Take the synchronization between CPUX and DSP with Spinlock0 as an example, the CPUX and DSP perform the following steps.

Figure 3-40 CPUX and DSP Taking/Freeing Spinlock0 Process

CPUX:

- (a) The CPUX initializes Spinlock.
- (b) Check lock register0 (SPINLOCK_STATUS_REG0) status. If it is taken, check until CPUX frees spinlock0 and then request to take spinlock0. Otherwise, retry until the lock register0 is taken.
- (c) Execute CPUX critical code.

- (d) After executing CPUX critical code, the CPUX frees spinlock0.
- (e) The CPUX waits for DSP to free spinlock0.

DSP:

- (a) If the CPUX has taken spinlock0, the DSP waits for CPUX to free spinlock0.
- (b) The DSP requests to take spinlock0. If it fails, retry until the lock register0 is taken.
- (c) Execute DSP critical code.
- (d) After executing DSP critical code, the DSP frees spinlock0.

The following codes are for reference.

-----**CPUX**-----

Step 1 CPUX initializes Spinlock

```
put_wvalue(SPINLOCK_BGR_REG,0x00010000);
put_wvalue(SPINLOCK_BGR_REG,0x00010001);
```

Step 2 CPUX requests to take spinlock0

```
rdata=readl(SPINLOCK_STATUS_REG0); //Check lock register0 status
if(rdata != 0) writel(0, SPINLOCK_LOCK_REG0); //If it is taken, check till CPUX frees spinlock0
rdata=readl(SPINLOCK_LOCK_REG0); //Request to take spinlock0
if(rdata != 0) rdata=readl(SPINLOCK_LOCK_REG0); //If it fails, retry till lock register0 is taken
```

-----**CPUX critical code section**-----

Step 3 CPUX frees spinlock0

```
writel(0, SPINLOCK_LOCK_REG0); //CPUX frees spinlock0
```

Step 4 CPUX waits for DSP' freeing spinlock0

```
writel(readl(SPINLOCK_STATUS_REG0) == 1); //CPUX waits for DSP' freeing spinlock0
```

-----**DSP**-----

Step 1 CPUX has taken spinlock0, DSP waits for CPUX' freeing spinlock0

```
while(readl(SPINLOCK_STATUS_REG0) == 1); //DSP waits for CPUX' freeing spinlock0
```

Step 2 DSP takes spinlock0 and go on

```
rdata=readl(SPINLOCK_LOCK_REG0); //Request to take spinlock0
if(rdata != 0) rdata=readl(SPINLOCK_LOCK_REG0); //If it fails, retry till lock register0 is taken
```

----- DSP critical code section -----

Step 3 DSP frees spinlock0

```
writel(0, SPINLOCK_LOCK_REG0);
```

```
//DSP frees spinlock0
```

3.13.5 Register List

| Module Name | Base Address |
|-------------|--------------|
| Spinlock | 0x03005000 |

| Register Name | Offset | Description |
|-----------------------|-------------------|------------------------------------|
| SPINLOCK_SYSTATUS_REG | 0x0000 | Spinlock System Status Register |
| SPINLOCK_STATUS_REG | 0x0010 | Spinlock Status Register |
| SPINLOCK_IRQ_EN_REG | 0x0020 | Spinlock Interrupt Enable Register |
| SPINLOCK_IRQ_STA_REG | 0x0040 | Spinlock Interrupt Status Register |
| SPINLOCK_LOCKID0_REG | 0x0080 | Spinlock Lockid0 Register |
| SPINLOCK_LOCKID1_REG | 0x0084 | Spinlock Lockid1 Register |
| SPINLOCK_LOCKID2_REG | 0x0088 | Spinlock Lockid2 Register |
| SPINLOCK_LOCKID3_REG | 0x008C | Spinlock Lockid3 Register |
| SPINLOCK_LOCKID4_REG | 0x0090 | Spinlock Lockid4 Register |
| SPINLOCK_LOCK_REGN | 0x0100 + N*0x0004 | Spinlock Register N (N = 0 to 31) |

3.13.6 Register Description

3.13.6.1 0x0000 Spinlock System Status Register (Default Value: 0x1000_0000)

| Offset: 0x0000 | | | Register Name: SPINLOCK_SYSTATUS_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:30 | / | / | / |
| 29:28 | R | 0x1 | LOCKS_NUM Number of lock registers implemented 00: This instance has 256 lock registers 01: This instance has 32 lock registers 10: This instance has 64 lock registers 11: This instance has 128 lock registers |

| Offset: 0x0000 | | | Register Name: SPINLOCK_SYSTATUS_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 27:9 | / | / | / |
| 8 | R | 0x0 | IU0 In-Use flag0, covering lock register0-31 0: All lock registers 0-31 are in the NotTaken state. 1: At least one of the lock register 0-31 is in the Taken state. |
| 7:0 | / | / | / |

3.13.6.2 0x0010 Spinlock Register Status Register (Default Value: 0x0000_0000)

| Offset: 0x0010 | | | Register Name: SPINLOCK_STATUS_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | LOCK_REG_STATUS SpinLock[i] status 0: The Spinlock is free 1: The Spinlock is taken |

3.13.6.3 0x0020 Spinlock Interrupt Enable Register (Default Value: 0x0000_0000)

| Offset: 0x0020 | | | Register Name: SPINLOCK_IRQ_EN_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | LOCK_IRQ_EN SpinLock[i] interrupt enable 0: Disable 1: Enable |

3.13.6.4 0x0040 Spinlock Interrupt Status Register (Default Value: 0x0000_0000)

| Offset: 0x0040 | | | Register Name: SPINLOCK_IRQ_STA_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W1C | 0x0 | LOCK_IRQ_STATUS SpinLock[i] interrupt status 0: No effect 1: Pending Writing 1 clears this bit. |

3.13.6.5 0x0080 Spinlock Lockid0 Register (Default Value: 0x7777_7777)

| Offset: 0x0080 | | | Register Name: SPINLOCK_LOCKIN0_REG |
|----------------|------------|-------------|-------------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x77777777 | LOCKID0 |

3.13.6.6 0x0084 Spinlock Lockid1 Register (Default Value: 0x7777_7777)

| Offset: 0x0084 | | | Register Name: SPINLOCK_LOCKIN1_REG |
|----------------|------------|-------------|-------------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x77777777 | LOCKID1 |

3.13.6.7 0x0088 Spinlock Lockid2 Register (Default Value: 0x7777_7777)

| Offset: 0x0088 | | | Register Name: SPINLOCK_LOCKIN2_REG |
|----------------|------------|-------------|-------------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x77777777 | LOCKID2 |

3.13.6.8 0x008C Spinlock Lockid3 Register (Default Value: 0x7777_7777)

| Offset: 0x008C | | | Register Name: SPINLOCK_LOCKIN3_REG |
|----------------|------------|-------------|-------------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x77777777 | LOCKID3 |

3.13.6.9 0x0090 Spinlock Lockid4 Register (Default Value: 0x7777_7777)

| Offset: 0x0090 | | | Register Name: SPINLOCK_LOCKIN4_REG |
|----------------|------------|-------------|-------------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x77777777 | LOCKID4 |

3.13.6.10 0x0100 + N*0x04 Spinlock Register N (N = 0 to 31) (Default Value: 0x0000_0000)

| Offset: 0x0100 + N*0x0004 (N = 0 to 31) | | | Register Name: SPINLOCKN_LOCK_REG |
|---|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:1 | / | / | / |
| 0 | R/W | 0x0 | <p>TAKEN</p> <p>Lock State</p> <p>Read 0x0: The lock was previously Not Taken (free). The requester is granted the lock.</p> <p>Write 0x0: Set the lock to Not Taken (free).</p> <p>Read 0x1: The lock was previously Taken. The requester is not granted the lock and must retry.</p> <p>Write 0x1: No update to the lock value.</p> |

3.14 RTC

3.14.1 Overview

The Real Time Clock (RTC) is used to implement time counter and timing wakeup functions. The RTC can display the year, month, day, week, hour, minute, second in real time. The RTC has the independent power to continue to work in system power-off.

The RTC has the following features:

- Provides a 16-bit counter for counting day, 5-bit counter for counting hour, 6-bit counter for counting minute, 6-bit counter for counting second
- External connect a 32.768 kHz low-frequency oscillator for count clock
- Timer frequency is 1 kHz
- Configurable initial value by software anytime
- Supports timing alarm, and generates interrupt and wakeup the external devices
- Eight 32-bit user registers for storing power-off information

CAUTION

The register configuration of RTC is AHB bus, it only can support word operation, not byte operation and half-word operation.

3.14.2 Block Diagram

The following figure shows the block diagram of the RTC.

Figure 3-41 RTC Block Diagram

3.14.3 Functional Description

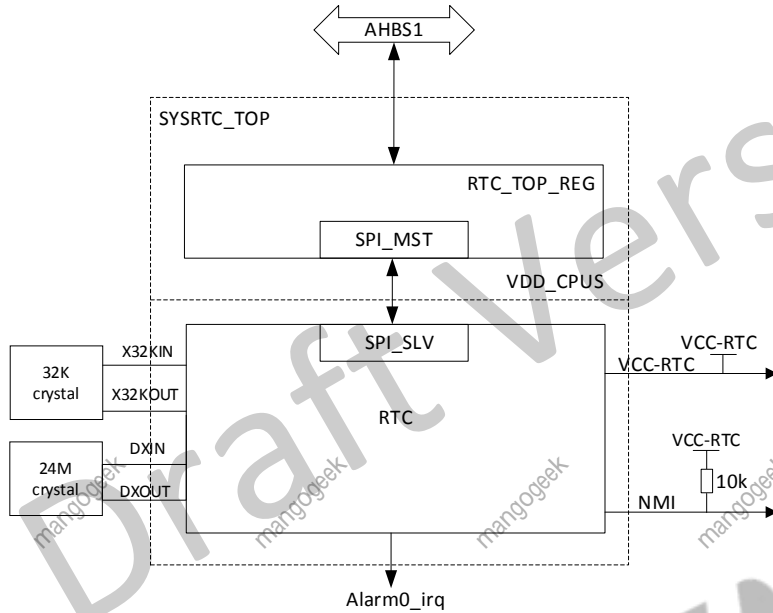

3.14.3.1 External Signals

Table 3-17 RTC External Signals

| Signal | Description |
|---------|---|
| X32KIN | 32.768 kHz oscillator input |
| X32KOUT | 32.768 kHz oscillator output |
| NMI | Non-maskable Interrupt Alarm wakeup generates low level into NMI |
| VCC-RTC | RTC high voltage, generated via external power |

3.14.3.2 Typical Application

Figure 3-42 RTC Application Diagram

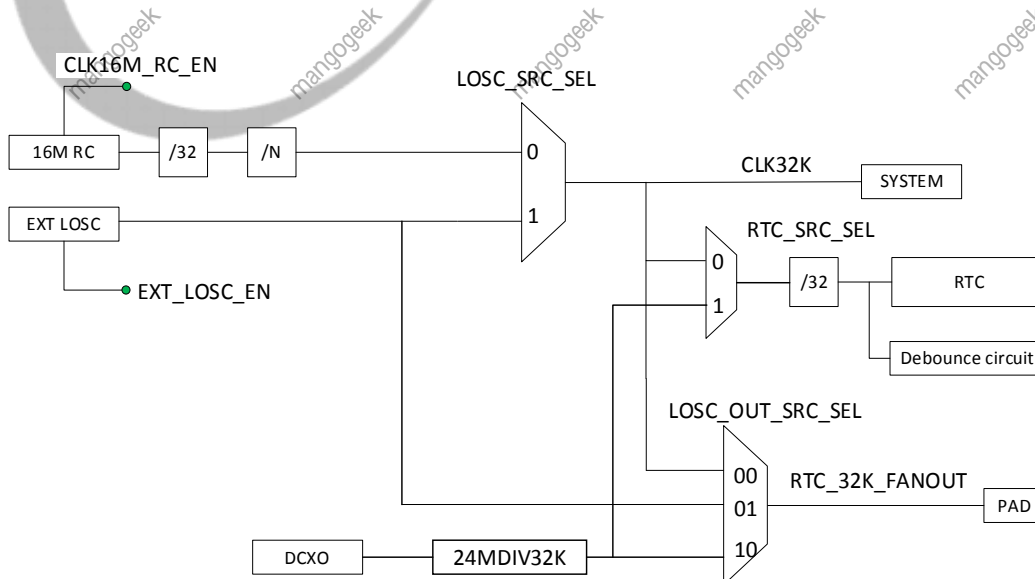

The NMI and alarm0 in common generate low level signal.

3.14.3.3 Clock Tree

The following figure shows the clock tree of the RTC.

Figure 3-43 RTC Clock Tree

- **LOSC**

The LOSC has 2 clock sources: internal RC, external low frequency crystal. The LOSC selects the internal RC by default, when the system starts, the LOSC can select by software the external low frequency crystal to provide much accurate clock. The clock accurate of the LOSC is related to the accurate of the external low frequency crystal. Usually select 32.768 kHz crystal with ± 20 ppm frequency tolerance. When using internal RC, the clock can be changed by changing division ratio. When using external clock, the clock cannot be changed.

- **RTC**

The clock sources of RTC can be selected by related switches, including 32K divided by internal 16 MHz RC, 32K divided by external DCXO, and external 32.768 kHz crystal.

- **System 32K**

The clock sources of system 32K are from external 32.768 kHz crystal and 32K divided by the internal 16 MHz RC.

- **RTC_32K_FANOUT**

The clock source of RTC_32K_FANOUT can select CLK32K, external 32.768 kHz crystal or 32K divided by external DCXO.

3.14.3.4 Real Time Clock

Figure 3-44 RTC Counter

The 1K counter adds 1 on each rising edge of the clock. When the clock number reaches 0x3FF, 1K counter starts to count again from 0, and the second counter adds 1. The step structure of 1 kHz counter is as follows.

Figure 3-45 RTC 1 kHz Counter Step Structure

According to above implementation, the changing range of each counter is as follows.

Table 3-18 RTC Counter Changing Range

| Counter | Range |
|---------|--|
| Second | 0 to 59 |
| Minute | 0 to 59 |
| Hour | 0 to 23 |
| Day | 0 to 65535 (The year, month, day need be transformed by software according to day counter) |

CAUTION

Because there is no error correction mechanism in the hardware, note that each counter configuration should not exceed a reasonable counting range.

3.14.3.5 Alarm 0

The principle of alarm0 is a comparator. When RTC timer reaches the scheduled time, the RTC generates the interrupt, or outputs low level signal by NMI pin to wakeup power management chip.

The RTC only generates one interrupt when RTC timer reached the scheduled day, hour, minute and second counter, then the RTC needs to be set a new scheduled time, the next interrupt can be generated.

3.14.3.6 Power-off Information Storage

The RTC provides eight 32-bit general purpose register to store power-off information.

Because VCC-RTC always holds non-power-off state after VCC-RTC cold starts, when the system is in shutdown or standby scene, the CPU can judge software process by the storing information.

3.14.3.7 RTC_VIO

The RTC module has a LDO, the input source of the LDO is VCC_RTC, the output of the LDO is RTC_VIO, the value of RTC_VIO is adjustable, the RTC_VIO is mainly used for internal digital logic.

3.14.3.8 RC Calibration Usage Scenario

- Power-on: Select non-accurate 32K divided by internal RC.
- Normal scenario: Select external accurate 32K, or external calibrated 32K.
- Standby or power-off scenario: Select external accurate 32K, or external calibrated 32K.

3.14.4 Programming Guidelines

3.14.4.1 RTC Clock Control

Step 1 Select clock source: Select clock source by the bit0 of [LOSC_CTRL_REG](#), the clock source is the internal RC oscillator by default. When the system starts, the clock source can be switched to the external 32K oscillator by software.

Step 2 Auto switch: After enabled the bit[15:14] of [LOSC_CTRL_REG](#), the RTC automatically switches clock source to the internal oscillator when the external crystal could not output waveform, the switch status can query by the bit[1] of [LOSC_AUTO_SWT_STA_REG](#).

NOTE

If only configuring the bit[15] of [LOSC_CTRL_REG](#), the clock source status bit cannot be changed after the auto switch is valid, because the two functions are independent.

Here is the basic code samples.

```
Write (0x16aa4000,LOSC_Ctrl); //Write key field
```

```
Write (0x16aa4001,LOSC_Ctrl); //Select the external 32K clock
```

3.14.4.2 RTC Calendar

Step 1 Write time initial value: Write the current time to [RTC_DAY_REG](#) and [RTC_HH_MM_SS_REG](#).

Step 2 After updated time, the RTC restarts to count again. The software can read the current time anytime.

NOTE

- The RTC can only provide day counter, so the current day counter need be converted to year, month, day and week by software.
- Ensure the bit[8:7] of LOSC_CTRL_REG is 0 before the next time configuration is performed.

Here is the basic code samples.

For example: set time to 21st, 07:08:09 and read it.

```
RTC_DAY_REG = 0x00000015;
```

```
RTC_HH_MM_SS_REG = 0x00070809; //0000 0000 000|0 0000(Hour) 00|00 0000(Minute) 00|00 0000(Second)
```

```
Read (RTC_DAY_REG);
```

```
Read (RTC_HH_MM_SS_REG);
```

3.14.4.3 Alarm0

Step 1 Enable alarm0 interrupt by writing [ALARM0_IRQ_EN](#).

Step 2 Set the counter comparator, write the count-down day, hour, minute, second number to [ALARM0_DAY_SET_REG](#) and [ALARM0_HH-MM-SS SET_REG](#).

Step 3 Enable alarm0 function by writing [ALARM0_ENABLE_REG](#), then the software can query alarm count value in real time by [ALARM0_DAY_SET_REG](#) and [ALARM0_HH-MM-SS SET_REG](#). When the setting time reaches, [ALARM0_IRQ_STA_REG](#) is set to 1 to generate interrupt.

Step 4 After enter the interrupt process, write [ALARM0_IRQ_STA_REG](#) to clear the interrupt pending, and execute the interrupt process.

Step 5 Resume the interrupt and continue to execute the interrupted process.

Step 6 The power-off wakeup is generated via SoC hardware and PMIC, the software only needs to set the pending condition of alarm0, and set [ALARM_CONFIG_REG](#) to 1.

Here is the basic code samples.

```

irq_request(GIC_SRC_R_Alarm0, Alm0_handler);
irq_enable(GIC_SRC_R_Alarm0);
writel(1, ALARM0_DAY_SET_REG);
writel(1, RTC_HH_MM_SS_REG); //set 1 second corresponding to normal mode;
writel(1, ALMO_EN);
writel(1, ALM_CONFIG); //NMI output
while(!readl(ALMO_IRQ_STA));
writel(1, ALMO_IRQ_EN);
while(readl(ALMO_IRQ_STA));
    
```

3.14.5 Register List

| Module Name | Base Address |
|-------------|--------------|
| RTC | 0x07090000 |

| Register Name | Offset | Description |
|--------------------------|-----------------|--|
| LOSC_CTRL_REG | 0x0000 | Low Oscillator Control Register |
| LOSC_AUTO_SWT_STA_REG | 0x0004 | LOSC Auto Switch Status Register |
| INTOSC_CLK_PRESCAL_REG | 0x0008 | Internal OSC Clock Pre-scalar Register |
| RTC_DAY_REG | 0x0010 | RTC Year-Month-Day Register |
| RTC_HH_MM_SS_REG | 0x0014 | RTC Hour-Minute-Second Register |
| ALARM0_DAY_SET_REG | 0x0020 | Alarm 0 Day Setting Register |
| ALARM0_CUR_VLU_REG | 0x0024 | Alarm 0 Counter Current Value Register |
| ALARM0_ENABLE_REG | 0x0028 | Alarm 0 Enable Register |
| ALARM0_IRQ_EN | 0x002C | Alarm 0 IRQ Enable Register |
| ALARM0_IRQ_STA_REG | 0x0030 | Alarm 0 IRQ Status Register |
| ALARM_CONFIG_REG | 0x0050 | Alarm Configuration Register |
| 32K_FOUT_CTRL_GATING_REG | 0x0060 | 32K Fanout Control Gating Register |
| GP_DATA_REG | 0x0100 + N*0x04 | General Purpose Register (N=0 to 7) |
| FBOOT_INFO_REG0 | 0x0120 | Fast Boot Information Register0 |
| FBOOT_INFO_REG1 | 0x0124 | Fast Boot Information Register1 |

| Register Name | Offset | Description |
|--------------------------|--------|--|
| DCXO_CTRL_REG | 0x0160 | DCXO Control Register |
| RTC_VIO_REG | 0x0190 | RTC_VIO Regulation Register |
| IC_CHARA_REG | 0x01F0 | IC Characteristic Register |
| VDD_OFF_GATING_CTRL_REG | 0x01F4 | VDD Off Gating Control Register |
| EFUSE_HV_PWRSWT_CTRL_REG | 0x0204 | Efuse High Voltage Power Switch Control Register |
| RTC_SPI_CLK_CTRL_REG | 0x0310 | RTC SPI Clock Control Register |

NOTE

The offset addresses less than 0x0300 are in VDD_RTC power domain, and the offset addresses large than or equal to 0x300 are in VDD_SYS power domain.

3.14.6 Register Description

3.14.6.1 0x0000 LOSC Control Register (Default Value: 0x0000_4010)

| Offset:0x0000 | | | Register Name: LOSC_CTRL_REG |
|---------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | W | 0x0 | KEY_FIELD Key Field This field should be filled with 0x16AA, and then the bit0 and bit1 can be written with the new value. |
| 15 | R/W | 0x0 | LOSC_AUTO_SWT_FUNCTION LOSC auto switch function disable 0: Enable 1: Disable |
| 14 | R/W | 0x1 | LOSC_AUTO_SWT_32K_SEL_EN LOSC auto switch 32K clk source select enable 0: Disable. When the losc losts, the 32k clk source will not change to RC 1: Enable. When the losc losts, the 32k clk source will change to RC (LOSC_SRC_SEL will be changed from 1 to 0) |
| 13:9 | / | / | / |
| 8 | R/W | 0x0 | RTC_HHMMSS_ACCE RTC Hour Minute Second access |

| Offset:0x0000 | | | Register Name: LOSC_CTRL_REG |
|---------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| | | | <p>After writing the RTC HH-MM-SS Register, this bit is set and it will be cleared until the real writing operation is finished.</p> <p>After writing the RTC HH-MM-SS Register, the RTC HH-MM-SS Register will be refreshed for at most one second.</p> <p>Note: Make sure that the bit is 0 for time configuration.</p> |
| 7 | R/W | 0x0 | <p>RTC_DAY_ACCE RTC DAY access</p> <p>After writing the RTC DAY register, this bit is set and it will be cleared until the real writing operation is finished.</p> <p>After writing the RTC DAY register, the DAY register will be refreshed for at most one second.</p> <p>Note: Make sure that the bit is 0 for time configuration.</p> |
| 6:5 | / | / | / |
| 4 | R/W | 0x1 | <p>EXT_LOSC_EN External 32.768 kHz Crystal Enable</p> <p>0: Disable 1: Enable</p> |
| 3:2 | R/W | 0x0 | <p>EXT_LOSC_GSM External 32.768 kHz Crystal GSM</p> <p>00: Low 01: / 10: / 11: High</p> <p>When GSM is changed, the 32K oscillation circuit will arise transient instability. If the autoswitch function (bit 15) is enabled, 32K changes to RC16M with certain probability. The GSM can influence the time of 32K starting oscillation, the more the GSM, the shorter the time of starting oscillation. So modifying GSM is not recommended.</p> <p>If you need to modify the GSM, firstly disable the auto switch function (bit 15), with a delay of 50 us, then change the GSM, the 32K clock source is changed to external clock.</p> |
| 1 | R/W | 0x0 | <p>RTC_SRC_SEL RTC_TIMER Clock Source Select</p> <p>0: LOSC_SRC 1: 24MDIV32K</p> <p>Before switching the bit, make sure that the 24MDIV32K function is enabled, that is, the bit16 of the 32K Fanout Control Register is 1.</p> |

| Offset:0x0000 | | | Register Name: LOSC_CTRL_REG |
|---------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 0 | R/W | 0x0 | LOSC_SRC_SEL LOSC Clock Source Select 0: Low frequency clock from 16M RC 1: External 32.768 kHz OSC |

NOTE

If the bit[8:7] of LOSC_CTRL_REG is set, the RTC HH-MM-SS, DD and ALARM DD-HH-MM-SS register cannot be written.

3.14.6.2 0x0004 LOSC Auto Switch Status Register (Default Value: 0x0000_0000)

| Offset:0x0004 | | | Register Name: LOSC_AUTO_SWT_STA_REG |
|---------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:3 | / | / | / |
| 2 | R | 0x0 | EXT_LOSC_STA Work only when the auto switch function is enabled. 0: External 32.768 kHz OSC work normally 1: External 32.768 kHz OSC work abnormally |
| 1 | R/W1C | 0x0 | LOSC_AUTO_SWT_PEND LOSC auto switch pending 0: No effect 1: Auto switch pending, it means LOSC_SRC_SEL is changed from 1 to 0. Setting 1 to this bit will clear it. |
| 0 | R | 0x0 | LOSC_SRC_SEL_STA Checking LOSC clock source status 0: Low frequency clock from 16M RC 1: External 32.768 kHz OSC |

3.14.6.3 0x0008 Internal OSC Clock Prescaler Register (Default Value: 0x0000_000F)

| Offset:0x0008 | | | Register Name: INTOSC_CLK_PRESCAL_REG |
|---------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:5 | / | / | / |
| 4:0 | R/W | 0xF | INTOSC_32K_CLK_PRESCAL Internal OSC 32K Clock Prescaler value N. The clock output = Internal RC/32/N. 00000: 1 00001: 2 00002: 3 11111: 32 |

3.14.6.4 0x0010 RTC Year-Month-DAY Register (Default Value: UDF)

| Offset:0x0010 | | | Register Name: RTC_DAY_REG |
|---------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15:0 | R/W | UDF | DAY Set Day Range from 0 to 65535. |

3.14.6.5 0x0014 RTC Hour-Minute-Second Register (Default Value: UDF)

| Offset:0x0014 | | | Register Name: RTC_HH_MM_SS_REG |
|---------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:21 | / | / | / |
| 20:16 | R/W | UDF | HOUR Set hour Range from 0 to 23. |
| 15:14 | / | / | / |
| 13:8 | R/W | UDF | MINUTE Set minute Range from 0 to 59. |
| 7:6 | / | / | / |
| 5:0 | R/W | UDF | SECOND |

| Offset:0x0014 | | | Register Name: RTC_HH_MM_SS_REG |
|---------------|------------|-------------|-----------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| | | | Set second Range from 0 to 59. |

3.14.6.6 0x0020 Alarm 0 Day Setting Register (Default Value: 0x0000_0000)

| Offset:0x0020 | | | Register Name: ALARM0_DAY_SET_REG |
|---------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15:0 | R/W | 0x0 | ALARM0_COUNTER Alarm 0 Counter is based on Day. |

3.14.6.7 0x0024 Alarm 0 Counter Current Value Register (Default Value: UDF)

| Offset:0x0024 | | | Register Name: ALARM0_CUR_VLU_REG |
|---------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:21 | / | / | / |
| 20:16 | R/W | UDF | HOUR Current hour Range from 0 to 23. |
| 15:14 | / | / | / |
| 13:8 | R/W | UDF | MINUTE Current minute Range from 0 to 59. |
| 7:6 | / | / | / |
| 5:0 | R/W | UDF | SECOND Current second Range from 0 to 59. |

3.14.6.8 0x0028 Alarm 0 Enable Register (Default Value: 0x0000_0000)

| Offset:0x0028 | | | Register Name: ALARM0_ENABLE_REG |
|---------------|------------|-------------|----------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:1 | / | / | / |
| 0 | R/W | 0x0 | ALM_0_EN |

| Offset:0x0028 | | | Register Name: ALARM0_ENABLE_REG |
|---------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| | | | Alarm 0 Enable 0: Disable 1: Enable |

3.14.6.9 0x002C Alarm 0 IRQ Enable Register (Default Value: 0x0000_0000)

| Offset:0x002C | | | Register Name: ALARM0_IRQ_EN |
|---------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:1 | / | / | / |
| 0 | R/W | 0x0 | ALARM0_IRQ_EN Alarm 0 IRQ Enable 0: Disable 1: Enable |

3.14.6.10 0x0030 Alarm 0 IRQ Status Register (Default Value: 0x0000_0000)

| Offset:0x0030 | | | Register Name: ALARM0_IRQ_STA_REG |
|---------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:1 | / | / | / |
| 0 | R/W1C | 0x0 | ALARM0_IRQ_PEND Alarm 0 IRQ Pending bit 0: No effect 1: Pending, alarm 0 counter value is reached If alarm 0 irq enable is set to 1, the pending bit will be sent to the interrupt controller. |

3.14.6.11 0x0050 Alarm Configuration Register (Default Value: 0x0000_0000)

| Offset:0x0050 | | | Register Name: ALARM_CONFIG_REG |
|---------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:1 | / | / | / |
| 0 | R/W | 0x0 | ALARM_WAKEUP Configuration of alarm wake up output. 0: Disable alarm wake up output |

| Offset:0x0050 | | | Register Name: ALARM_CONFIG_REG |
|---------------|------------|-------------|---------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| | | | 1: Enable alarm wake up output |

3.14.6.12 0x0060 32K Fanout Control Gating Register (Default Value: 0x0000_0000)

| Offset:0x0060 | | | Register Name: 32K_FOUT_CTRL_GATING_REG |
|---------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:17 | / | / | / |
| 16 | R/W | 0x0 | HOSC_TO_32K_DIVIDER_ENABLE HOSC to 32k divider enable 0: Disable the hosc 24M to 32K divider circuit 1: Enable the hosc 24M to 32K divider circuit |
| 15:3 | / | / | / |
| 2:1 | R/W | 0x0 | LOSC_OUT_SRC_SEL LOSC output source select 00: RTC_32K (select by RC_CLK_SRC_SEL & LOSC_SRC_SEL) 01: LOSC 10: HOSC divided 32K |
| 0 | R/W | 0x0 | 32K_FANOUT_GATING LOSC out gating enable Configuration of LOSC output, and there is no LOSC output by default. 0: Mask LOSC output gating 1: Enable LOSC output gating |

3.14.6.13 0x0100+N*0x0004 General Purpose Register (Default Value: 0x0000_0000)

| Offset:0x0100+N*0x0004 (N=0 to 7) | | | Register Name: GP_DATA_REGN |
|-----------------------------------|------------|-------------|-----------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | GP_DATA Data [31:0] |

NOTE

General purpose register 0 to 7 value can be stored if the RTC-VIO is larger than 0.7 V.

3.14.6.14 0x0120 Fast Boot Information Register0 (Default Value: 0x0000_0000)

| Offset:0x0120 | | | Register Name: FBOOT_INFO_REG0 |
|---------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | FBOOT_INFO0 Fast Boot info Fast Boot Information 0, refer to BROM spec. |

3.14.6.15 0x0124 Fast Boot Information Register1 (Default Value: 0x0000_0000)

| Offset:0x0124 | | | Register Name: FBOOT_INFO_REG1 |
|---------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | FBOOT_INFO1 Fast Boot info Fast Boot Information 1, refer to BROM spec. |

3.14.6.16 0x0160 DCXO Control Register (Default Value: 0x883F_10F7)

| Offset:0x0160 | | | Register Name: DCXO_CTRL_REG |
|---------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R/W | 0x1 | CLK_REQ_ENB Clock REQ enable 0: Enable DCXO wake up function 1: Disable DCXO wake up function |
| 30:28 | / | / | / |
| 27:24 | R/W | 0x8 | DCXO_ICTRL DCXO current control value |
| 23 | / | / | / |
| 22:16 | R/W | 0x3F | DCXO_TRIM DCXO cap array value The capacity cell is 55 fF. |
| 15:13 | / | / | / |
| 12:8 | R/W | 0x10 | DCXO_BG DCXO bandgap output voltage |
| 7 | R/W | 0x1 | DCXO_LDO_INRUSHB |

| Offset:0x0160 | | | Register Name: DCXO_CTRL_REG |
|---------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| | | | DCXO LDO driving capacity signal, active high |
| 6 | R/W | 0x1 | XTAL_MODE Xtal mode enable signal, active high 0: For external clk input mode 1: For normal mode |
| 5:4 | R/W | 0x3 | DCXO_RFCLK_ENHANCE DCXO rfclk enhance Enhance driving capacity of output OUT_RF_REFCLK, 0x0 for 5 pF, 0x1 for 10 pF, 0x2 for 15 pF, 0x3 for 20 pF. |
| 3 | / | / | / |
| 2 | R/W | 0x1 | RSTO_DLY_SEL For Debug Use Only. It cannot configure to 0 in normal state. |
| 1 | R/W | 0x1 | DCXO_EN DCXO enable 1: Enable 0: Disable |
| 0 | R/W | 0x1 | CLK16M_RC_EN 1: Enable 0: Disable The related register configuration is necessary to ensure the reset debounce circuit has a stable clock source. The first time SoC starts up, by default, the reset debounce circuit of SoC uses 32K divided by RC16M. In power-off, software reads the related bit to ensure whether EXT32K is working normally, if it is normal, first switch the clock source of debounce circuit to EXT32K, then close RC16M. Without EXT32K scenario or external RTC scenario, software confirms firstly whether EXT32K is working normally before switching, or software does not close RC16M. |

3.14.6.17 0x0190 RTC_VIO Regulation Register (Default Value: 0x0000_0004)

| Offset:0x0190 | | | Register Name:RTC_VIO_REG |
|---------------|------------|-------------|---------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:5 | / | / | / |
| 4 | R/W | 0x0 | V_SEL |

| Offset:0x0190 | | | Register Name:RTC_VIO_REG |
|---------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| | | | VDD Select 0: Resistance divider 1: Band gap |
| 3 | / | / | / |
| 2:0 | R/W | 0x4 | RTC_VIO_REGU RTC_VIO Voltage Select The RTC-VIO is provided power for RTC digital part. These bits are useful for regulating the RTC_VIO from 0.65 V to 1.3 V. 000: 1.0 V 001: 0.65 V (the configuration can cause RTC reset) 010: 0.7 V 011: 0.8 V 100: 0.9 V 101: 1.1 V 110: 1.2 V 111: 1.3 V |

3.14.6.18 0x01F0 IC Characteristic Register (Default Value: 0x0000_0000)

| Offset:0x01F0 | | | Register Name: IC_CHARA_REG |
|---------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | R/W | 0x0 | KEY_FIELD Key Field The field should be written as 0x16AA. Writing any other value in this field aborts the write-operation. |
| 15:0 | R/W | 0x0 | ID_DATA Return 0x16AA only if the KEY_FIELD is set as 0x16AA when read those bits, otherwise return 0x0. |

3.14.6.19 0x01F4 VDD Off Gating Control Register (Default Value: 0x0000_0021)

| Offset:0x01F4 | | | Register Name: VDD_OFF_GATING_CTRL_REG |
|---------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | W | 0x0 | KEY_FIELD Key Field |

| Offset:0x01F4 | | | Register Name: VDD_OFF_GATING_CTRL_REG |
|---------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| | | | This field should be filled with 0x16AA, and then the bit 15 can be configured. |
| 15 | WAC | 0x0 | PWROFF_GAT_RTC_CFG (For Debug Use Only) Power off gating control signal When use vdd_sys to RTC isolation software control, write this bit to 1. It will only be cleared by resetb release. |
| 14:12 | / | / | / |
| 11:4 | R/W | 0x2 | VCCIO_DET_SPARE Bit[7:5]: Reserved, default=0 Bit[4]: Bypass debounce circuit, default=0 Bit[3]: Enable control, default=0 0: Disable VCC-IO detection 1: Force the detection output Bit[2:0]: Gear adjustment 000: Detection threshold is 2.5 V 001: Detection threshold is 2.6 V 010: Detection threshold is 2.7 V (default) 011: Detection threshold is 2.8 V 100: Detection threshold is 2.9 V 101: Detection threshold is 3 V 110: N/A 111: N/A |
| 3:1 | / | / | / |
| 0 | R/W | 0x1 | VCCIO_DET_BYPASS_EN 0: not bypass 1: bypass |

3.14.6.20 0x0204 Efuse High Voltage Power Switch Control Register (Default Value: 0x0000_0000)

| Offset:0x0204 | | | Register Name: EFUSE_HV_PWRSWT_CTRL_REG |
|---------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:1 | / | / | / |
| 0 | R/W | 0x0 | EFUSE_1.8V_POWER_SWITCH_CONTROL 1: Open power switch 0: Close power switch |

3.14.6.21 0x0310 RTC SPI Clock Control Register (Default Value: 0x0000_0009)

| Offset:0x0310 | | | Register Name: RTC_SPI_CLK_CTRL_REG |
|---------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R/W | 0x0 | <p>RTC Reg CFG SPI Clock Gating</p> <p>0: Gating</p> <p>1: Not Gating</p> <p>Before configuring RTC register, the clock divider of SPI needs be configured firstly, then clock gating needs be enabled.</p> <p>Note: Frequency division and clock gating can not be set at the same time.</p> |
| 30:5 | / | / | / |
| 4:0 | R/W | 0x9 | <p>RTC Reg CFG SPI Clock Divider: M</p> <p>Actual SPI Clock = AHBS1/(M+1), (0 to 15)</p> <p>The default frequency of AHBS1 is 200 MHz, and the default frequency of SPI Clock is 20 MHz.</p> <p>Note: The SPI clock can not exceed 50 MHz, or else the RTC register may be abnormal.</p> |

4 Video and Graphics

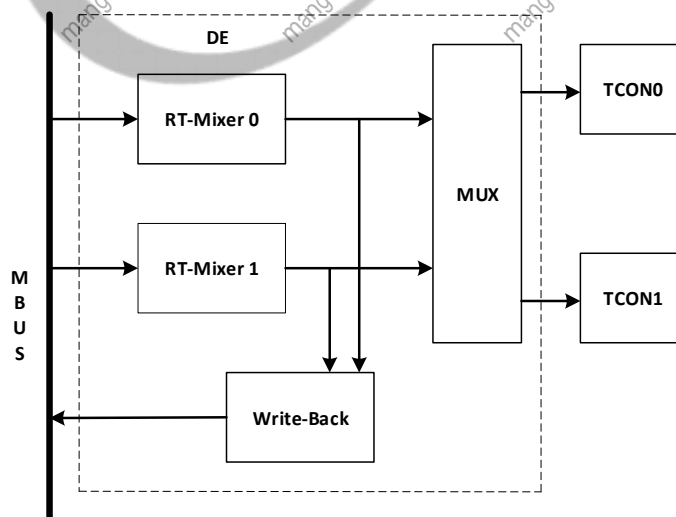

4.1 DE

The Display Engine (DE) is a hardware composer to transfer image layers from a local bus or a video buffer to the LCD interface. The DE supports four overlay windows to blend, and supports image post-processing in the video channel. The block diagram of DE is shown in Figure 4-1.

The DE has the following features:

- Output size up to 2048 x 2048
- Four alpha blending channels for main display, three channels for aux display
- Four overlay layers in each channel, and has a independent scaler
- Potter-duff compatible blending operation
- Support input format Semi-planar YUV422/YUV420/YUV411 and Planar YUV422/YUV420/YUV411, ARGB8888/XRGB8888/RGB888/ARGB4444/ARGB1555/RGB565/palette
- Supports SmartColor2.0 for excellent display experience
 - Adaptive detail/edge enhancement
 - Adaptive color enhancement
 - Adaptive contrast enhancement and fresh tone rectify
- Supports write back for aux display

Figure 4-1 DE Block Diagram

4.2 DI

The De-interlacer (DI) converts the interlaced input video frame to progressive video frame.

The DI has the following features:

- Supports YUV420 (Planar/NV12/NV21) and YUV422 (Planar/NV16/NV61) data format
- Supports video resolution from 32x32 to 2048x1280 pixel
- Supports Inter-field interpolation/motion adaptive de-interlace method
- Performance: module clock 600M for 1080p@60Hz YUV420

4.3 G2D

The Graphic 2D (G2D) engine is hardware accelerator for 2D graphic.

The G2D has the following features:

- Supports layer size up to 2048 x 2048 pixels
- Supports pre-multiplied alpha image data
- Supports color key
- Supports two pipes Porter-Duff alpha blending
- Supports multiple video formats 4:2:0, 4:2:2, 4:1:1 and multiple pixel formats (8/16/24/32 bits graphics layer)
- Supports memory scan order option
- Supports any format convert function
- Supports 1/16× to 32× resize ratio
- Supports 32-phase 8-tap horizontal anti-alias filter and 32-phase 4-tap vertical anti-alias filter
- Supports window clip
- Supports FillRectangle, BitBlit, StretchBlit and MaskBlit
- Supports horizontal and vertical flip, clockwise 0/90/180/270 degree rotate for normal buffer
- Supports horizontal flip, clockwise 0/90/270 degree rotate for LBC buffer

4.4 Video Decoding

4.4.1 Overview

The Video Decoding consists of Video Control Firmware (VCF) running on ARM processor and embedded hardware Video Engine (VE). VCF gets the bitstream from topper software, parses bitstream, invokes the Video Engine, and generates the decoding image sequence. The decoder image sequence is transmitted by the video output controller to the display device under the control of the topper software.

The Video Decoding has the following features:

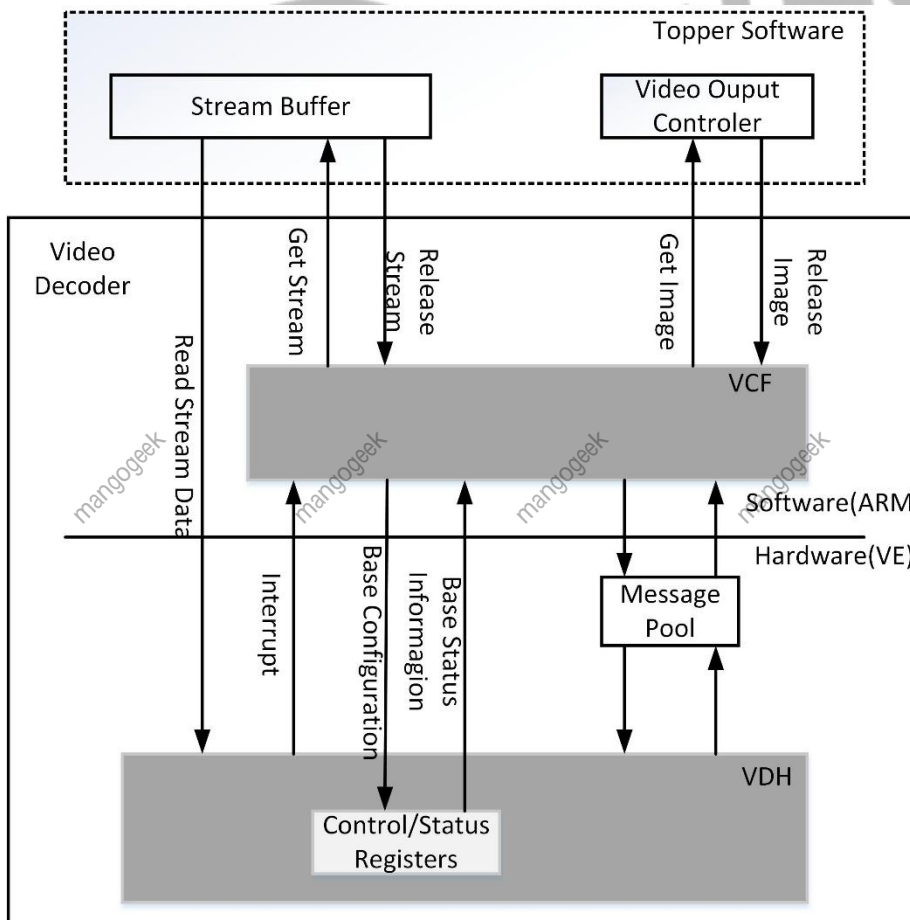

- Supports H.265 MP@L5.0
 - Maximum video resolution: 4096 x 2048
 - Maximum decoding rate: 100 Mbit/s, 4K@30fps or 1080p@60fps
- Supports H.264 BP/MP/HP@L5.0
 - Maximum video resolution: 4096 x 2048
 - Maximum decoding rate: 60 Mbit/s, 4K@24fps or 1080p@60fps
- Supports H.263 BP
 - Maximum video resolution: 1920 x 1080
 - Maximum decoding rate: 60 Mbit/s, 1080p@60fps
- Supports MPEG-4 SP/ASP L5
 - Maximum video resolution: 1920 x 1080
 - Maximum decoding rate: 60 Mbit/s, 1080p@60fps
- Supports MPEG-2 MP/HL
 - Maximum video resolution: 1920 x 1080
 - Maximum decoding rate: 60 Mbit/s, 1080p@60fps
- Supports MPEG-1 MP/HL
 - Maximum video resolution: 1920 x 1080
 - Maximum decoding rate: 60 Mbit/s, 1080p@60fps
- Supports Xvid
 - Maximum video resolution: 1920 x 1080
 - Maximum decoding rate: 60 Mbit/s, 1080p@60fps
- Supports Sorenson Spark

- Maximum video resolution: 1920 x 1080
- Maximum decoding rate: 60 Mbit/s, 1080p@60fps
- Supports WMV9/VC1 SP/MP/AP
 - Maximum video resolution: 1920 x 1080
 - Maximum decoding rate: 60 Mbit/s, 1080p@60fps
- Supports MJPEG
 - Maximum video resolution: 1920 x 1080
 - Maximum decoding rate: 60 Mbit/s, 1080p@30fps

4.4.2 Block Diagram

The functional block diagram of the Video Decoding is as follows.

Figure 4-2 Video Decoding Block Diagram

4.5 Video Encoding

4.5.1 Overview

The Video Encoding supports JPEG/MJPEG encoding (JPGE).

The JPGE is a high-performance JPEG encoder implemented by using hardware. It supports 64-megapixel snapshot or HD MJPEG encoding.

The JPGE has the following features:

- Supports ISO/IEC 10918-1 (CCITT T.81) baseline process (DCT sequential) encoding
- Encodes the pictures in the chrominance sampling format of YCbCr4:2:0 and YCbCr4:2:2
- Supports multiple input picture formats:
 - Semi-planar YCbCr4:2:0
 - Semi-planar YCbCr4:2:2
- Supports JPEG encoding with the performance of 1080p@60fps
- Supports configurable picture resolutions
 - Minimum picture resolution: 192 x 96
 - Maximum picture resolution: 4096 x 4096
- Supports the picture width or height step of 8
- Supports configurable quantization tables for the Y component, Cb component and Cr component respectively
- Supports OSD front-end overlapping
 - OSD overlaying before encoding for a maximum of 16 regions
 - OSD overlaying with any size and at any position (within the size and position range of the picture)
 - 16-level alpha blending
 - OSD overlaying control (enabled or disabled)
- Supports the color-to-gray function
- Supports the MJPEG output bit rate ranging from 2 kbit/s to 60 Mbit/s

4.5.2 Block Diagram

The functional block diagram of the JPGE is as follows.

Figure 4-3 JPGE Block Diagram

The JPGE realizes various protocol processing with large computation such as OSD, level shift, DCT, quantization, scanning, VLC encoding, and stream generation. The ARM software completes the encoding control processing such as quantization table configuration and interrupt processing.

Before the JPGE starts encoding, the software allocates two types of buffers mainly in the external DDR SDRAM:

- **Input picture buffer**

The JPGE reads the source pictures to be encoded from this buffer during encoding. This buffer is generally written by the Video Input Port module.

- **Stream buffer**

This buffer stores encoded streams. The JPGE writes streams to this buffer during encoding. This buffer is read by software.

5 Video Output Interfaces

5.1 TCON LCD

5.1.1 Overview

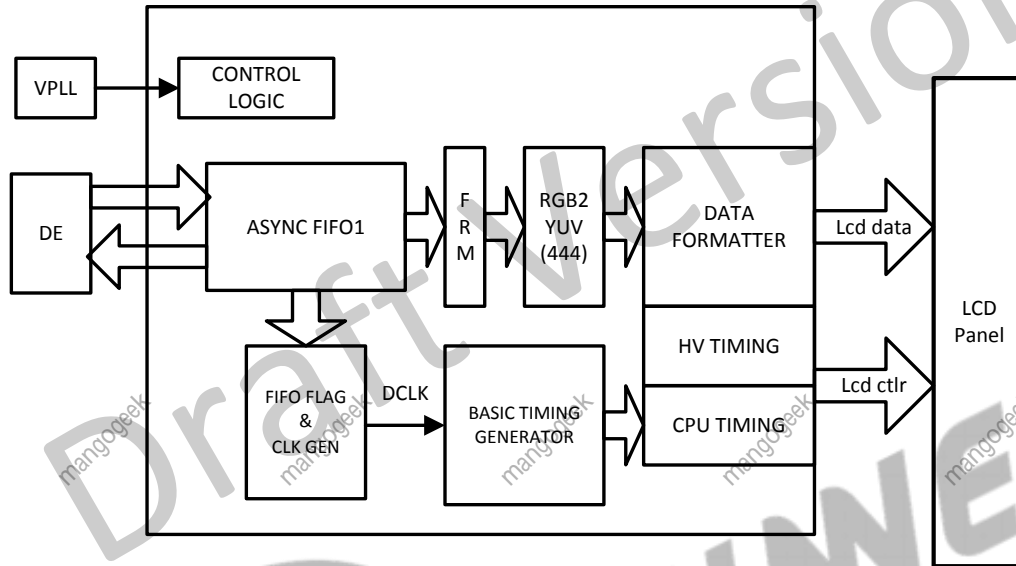

The Timing Controller_LCD (TCON_LCD) is a module that processes video signals received from system through a complicated arithmetic and then generates control signals and transmits them to the LCD panel driver IC.

The TCON_LCD includes the following features:

- Supports RGB interface with DE/SYNC mode, up to 1920x1080@60fps
- Supports serial RGB/dummy RGB interface, up to 800x480@60fps
- Supports LVDS interface with dual link, up to 1920x1080@60fps
- Supports LVDS interface with single link, up to 1366x768@60fps
- Supports i8080 interface, up to 800x480@60fps
- Supports BT656 interface for NTSC and PAL
- Supports RGB888, RGB666 and RGB565 with dither function
- Supports Gamma correction with R/G/B channel independence

5.1.2 Block Diagram

Figure 5-1 TCON_LCD Block Diagram

5.1.3 Functional Description

5.1.3.1 External Signals

The LCD external signals are used to connect to panel interface. The panel interface has various types.

Table 5-1 LCD External Signals

| Signal Name | Description | Type |
|---------------|--|------|
| LCDO-D[23:0] | LCD Data Output | O |
| LCDO-CLK | LCD Clock The pixel data are synchronized by this clock | O |
| LCDO-VSYNC | LCD Vertical Sync It indicates one new frame | O |
| LCDO-HSYNC | LCD Horizontal Sync It indicates one new scan line | O |
| LCDO-DE | LCD Data Output Enable | O |
| TCON-TRIG | LCD Sync (TCON outputs to LCD for sync) | O |
| LVDS0-CKP | LVDS0 Positive Port of Clock | O |
| LVDS0-CKN | LVDS0 Negative Port of Clock | O |
| LVDS0-V[3:0]P | LVDS0 Positive Port of Data Channel [3:0] | O |

| Signal Name | Description | Type |
|---------------|---|------|
| LVDS0-V[3:0]N | LVDS0 Negative Port of Data Channel [3:0] | O |
| LVDS1-CKP | LVDS1 Positive Port of Clock | O |
| LVDS1-CKN | LVDS1 Negative Port of Clock | O |
| LVDS1-V[3:0]P | LVDS1 Positive Port of Data Channel [3:0] | O |
| LVDS1-V[3:0]N | LVDS1 Negative Port of Data Channel [3:0] | O |

For parallel RGB, the data of LCD is high-aligned. The correspondence is as follows.

Table 5-2 The Correspondence between LCD and RGB

| LCD I/O | Parallel RGB I/O | | |
|----------|------------------|--------|--------|
| | RGB565 | RGB666 | RGB888 |
| LCD0-D23 | R4 | R5 | R7 |

| LCD0_CLK | IO2 | | DCLK | | | | WR | | | | | | | | | | | D3P2 | |

Figure 5-2 HV Interface Vertical Timing

Figure 5-3 HV Interface Horizontal Timing

5.1.3.4 BT656 Interface

In HV serial YUV output mode, its timing is BT656 compatible. SAV adds right before active area every line; EAV adds right after active area every line.

Table 5-5 BT656 Panel Signals

| Signal Name | Description | Type |
|-------------|--------------|------|
| DCLK | Clock signal | O |
| DATA[7:0] | Data signal | O |

Its logic is:

F = "0" for Field 1 F = "1" for Field 2

V = "1" during vertical blanking

H = "0" at SAV H = "1" at EAV

P3-P0 = protection bits

$$P3 = V \oplus H$$

$$P2 = F \oplus H$$

$$P1 = F \oplus V$$

$$P0 = F \oplus V \oplus H$$

Where \oplus represents the exclusive-OR function.

The 4 byte SAV/EAV sequence is as follows.

Table 5-6 EAV and SAV Sequence

| | 8-bit Data | | | | | | | 10-bit Data | | |
|--------------------|------------|----|----|----|----|----|----|-------------|----|----|
| | D9 (MSB) | D8 | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |
| Preamble | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Status word | 1 | F | V | H | P3 | P2 | P1 | P0 | 0 | 0 |

5.1.3.5 i8080 Interface

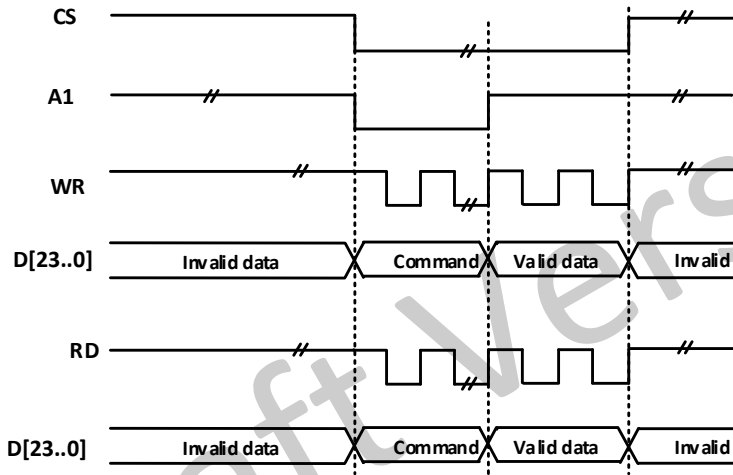

The i8080 I/F LCD panel is most common interface for small size, low resolution LCD panels. The CPU control signals are active low.

Table 5-7 CPU Panel Signals

| Signal Name | Description | Type |
|-------------|---|------|
| CS | Chip select, active low | O |
| WR | Write strobe, active low | O |
| RD | Read strobe, active low | O |
| A1 | Address bit, controlled by "LCD_CPU I/F" BIT26/25 | O |
| D[23..0] | Digital RGB output signal | I/O |

The following figure relationship between basic timing and CPU timing. WR is 180° delay of DCLK; CS is active when pixel data is valid; RD is always set to 1; A1 is set by "LCD_CPU I/F".

Figure 5-4 i8080 Interface Timing

When CPU I/F is in IDLE state, it can generate WR/RD timing by setting “Lcd_CPU I/F”. The CS strobe is one DCLK width, and the WR/RD strobe is half DCLK width.

5.1.3.6 LVDS Interface

Table 5-8 LVDS Panel Signals

| Signal Name | Description | Type |
|-------------|-------------------------------------|------|
| CKP | The positive port of clock | O |
| CKN | The negative port of clock | O |
| D0P | The positive port of data channel 0 | O |
| D0N | The negative port of data channel 0 | O |
| D1P | The positive port of data channel 1 | O |
| D1N | The negative port of data channel 1 | O |
| D2P | The positive port of data channel 2 | O |
| D2N | The negative port of data channel 2 | O |
| D3P | The positive port of data channel 3 | O |
| D3N | The negative port of data channel 3 | O |

The following figures show the timing of LVDS interface.

Figure 5-5 LVDS Single Link JEDIA Mode Interface Timing

Figure 5-6 LVDS Single Link NS Mode Interface Timing

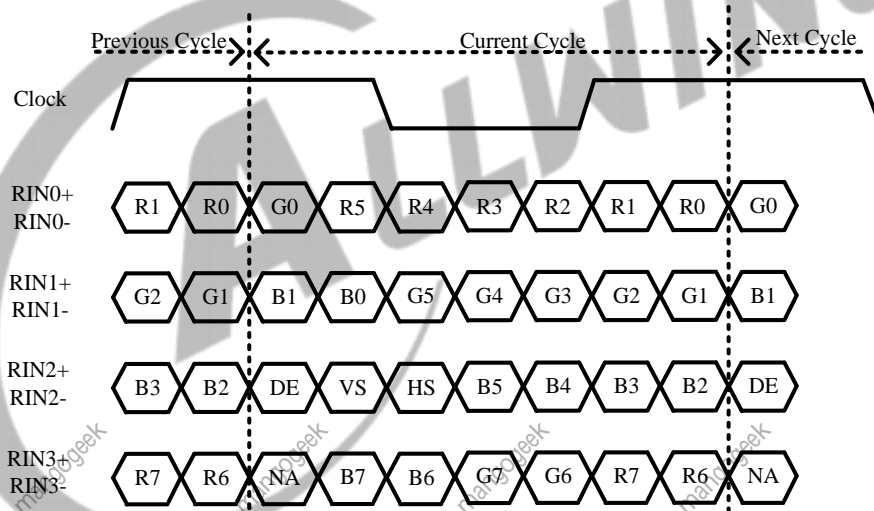

Figure 5-7 LVDS Dual Link NS Mode Interface Timing

5.1.3.7 Clock Sources

The following table describes the clock sources of TCON_LCD. Table 5-9 describes the clock sources of TCON_LCD.

Table 5-9 TCON_LCD Clock Sources

| Clock Sources | Description |
|----------------|---|
| PLL_VIDEO0(1X) | By default, PLL_VIDEO0(4X) is 1188 MHz, PLL_VIDEO0(1X) is 297 MHz |
| PLL_VIDEO0(4X) | |

| Clock Sources | Description |
|------------------|---|
| PLL_VIDEO1(1X) | By default, PLL_VIDEO1(4X) is 1188 MHz, PLL_VIDEO1(1X) is 297 MHz |
| PLL_VIDEO1(4X) | |
| PLL_PERI(2X) | By default, PLL_PERI(2X) is 1.2 GHz |
| PLL_AUDIO1(DIV2) | By default, PLL_AUDIO1 is 3072 MHz, PLL_AUDIO1(DIV2) is 1536 MHz |

5.1.3.8 RGB Gamma Correction

Function: This module correct the RGB input data of DE.

A 256*8*3 Byte register file is used to store the gamma table.

Table 5-10 RGB Gamma Correction Table

| Offset | Value |
|--------|-------------------------------------|
| 0x400 | { B0[7:0], G0[7:0], R0[7:0] } |
| 0x404 | { B1[7:0], G1[7:0], R1[7:0] } |
| | |
| 0x7FC | { B255[7:0], G255[7:0], R255[7:0] } |

5.1.3.9 CEU Module

This module enhances color data from DE .

$$R' = Rr * R + Rg * G + Rb * B + Rc$$

$$G' = Gr * R + Gg * G + Gb * B + Gc$$

$$B' = Br * R + Bg * G + Bb * B + Bc$$

Rr, Rg, Rb, Gr, Gg, Gb, Br, Bg, Bb s13 (-16, 16)

Rc, Gc, Bc s19 (-16384, 16384)

R, G, B u8 [0-255]

R' has the range of [Rmin ,Rmax]

G' has the range of [Rmin ,Rmax]

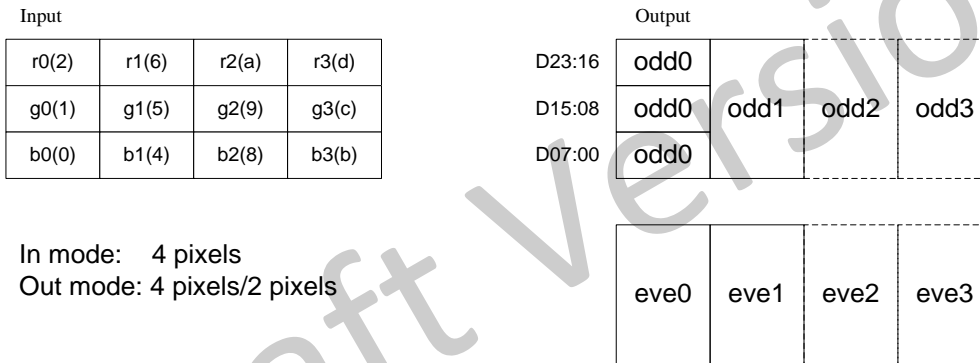

B' has the range of [Rmin ,Rmax]

5.1.3.10 CMAP Module

Function: This module map color data from DE.

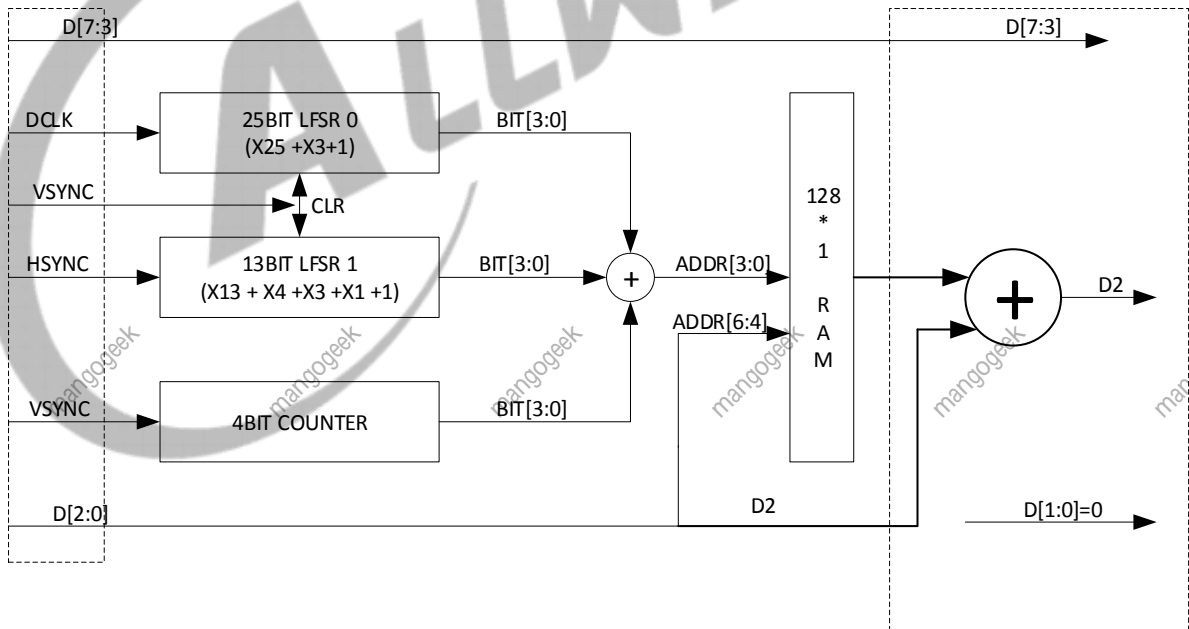

Every 4 input pixels are as a unit. A unit is divided into 12 bytes. Output byte can select one of those 12 bytes. Note that even line and odd line can be different, and output can be 12 bytes (4 pixels) or reduce to 6 bytes (2 pixels).

Figure 5-8 CMAP Module

5.1.3.11 FRM Module

Figure 5-9 FRM Module

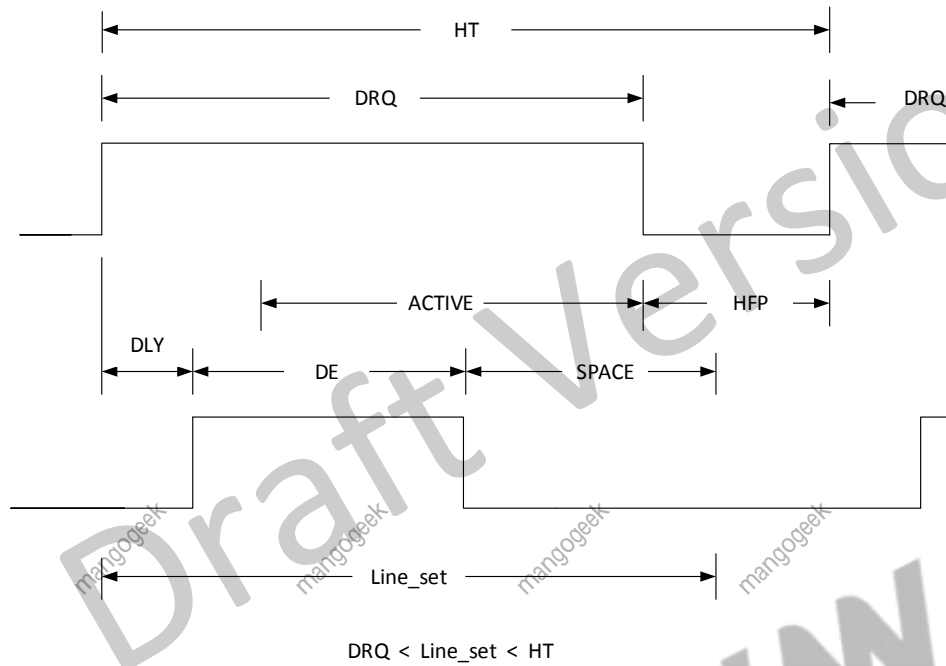

5.1.3.12 MIPI DSI

The requirements on MIPI DSI mode are as follows.

- (1). When using MIPI DSI as display interface, the data clk of TCON needs be started firstly.

(2). When it is used with DSI video mode, the setting of block space needs to meet the following relationship.

Figure 5-10 The Data Timing of MIPI DSI Video Mode

5.1.4 Programming Guidelines

5.1.4.1 HV Mode Configuration Process

Figure 5-11 HV Mode Initial Process

(1) Parallel RGB

Step 1 Select HV interface type

Configure LCD_CTL_REG[LCD_IF] (reg0x40) to 0 to select HV (Sync+DE) mode, and configure LCD_HV_IF_REG[HV_MODE] (reg0x58) to 0 to select 24bit/1cycle parallel mode.

```
lcd_dev[sel]->lcd_ctl.lcd_if = HV(Sync+DE);
```

```
lcd_dev[sel]->lcd_ctl.src_sel = src; //src = DE/color/grayscale/...
```

lcd_dev[sel]->lcd_hv_ctl.hv_mode = 24bit/1cycle parallel mode;

Step 2 Clock configuration

NOTE

- In parallel RGB mode, the displayed pixel clock (pixel_CLK) is required to be consistent with the DCLK, the pixel_clk(pixel_clk=Ht*Vt*frame rate) is decided by external LCD.
- When using phase adjustment function, the LCD_IO_POL_REG.DCLK_SEL (reg0x88) selects dclk0-2 of different phase, and LCD_IO_POL_REG.IO2_INV can achieve 180°phase delay.

Configure corresponding frequency by setting PLL_VIDEO0/1 register, and configure TCON LCD0 Clock register.

Configure internal frequency division of TCON_LCD. Based on clock source of TCON and DCLK, clock ratio, configure LCD_DCLK_REG[LCD_DCLK_DIV]. If using phase adjustment function, LCD_DCLK_REG[LCD_DCLK_EN] needs be set, usually is 0xf. When the dclk1 and dclk2 in LCD_DCLK_REG[LCD_DCLK_EN] are used, the value of LCD_DCLK_REG[LCD_DCLK_DIV] needs no less than 6.

lcd_dev[sel]->lcd_dclk.dclk_en = en;

lcd_dev[sel]->lcd_dclk.dclk_div = div;

Step 3 Set sequence parameters

The sequence parameters include x,ht,hbp,hspw,y,vt,vbp,vspw, and correspond to LCD_BASE_REG from reg0x48 to reg 0x54. Note that hbp includes hspw, and vbp includes vspw. And LCD_BASE2_REG.VT needs be set to the twice of the actual value.

lcd_dev[sel]->lcd_basic0.x = x-1;

lcd_dev[sel]->lcd_basic0.y = y-1;

lcd_dev[sel]->lcd_basic1.ht = ht-1;

lcd_dev[sel]->lcd_basic1.hbp = hbp-1;

lcd_dev[sel]->lcd_basic2.vt = vt*2;

lcd_dev[sel]->lcd_basic2.vbp = vbp-1;

lcd_dev[sel]->lcd_basic3.hspw = hspw-1;

lcd_dev[sel]->lcd_basic3.vspw = vspw-1;

Step 4 Open IO output

Set the corresponding data IO enable and control signal IO enable of LCD_IO_TRI_REG (reg0x8C) to 0 to start enable. Note that except the internal IO of TCON_LCD, the external GPIO mapping needs to be set to LCD mode.

When some control signals require polarity reversal, it can realize by setting LCD_IO_POL_REG.IO0~3_INV (reg0x88).

Step 5 Set and open interrupt function

The LCD_GINT0_REG (reg0x4) controls interrupt mode and flag, and the LCD_GINT1_REG (reg0x8) sets the interrupt line position of Line interrupt mode.

V interrupt:

lcd_dev[sel]->lcd_gint0.vb_en = 1;

Line interrupt:

lcd_dev[sel]->lcd_gint1.lcd_line_int_num = line;

lcd_dev[sel]->lcd_gint0.line_en = 1;

Step 6 Open module enable

Enable LCD_CTL_REG.LCD_EN (reg0x40) and LCD_GCTL_REG.LCD_EN (reg0x00).

lcd_dev[sel]->lcd_ctl.lcd_en = 1;

lcd_dev[sel]->lcd_gctl.lcd_en = 1;

(2) Serial RGB

The serial RGB mode is consistent with parallel RGB mode, the main difference is the definition of clock and the sequence of serial data. The difference is as follows.

Step 1 Select HV interface type

Set LCD_CTL_REG.LCD_IF (reg0x40) to 0 to select HV(Sync+DE) mode; set LCD_HV_IF_REG.HV_MODE (reg0x58) to select 8bit/3cycle RGB serial mode (RGB888), 8bit/4cycle Dummy RGB mode (DRGB) or 8bit/4cycle RGB Dummy mode (RGBD).

lcd_dev[sel]->lcd_ctl.lcd_if = HV(Sync+DE);

lcd_dev[sel]->lcd_ctl.src_sel = src; //src = DE/color/grayscale/...

lcd_dev[sel]->lcd_hv_ctl.hv_mode = Serial mode;

Step2、Step3: Set clock and sequence parameters

In serial RGB mode, DCLK is the transfer clock of each byte data. In the same resolution, pixel_clk of serial RGB is three times of its clock in parallel RGB, and ht,hbp,hspw own the same conversion

relation. When display is split into odd field and even field, LCD_BASE2_REG.VT needs not to be set to the twice of the actual value.

```
lcd_dev[sel]->lcd_basic2.vt = vt;
```

Set LCD_HV_IF_REG.RGB888_ODD_ORDER/LCD_HV_IF_REG.RGB888_ODD_EVEN to select RGB output sequence of the selected odd and even lines.

```
lcd_dev[lcd_sel]->lcd_hv_ctl.srgb_seq_even = seq_even;
```

```
lcd_dev[lcd_sel]->lcd_hv_ctl.srgb_seq_odd = seq_odd;
```

5.1.4.2 LVDS Mode Configuration Process

Figure 5-12 LVDS Mode Configuration Process

The LVDS interface configuration process is similar to the parallel mode of HV mode, and adds the digital/analog configuration of LVDS interface.

Step 1 Same as in step1 of parallel mode

Step 2 Clock configuration

NOTE

In parallel mode, the displayed pixel clock (pixel_CLK) is required to be consistent with the DCLK, $pixel_clk = Ht * Vt * frame\ rate$.

- Configure LCD_DCLK_REG.LCD_DCLK_DIV (reg0x44) to 7 after DCLK is determined;
- Configure the PLL clock in CCU based on proportional relationship;
- Release the LVDS reset of TCON LCD BUS GATING RESET register;
- Other configurations remain unchanged.

```
lcd_dev[sel]->lcd_dclk.dclk_en = en;
```

```
lcd_dev[sel]->lcd_dclk.dclk_div = 7;
```

Step 3 Same as in step3 of parallel mode

Step 4 Same as in step4 of parallel mode

Step 5 LVDS digital logic configuration

Includes clock source select of module, LVDS link number, data mode and bit width configuration.

- Configure LCD_LVDS_IF_REG.LCD_LVDS_CLK_SEL (reg0x84) to set LCD CLK;
- Configure LCD_LVDS_IF_REG.LCD_LVDS_LINK to set the required LVDS port number;
- Configure LCD_LVDS_IF_REG.LCD_LVDS_MODE to set JEDIA and NS mode;
- Configure LCD_LVDS_IF_REG.LCD_LVDS_BITWIDTH to select 24-bit or 18-bit width;
- Lastly configure LCD_LVDS_IF_REG.LCD_LVDS_EN to start LVDS mode.

lcd_dev[sel]->lcd_lvds_ctl.lvds_link = link_num-1;

lcd_dev[sel]->lcd_lvds_ctl.lvds_mode = mode;

lcd_dev[sel]->lcd_lvds_ctl.lvds_bitwidth = bitwidth;

lcd_dev[sel]->lcd_lvds_ctl.lvds_clk_sel = clk_src;

lcd_dev[sel]->lcd_lvds_ctl.lvds_en = 1;

NOTE

If configuring the same source data output mode of dual link, except the reg0x84 register of TCON_LCD0 needs be configured, the LCD_LVDS_IF_REG.LCD_LVDS_CLK_SEL, LCD_LVDS_IF_REG.LCD_LVDS_LINK, LCD_LVDS_IF_REG.LCD_LVDS_MODE, and LCD_LVDS_IF_REG.LCD_LVDS_BITWIDTH of the reg0x244 register need be configured.

Step 6 LVDS controller configuration

NOTE

The TCON LCD0 PHY0 is controlled by COMBO_PHY_REG (reg0x1110, reg0x1114). The TCON LCD0 PHY1 is controlled by LCD_LVDS0_ANA_REG (reg0x220).

For PHY0:

- Configure the reg_verf1p6 (differential mode voltage) in reg0x1114 to 4;

- Configure the reg_vref0p8 reg0x1114 (common mode voltage) in reg0x1114 to 3;
- Start en_cp, en_mipi, en_lvds, and en_comboldo in reg0x1110, in turn.

For PHY1:

The LVDS analog configuration process is to start clock and data channel, and set the common mode and differential mode voltage, and start module power.

- Configure LVDS_HPREN_DRVC and LVDS_HPREN_DRV. When LVDS signal is 18-bit, LVDS_HPREN_DRV=0x7; when LVDS signal is 24-bit, LVDS_HPREN_DRV=0xF;
- Configure LVDS0_REG_C (differential mode voltage) to 4;
- Configure LVDS0_REG_V (common mode voltage) to 3;
- Lastly, start module voltage, and enable EN_LVDS and EN_24M.

NOTE

When the same source data output of dual link needs be configured, then the LVDS_DUAL_CHANNEL_SRC_SEL needs be configured to 1.

```
lcd_dev[sel]->lcd_lvds_ana_ctl[lvds_num].bits.en_drvd = 0x7; //18-bit=0x7, 24-bit=0xf
```

```
lcd_dev[sel]->lcd_lvds_ana_ctl[lvds_num].bits.en_drvc = 1;
```

```
lcd_dev[sel]->lcd_lvds_ana_ctl[lvds_num].bits.diff_level = diff;
```

```
lcd_dev[sel]->lcd_lvds_ana_ctl[lvds_num].bits.com_level = com;
```

```
lcd_dev[sel]->lcd_lvds_ana_ctl[lvds_num].bits.dual_src = link_src;
```

```
lcd_dev[sel]->lcd_lvds_ana_ctl[lvds_num].bits.en_24M = 1;
```

```
lcd_dev[sel]->lcd_lvds_ana_ctl[lvds_num].bits.en_lvds = 1;
```

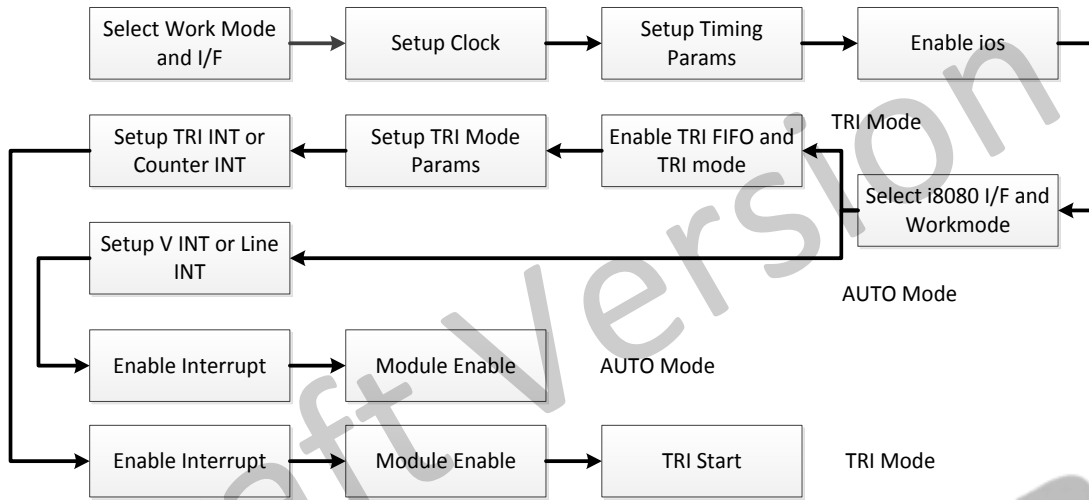

```
lcd_dev[sel]->lcd_lvds_ana_ctl[lvds_num].bits.en_mb = 1;
```

Step 7 Same as in step5 of parallel mode

Step 8 Same as in step6 of parallel mode

5.1.4.3 i8080 Mode Configuration Process

Figure 5-13 i8080 Mode Initial Process

Step 1 Select i8080 interface type.

Step 2 The step is the same as HV mode, but pulse adjustment function is invalid.

Step 3 The step is the same as HV mode. When using TRI mode, it is best to configure LCD timing parameters in HV mode, or a handful of functions such as CMAP will not be able to apply.

Step 4 The step is the same as HV mode.

Step 5 Select type and operating mode of i8080, the operating mode includes TRI mode and AUTO mode, and the two operating modes are different.

-----**If For TRI mode**-----

Step 6 Open TRI FIFO switch, and TRI mode function.

Step 7 Set parameters of TRI mode, including block size, block space and block number.

NOTE

When output interface is parallel mode, then the setting value of block space parameter is not less than 20.

When output interface is 2 cycle serial mode, then the setting value of block space parameter is not less than 40.

When output interface is 3 cycle serial mode, then the setting value of block space parameter is not less than 60.

When output interface is 4 cycle serial mode, then the setting value of block space parameter is not less than 80.

Step 8 Set the tri interrupt or counter interrupt. When using the two interrupts, mainly in the interrupt service function the tri start operation need be operated (the bit1 of LCD_CPU_IF_REG is set to "1"). If using TE trigger interrupt, you select the external input pin as a trigger signal, the 24-bit for offset 0x8C register is set to "1", to open up input of pad.

Step 9 Open the total switch of interrupt.

Step 10 Open the total enable of interrupt.

Step 11 Operate "tri start" operation (the bit1 of LCD_CPU_IF_REG is set to "1").

If For Auto mode

Step 6 Set and open V interrupt or Line interrupt, the step is the same as HV mode.

Step 7 Open module total enable.

5.1.5 Register List

| Module Name | Base Address |
|-------------|--------------|
| TCON_LCD0 | 0x05461000 |

| Register Name | Offset | Description |
|------------------|---------------|---------------------------------------|
| LCD_GCTL_REG | 0x0000 | LCD Global Control Register |
| LCD_GINT0_REG | 0x0004 | LCD Global Interrupt Register0 |
| LCD_GINT1_REG | 0x0008 | LCD Global Interrupt Register1 |
| LCD_FRM_CTL_REG | 0x0010 | LCD FRM Control Register |
| LCD_FRM_SEED_REG | 0x0014+N*0x04 | LCD FRM Seed Register (N=0,1,2,3,4,5) |
| LCD_FRM_TAB_REG | 0x002C+N*0x04 | LCD FRM Table Register (N=0,1,2,3) |
| LCD_3D_FIFO_REG | 0x003C | LCD 3D FIFO Register |
| LCD_CTL_REG | 0x0040 | LCD Control Register |
| LCD_DCLK_REG | 0x0044 | LCD Data Clock Register |
| LCD_BASIC0_REG | 0x0048 | LCD Basic Timing Register0 |
| LCD_BASIC1_REG | 0x004C | LCD Basic Timing Register1 |
| LCD_BASIC2_REG | 0x0050 | LCD Basic Timing Register2 |
| LCD_BASIC3_REG | 0x0054 | LCD Basic Timing Register3 |
| LCD_HV_IF_REG | 0x0058 | LCD HV Panel Interface Register |
| LCD_CPU_IF_REG | 0x0060 | LCD CPU Panel Interface Register |
| LCD_CPU_WR_REG | 0x0064 | LCD CPU Panel Write Data Register |

| Register Name | Offset | Description |
|------------------------|---------------|---|
| LCD_CPU_RDO_REG | 0x0068 | LCD CPU Panel Read Data Register0 |
| LCD_CPU_RD1_REG | 0x006C | LCD CPU Panel Read Data Register1 |
| LCD_LVDS_IF_REG | 0x0084 | LCD LVDS Configure Register |
| LCD_IO_POL_REG | 0x0088 | LCD IO Polarity Register |
| LCD_IO_TRI_REG | 0x008C | LCD IO Control Register |
| LCD_DEBUG_REG | 0x00FC | LCD Debug Register |
| LCD_CEU_CTL_REG | 0x0100 | LCD CEU Control Register |
| LCD_CEU_COEF_MUL_REG | 0x0110+N*0x04 | LCD CEU Coefficient Register0 (N=0-10) |
| LCD_CEU_COEF_ADD_REG | 0x011C+N*0x10 | LCD CEU Coefficient Register1 (N=0,1,2) |
| LCD_CEU_COEF_RANG_REG | 0x0140+N*0x04 | LCD CEU Coefficient Register2 (N=0,1,2) |
| LCD_CPU_TRI0_REG | 0x0160 | LCD CPU Panel Trigger Register0 |
| LCD_CPU_TRI1_REG | 0x0164 | LCD CPU Panel Trigger Register1 |
| LCD_CPU_TRI2_REG | 0x0168 | LCD CPU Panel Trigger Register2 |
| LCD_CPU_TRI3_REG | 0x016C | LCD CPU Panel Trigger Register3 |
| LCD_CPU_TRI4_REG | 0x0170 | LCD CPU Panel Trigger Register4 |
| LCD_CPU_TRI5_REG | 0x0174 | LCD CPU Panel Trigger Register5 |
| LCD_CMAP_CTL_REG | 0x0180 | LCD Color Map Control Register |
| LCD_CMAP_ODD0_REG | 0x0190 | LCD Color Map Odd Line Register0 |
| LCD_CMAP_ODD1_REG | 0x0194 | LCD Color Map Odd Line Register1 |
| LCD_CMAP_EVEN0_REG | 0x0198 | LCD Color Map Even Line Register0 |
| LCD_CMAP_EVEN1_REG | 0x019C | LCD Color Map Even Line Register1 |
| LCD_SAFE_PERIOD_REG | 0x01F0 | LCD Safe Period Register |
| LCD_LVDS0_ANA_REG | 0x0220 | LCD LVDS Analog Register 0 |
| LCD_LVDS1_ANA_REG | 0x0224 | LCD LVDS Analog Register 1 |
| LCD_SYNC_CTL_REG | 0x0230 | LCD Sync Control Register |
| LCD_SYNC_POS_REG | 0x0234 | LCD Sync Position Register |
| LCD_SLAVE_STOP_POS_REG | 0x0238 | LCD Slave Stop Position Register |
| LCD_LVDS1_IF_REG | 0x0244 | LCD LVDS1 IF Register |
| LCD_GAMMA_TABLE_REG | 0x0400-0x07FF | LCD Gamma Table Register |

5.1.6 Register Description

5.1.6.1 0x0000 LCD Global Control Register (Default Value: 0x0000_0000)

| Offset: 0x0000 | | | Register Name: LCD_GCTL_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R/W | 0x0 | LCD_EN When it is disabled, the module will be reset to idle state. 0: Disable 1: Enable |
| 30 | R/W | 0x0 | LCD_GAMMA_EN Enable the Gamma correction function. 0: Disable 1: Enable |
| 29:0 | / | / | / |

5.1.6.2 0x0004 LCD Global Interrupt Register0 (Default Value: 0x0000_0000)

| Offset: 0x0004 | | | Register Name: LCD_GINT0_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R/W | 0x0 | LCD_VB_INT_EN Enable the Vb interrupt 0: Disable 1: Enable |
| 30 | / | / | / |
| 29 | R/W | 0x0 | LCD_LINE_INT_EN Enable the line interrupt 0: Disable 1: Enable |
| 28 | / | / | / |
| 27 | R/W | 0x0 | LCD_TRI_FINISH_INT_EN Enable the trigger finish interrupt 0: Disable 1: Enable |
| 26 | R/W | 0x0 | LCD_TRI_COUNTER_INT_EN Enable the trigger counter interrupt 0: Disable 1: Enable |
| 25:16 | / | / | / |

| Offset: 0x0004 | | | Register Name: LCD_GINT0_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 15 | R/WOC | 0x0 | LCD_VB_INT_FLAG Asserted during vertical no-display period every frame Write 0 to clear it. |
| 14 | / | / | / |
| 13 | R/WOC | 0x0 | LCD_LINE_INT_FLAG Trigger when SY0 match the current LCD scan line Write 0 to clear it. |
| 12 | / | / | / |
| 11 | R/WOC | 0x0 | LCD_TRI_FINISH_INT_FLAG Trigger when cpu trigger mode finished Write 0 to clear it. |
| 10 | R/WOC | 0x0 | LCD_TRI_COUNTER_INT_FLAG Trigger when tri counter reaches this value Write 0 to clear it. |
| 9 | R/WOC | 0x0 | LCD_TRI_UNDERFLOW_FLAG Only used in dsi video mode, tri when sync by dsi but not finish Write 0 to clear it. |
| 8:3 | / | / | / |
| 2 | R/WOC | 0x0 | FSYNC_INT_INV Enable the fsync interrupt to set signal inverse polarity. When FSYNC is positive, this bit must be 1. And vice versa. |
| 1 | R/WOC | 0x0 | DE_INT_FLAG Asserted at the first valid line in every frame Write 0 to clear it. |
| 0 | R/WOC | 0x0 | FSYNC_INT_FLAG Asserted at the fsync signal in every frame Write 0 to clear it. |

5.1.6.3 0x0008 LCD Global Interrupt Register1 (Default Value: 0x0000_0000)

| Offset: 0x0008 | | | Register Name: LCD_GINT1_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:28 | / | / | / |
| 27:16 | R/W | 0x0 | LCD_LINE_INT_NUM Scan line for LCD line trigger (including inactive lines). Setting it for the specified line for trigger0. Note: SY0 is writable only when LINE_TRG0 is disabled. |
| 15:0 | / | / | / |

5.1.6.4 0x0010 LCD FRM Control Register (Default Value: 0x0000_0000)

| Offset: 0x0010 | | | Register Name: LCD_FRM_CTL_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R/W | 0x0 | LCD_FRM_EN Enable the dither function 0: Disable 1: Enable |
| 30:7 | / | / | / |
| 6 | R/W | 0x0 | LCD_FRM_MODE_R The R component output bits in dither function 0: 6-bit frm output 1: 5-bit frm output |
| 5 | R/W | 0x0 | LCD_FRM_MODE_G The G component output bits in dither function 0: 6-bit frm output 1: 5-bit frm output |
| 4 | R/W | 0x0 | LCD_Frm_MODE_B The B component output bits in dither function 0: 6-bit frm output 1: 5-bit frm output |
| 3:2 | / | / | / |
| 1:0 | R/W | 0x0 | LCD_FRM_TEST Set the test mode of dither function 00: FRM 01: Half 5-/6-bit, half FRM 10: Half 8-bit, half FRM 11: Half 8-bit, half 5-/6-bit |

5.1.6.5 0x0014+ N*0x04 (N=0-5) LCD FRM Seed Register (Default Value: 0x0000_0000)

| Offset: 0x0014+N*0x04 (N=0-5) | | | Register Name: |
|-------------------------------|------------|-------------|----------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:25 | / | / | / |

| Offset: 0x0014+N*0x04 (N=0-5) | | | Register Name: |
|-------------------------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 24:0 | R/W | 0x0 | SEED_VALUE Set the seed used in dither function N=0: Pixel_Seed_R N=1: Pixel_Seed_G N=2: Pixel_Seed_B N=3: Line_Seed_R N=4: Line_Seed_G N=5: Line_Seed_B Note: Avoid setting it to 0. |

5.1.6.6 0x002C+ N*0x04 (N=0-3) LCD FRM Table Register (Default Value: 0x0000_0000)

| Offset: 0x002C+N*0x04 (N=0-3) | | | Register Name: LCD_FRM_TAB_REG |
|-------------------------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | FRM_TABLE_VALUE Set the data used in dither function Usually set as follows: Table0 = 0x01010000 Table1 = 0x15151111 Table2 = 0x57575555 Table3 = 0x7f7f7777 |

5.1.6.7 0x003C LCD 3D FIFO Register (Default Value: 0x0000_0000)

| Offset: 0x003C | | | Register Name: LCD_3D_FIFO_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R/W | 0x0 | 3D_FIFO_BIST_EN Enable the 3D fifo bist test function 0: Disable 1: Enable |
| 30:14 | / | / | / |
| 13:4 | R/W | 0x0 | 3D_FIFO_HALF_LINE_SIZE The number of data in half line=3D_FIFO_HALF_LINE_SIZE+1, only valid when 3D_FIFO_SETTING is set as 2. |
| 3:2 | / | / | / |

| Offset: 0x003C | | | Register Name: LCD_3D_FIFO_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 1:0 | R/W | 0x0 | 3D_FIFO_SETTING Set the work mode of 3D FIFO 00: Bypass 01: Used as normal FIFO 10: Used as 3D interlace FIFO 11: Reserved |

5.1.6.8 0x0040 LCD Control Register (Default Value: 0x0000_0000)

| Offset: 0x0040 | | | Register Name: LCD_CTL_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R/W | 0x0 | LCD_EN It executes at the beginning of the first blank line of LCD timing. 0: Disable 1: Enable |
| 30:26 | / | / | / |
| 25:24 | R/W | 0x0 | LCD_IF Set the interface type of LCD controller. 00: HV(Sync+DE) 01: 8080 I/F 1x: Reserved |
| 23 | R/W | 0x0 | LCD_RB_SWAP Enable the function to swap red data and blue data in fifo1. 0: Default 1: Swap RED and BLUE data at FIFO1 |
| 22 | / | / | / |
| 21 | R/W | 0x0 | LCD_FIFO1_RST Writing 1 and then 0 to this bit will reset FIFO 1 Note: 1 holding time must more than 1 DCLK |
| 20 | R/W | 0x0 | LCD_INTERLACE_EN This flag is valid only when LCD_EN == 1 0: Disable 1: Enable |
| 19:9 | / | / | / |
| 8:4 | R/W | 0x0 | LCD_START_DLY The unit of delay is T _{line} . Note: Valid only when LCD_EN == 1 |
| 3 | / | / | / |

| Offset: 0x0040 | | | Register Name: LCD_CTL_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 2:0 | R/W | 0x0 | LCD_SRC_SEL LCD Source Select 000: DE 001: Color Check 010: Grayscale Check 011: Black by White Check 100: Test Data all 0 101: Test Data all 1 110: Reversed 111: Gridding Check |

5.1.6.9 0x0044 LCD Data Clock Register (Default Value: 0x0000_0000)

| Offset: 0x0044 | | | Register Name: LCD_DCLK_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:28 | R/W | 0x0 | LCD_DCLK_EN LCD clock enable 0000: dclk_en = 0; dclk1_en = 0; dclk2_en = 0; dclkm2_en = 0; 0001: dclk_en = 1; dclk1_en = 0; dclk2_en = 0; dclkm2_en = 0; 0010: dclk_en = 1; dclk1_en = 0; dclk2_en = 0; dclkm2_en = 1; 0011: dclk_en = 1; dclk1_en = 1; dclk2_en = 0; dclkm2_en = 0; 0101: dclk_en = 1; dclk1_en = 0; dclk2_en = 1; dclkm2_en = 0; 1111: dclk_en = 1; dclk1_en = 1; dclk2_en = 1; dclkm2_en = 1; Others:Reversed |
| 27:7 | / | / | / |
| 6:0 | R/W | 0x0 | LCD_DCLK_DIV Tdclk = Tsclk/DCLKDIV Note: 1.If dclk1&dclk2 are used, DCLKDIV >=6 2.If only dclk is used, DCLKDIV >=1 |

5.1.6.10 0x0048 LCD Basic Timing Register0 (Default Value: 0x0000_0000)

| Offset: 0x0048 | | | Register Name: LCD_BASIC0_REG |
|----------------|------------|-------------|-------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:28 | / | / | / |
| 27:16 | R/W | 0x0 | WIDTH_X Panel width is X+1 |

| Offset: 0x0048 | | | Register Name: LCD_BASIC0_REG |
|----------------|------------|-------------|---------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 15:12 | / | / | / |
| 11:0 | R/W | 0x0 | HEIGHT_Y Panel height is Y+1 |

5.1.6.11 0x004C LCD Basic Timing Register1 (Default Value: 0x0000_0000)

| Offset: 0x004C | | | Register Name: LCD_BASIC1_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:29 | / | / | / |
| 28:16 | R/W | 0x0 | HT $T_{cycle} = (HT+1) * T_{dclk}$ Computation: 1) parallel: $HT = X + BLANK$ Limitation: 1) parallel: $HT \geq (HBP + 1) + (X+1) + 2$ 2) serial 1: $HT \geq (HBP + 1) + (X+1) * 3 + 2$ 3) serial 2: $HT \geq (HBP + 1) + (X+1) * 3 / 2 + 2$ |
| 15:12 | / | / | / |
| 11:0 | R/W | 0x0 | HBP Horizontal back porch (in dclk) $T_{hbp} = (HBP + 1) * T_{dclk}$ |

5.1.6.12 0x0050 LCD Basic Timing Register2 (Default Value: 0x0000_0000)

| Offset: 0x0050 | | | Register Name: LCD_BASIC2_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:29 | / | / | / |
| 28:16 | R/W | 0x0 | VT $T_{VT} = (VT)/2 * T_{hsync}$ $VT/2 \geq (VBP+1) + (Y+1) + 2$ |
| 15:12 | / | / | / |
| 11:0 | R/W | 0x0 | VBP $T_{vbp} = (VBP + 1) * T_{hsync}$ |

5.1.6.13 0x0054 LCD Basic Timing Register3 (Default Value: 0x0000_0000)

| Offset: 0x0054 | | | Register Name: LCD_BASIC3_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:26 | / | / | / |
| 25:16 | R/W | 0x0 | HSPW Thspw = (HSPW+1) * Tdclk HT > (HSPW+1) |
| 15:10 | / | / | / |
| 9:0 | R/W | 0x0 | VSPW Tvspw = (VSPW+1) * Thsync VT/2 > (VSPW+1) |

5.1.6.14 0x0058 LCD HV Panel Interface Register (Default Value: 0x0000_0000)

| Offset: 0x0058 | | | Register Name: LCD_HV_IF_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:28 | R/W | 0x0 | HV_MODE Set the HV mode of LCD controller 0000: 24-bit/1-cycle parallel mode 1000: 8-bit/3-cycle RGB serial mode (RGB888) 1010: 8-bit/4-cycle Dummy RGB (DRGB) 1011: 8-bit/4-cycle RGB Dummy (RGBD) 1100: 8-bit/2-cycle YUV serial mode (CCIR656) |
| 27:26 | R/W | 0x0 | RGB888_ODD_ORDER Serial RGB888 mode Output sequence at odd lines of the panel (line 1, 3, 5, 7...). 00: R→G→B 01: B→R→G 10: G→B→R 11: R→G→B |
| 25:24 | R/W | 0x0 | RGB888_EVEN_ORDER Serial RGB888 mode Output sequence at even lines of the panel (line 2, 4, 6, 8...). 00: R→G→B 01: B→R→G 10: G→B→R 11: R→G→B |

| Offset: 0x0058 | | | Register Name: LCD_HV_IF_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 23:22 | R/W | 0x0 | YUV_SM Serial YUV mode Output sequence 2-pixel-pair of every scan line. 00: YUYV 01: YVYU 10: UYVY 11: VYUY |
| 21:20 | R/W | 0x0 | YUV_EAV_SAV_F_LINE_DLY Set the delay line mode. 00: F toggle right after active video line 01: delay 2 line (CCIR PAL) 10: delay 3 line (CCIR NTSC) 11: reserved |
| 19 | R/W | 0x0 | CCIR_CSC_DIS LCD convert source from RGB to YUV. 0: Enable 1: Disable Only valid when HV mode is "1100". |
| 18:0 | / | / | / |

5.1.6.15 0x0060 LCD CPU Panel Interface Register (Default Value: 0x0000_0000)

| Offset: 0x0060 | | | Register Name: LCD_CPU_IF_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:28 | R/W | 0x0 | CPU_MODE Set the cpu interface work mode 0000: 18-bit/256K mode 0010: 16-bit mode0 0100: 16-bit mode1 0110: 16-bit mode2 1000: 16-bit mode3 1010: 9-bit mode 1100: 8-bit 256K mode 1110: 8-bit 65K mode xxx1: 24-bit for DSI |
| 27 | / | / | / |
| 26 | R/W | 0x0 | DA Pin A1 value in 8080 mode auto/flash states |
| 25 | R/W | 0x0 | CA Pin A1 value in 8080 mode WR/RD execute |

| Offset: 0x0060 | | | Register Name: LCD_CPU_IF_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 24 | / | / | / |
| 23 | R | 0x0 | WR_FLAG The status of write operation. 0: Write operation is finishing 1: Write operation is pending |
| 22 | R | 0x0 | RD_FLAG The status of read operation. 0: Read operation is finishing 1: Read operation is pending |
| 21:18 | / | / | / |
| 17 | R/W | 0x0 | AUTO Auto transfer mode If it is 1, all the valid data during this frame are written to panel. Note: This bit is sampled by Vsync. |
| 16 | R/W | 0x0 | FLUSH Direct transfer mode If it is enabled, FIFO1 is regardless of the HV timing, the pixels data keep being transferred unless the input FIFO was empty. Data output rate is controlled by DCLK. |
| 15:4 | / | / | / |
| 3 | R/W | 0x0 | TRI_FIFO_BIST_EN Entry address is 0xFF8 0: Disable 1: Enable |
| 2 | R/W | 0x0 | TRI_FIFO_EN Enable the trigger FIFO 0: Disable 1: Enable |
| 1 | R/W1S | 0x0 | TRI_START Software must make sure that write '1' only when this flag is '0'. Writing '1' starts a frame flush and writing '0' has no effect. This flag indicates the frame flush is running. |
| 0 | R/W | 0x0 | TRI_EN Enable trigger mode 0: Trigger mode disable 1: Trigger mode enable |

5.1.6.16 0x0064 LCD CPU Panel Write Data Register (Default Value: 0x0000_0000)

| Offset: 0x0064 | | | Register Name: LCD_CPU_WR_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:24 | / | / | / |
| 23:0 | W | 0x0 | DATA_WR Data write on 8080 bus, launch a write operation on 8080 bus. |

5.1.6.17 0x0068 LCD CPU Panel Read Data Register0 (Default Value: 0x0000_0000)

| Offset: 0x0068 | | | Register Name: LCD_CPU_RD0_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:24 | / | / | / |
| 23:0 | R | 0x0 | DATA_RD0 Data read on 8080 bus, launch a new read operation on 8080 bus. |

5.1.6.18 0x006C LCD CPU Panel Read Data Register1 (Default Value: 0x0000_0000)

| Offset: 0x006C | | | Register Name: LCD_CPU_RD1_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:24 | / | / | / |
| 23:0 | R | 0x0 | DATA_RD1 Data read on 8080 bus, without a new read operation on 8080 bus. |

5.1.6.19 0x0084 LCD LVDS Interface Register (Default Value: 0x0000_0000)

| Bit | Read/Write | Default/Hex | Description |
| 12:0 | R/W | 0x0 | CEU_COEF_MUL_VALUE Signed 13-bit value, range of (-16,16). N=0: Rr N=1: Rg N=2: Rb N=4: Gr N=5: Gg N=6: Gb N=8: Br N=9: Bg N=10: Bb |

5.1.6.25 0x011C+N*0x10 (N=0-2) LCD CEU Coefficient Register1 (Default Value: 0x0000_0000)

| Offset: 0x011C+N*0x10 (N=0-2) | | | Register Name: LCD_CEU_COEF_ADD_REG |
|-------------------------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:19 | / | / | / |
| 18:0 | R/W | 0x0 | CEU_COEF_ADD_VALUE Signed 19-bit value, range of (-16384, 16384). N=0: Rc N=1: Gc N=2: Bc |

5.1.6.26 0x0140+N*0x04 (N=0-2) LCD CEU Coefficient Register2 (Default Value: 0x0000_0000)

| Offset: 0x0140+N*0x04 (N=0-2) | | | Register Name: LCD_CEU_COEF_RANG_REG |
|-------------------------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:24 | / | / | / |
| 23:16 | R/W | 0x0 | CEU_COEF_RANGE_MIN Unsigned 8-bit value, range of [0, 255]. |
| 15:8 | / | / | / |
| 7:0 | R/W | 0x0 | CEU_COEF_RANGE_MAX Unsigned 8-bit value, range of [0, 255]. |

5.1.6.27 0x0160 LCD CPU Panel Trigger Register0 (Default Value: 0x0000_0000)

| Offset: 0x0160 | | | Register Name: LCD_CPU_TRI0_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:28 | / | / | / |
| 27:16 | R/W | 0x0 | BLOCK_SPACE The spaces between data blocks. It should be set >20*pixel. |
| 15:12 | / | / | / |
| 11:0 | R/W | 0x0 | BLOCK_SIZE The size of data block. It is usually set as X. |

5.1.6.28 0x0164 LCD CPU Panel Trigger Register1 (Default Value: 0x0000_0000)

| Offset: 0x0164 | | | Register Name: LCD_CPU_TRI1_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | R | 0x0 | BLOCK_CURRENT_NUM Shows the current data block transmitting to panel. |
| 15:0 | R/W | 0x0 | BLOCK_NUM The number of data blocks. It is usually set as Y. |

5.1.6.29 0x0168 LCD CPU Panel Trigger Register2 (Default Value: 0x0020_0000)

| Offset: 0x0168 | | | Register Name: LCD_CPU_TRI2_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | R/W | 0x20 | START_DLY $T_{dly} = (Start_Delay + 1) * be_clk * 8.$ |
| 15 | R/W | 0x0 | TRANS_START_MODE Select the FIFOs used in CPU mode. 0: ECC_FIFO+TRI_FIFO 1: TRI_FIFO |
| 14:13 | R/W | 0x0 | SYNC_MODE Set the sync mode in CPU interface. 0x: Auto 10: 0 11: 1 |
| 12:0 | R/W | 0x0 | TRANS_START_SET Usual set as the length of a line. |

5.1.6.30 0x016C LCD CPU Panel Trigger Register3 (Default Value: 0x0000_0000)

| Offset: 0x016C | | | Register Name: LCD_CPU_TRI3_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:30 | / | / | / |
| 29:28 | R/W | 0x0 | TRI_INT_MODE When set as 01, the Tri_Counter_Int occurs in cycle of (Count_N+1)×(Count_M+1)×4 dclk. When set as 10 or 11, the io0 is map as TE input. 00: Disable 01: Counter mode 10: Te rising mode 11: Te falling mode |
| 27:24 | / | / | / |
| 23:8 | R/W | 0x0 | COUNTER_N The value of counter factor |
| 7:0 | R/W | 0x0 | COUNTER_M The value of counter factor |

5.1.6.31 0x0170 LCD CPU Panel Trigger Register4 (Default Value: 0x0000_0000)

| Offset: 0x0170 | | | Register Name: LCD_CPU_TRI4_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:29 | / | / | / |
| 28 | R/W | 0x0 | PLUG_MODE_EN Enable the plug mode used in dsi command mode. 0: Disable 1: Enable |
| 27:25 | / | / | / |
| 24 | R/W | 0x0 | A1_First_Valid Valid in first Block. |
| 23:0 | R/W | 0x0 | D23_TO_D0_First_Valid Valid in first Block. |

5.1.6.32 0x0174 LCD CPU Panel Trigger Register5 (Default Value: 0x0000_0000)

| Offset: 0x0174 | | | Register Name: LCD_CPU_TRI5_REG |
|----------------|------------|-------------|---------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:25 | / | / | / |

| Offset: 0x0174 | | | Register Name: LCD_CPU_TR15_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 24 | R/W | 0x0 | A1_NON_First_Valid Valid in Block except first. |
| 23:0 | R/W | 0x0 | D23_TO_D0_NON_First_Valid Valid in Block except first. |

5.1.6.33 0x0180 LCD Color Map Control Register (Default Value: 0x0000_0000)

| Offset: 0x0180 | | | Register Name: LCD_CMAP_CTL_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |

5.2 TCON_TV

5.2.1 Overview

The Timing Controller_TV (TCON_TV) is a module that processes video signals received from systems using a complicated arithmetic and then generates control signals and transmits them to the TV panel driver IC.

The TCON_TV includes the following features:

- Supports 10-bit pixel depth YUV444, and HV format output up to 4K@60Hz
- Supports 8-bit pixel depth YUV444, and HV format output up to 4K@60Hz

5.2.2 Functional Description

5.2.2.1 CEU Module

Function: This module enhance color data from DE .

$$R' = Rr * R + Rg * G + Rb * B$$

$$G' = Gr * R + Gg * G + Gb * B$$

$$B' = Br * R + Bg * G + Bb * B$$

Rr, Rg, Rb, Gr, Gg, Gb, Br, Bg, Bb bool 0,1

R, G, B u10 [0-1023]

R' have the range of [Rmin, Rmax]

G' have the range of [Rmin, Rmax]

B' have the range of [Rmin, Rmax]

5.2.3 Register List

| Module Name | Base Address |
|-------------|--------------|
| TCON_TV0 | 0x05470000 |

5.3 TV Encoder

5.3.1 Overview

The TV Encoder (TVE) module is a highly programmable digital video encoder supporting worldwide video standards Composite Video Broadcast Signal (CVBS).

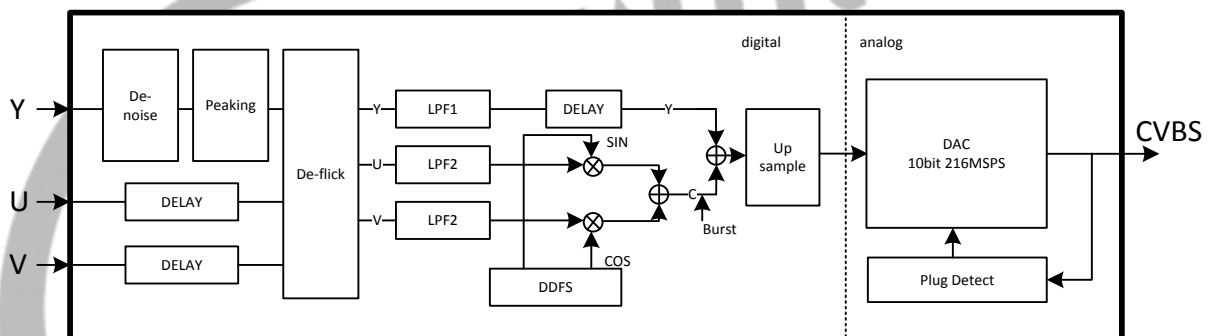

The TVE includes the following features:

- 1-channel CVBS output, supporting PAL-D and NTSC-M
- Plug status auto detecting
- 10 bits DAC output

5.3.2 Block Diagram

Figure 5-14 shows a block diagram of the TVE.

Figure 5-14 TVE Block Diagram

5.3.3 Functional Description

5.3.3.1 External Signals

Table 5-11 describes the external signals of TVE.

Table 5-11 TVE External Signals

| Port Name | Description | Type |
|-----------|----------------|------|
| TVOUT0 | TV CVBS output | AO |
| VCC-TVOUT | TV DAC power | P |

5.3.3.2 Clock Sources

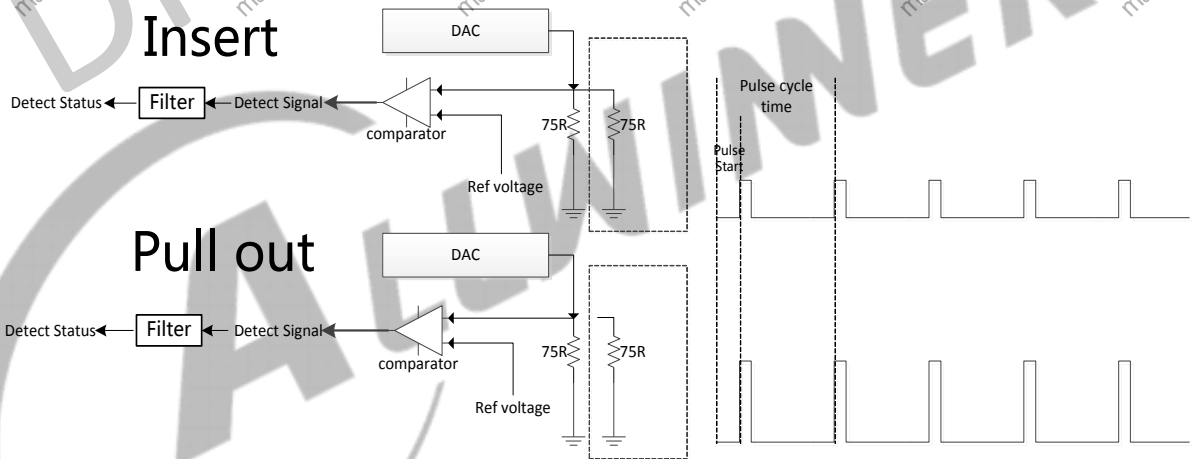

The TVE module requires one clock with 50% duty. Digital circuit and Analog circuit work by this clock. Mode and Clock frequency is shown below.

Table 5-12 TVE Clock Sources

| Mode | TVE Clock Frequency |
|------|---------------------|
| NTSC | 216 MHz |
| PAL | 216 MHz |

5.3.3.3 Auto Detection Function

Figure 5-15 Auto Detection Function

DAC outputs constant current, when insert, external load is 37.5Ω; when pull out, external load is 75Ω. The method that comparator judges pin level can detect plug action.

Because plug action may exist jitter, then there need be a filter to filter jitter, the debounce time of filter is set through the bit[3:0] of TV Encoder Auto Detection de-bounce Setting Register.

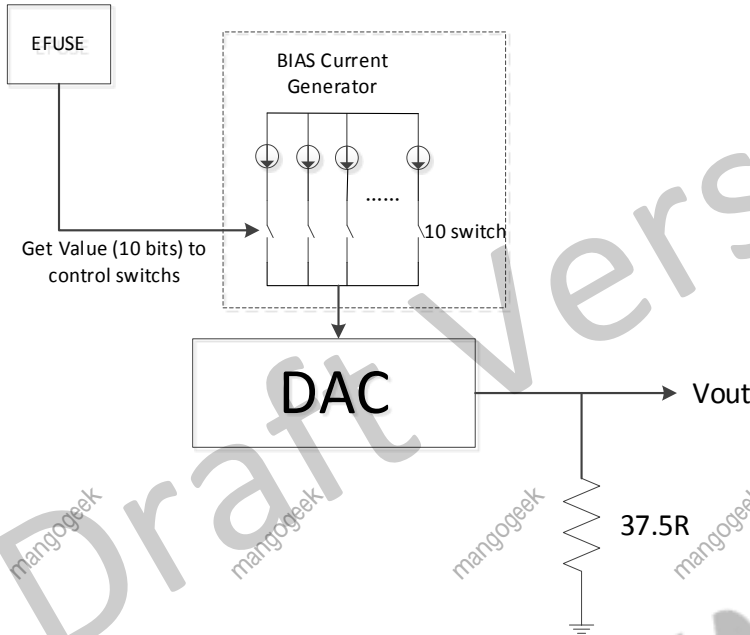

The pulse cycle time can be set through the bit[30:16] of TV Encoder Auto Detect Configuration Register1, the pulse start time can be set through the bit[14:0] of TV Encoder Auto Detect Configuration Register1. The clock sources of the two time are 32KHz clock.

Pulse width is cycle time of 4 clock sources.

Pulse amplitude can be set through the bit[9:0] of TV Encoder Auto Detect Configuration Register0.

5.3.3.4 DAC Calibration Function

Figure 5-16 DAC Calibration Function

After FT, 10-bit calibration value is burned into efuse. Every time software can read the 10-bit calibration value from efuse, to control BIAS current and BIAS current switch, then a specific BIAS current is generated to calibrate maximum output voltage of DAC.

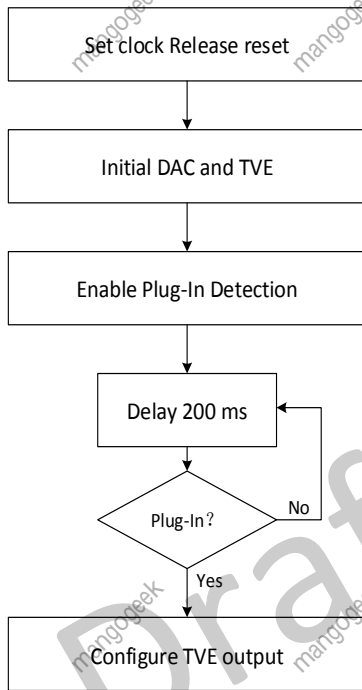

5.3.4 Programming Guidelines

5.3.4.1 Operating TVE Module

Operate TVE module by the following steps, Figure 5-17 shows the process diagram.

- Step 1** Set CCU clock source for TVE, and release AHB bus, and module reset.
- Step 2** Initial DAC amplitude value from efuse calibration value which has burned.
- Step 3** Enable the plug-in detect function, and detect plug-in status every 200 ms.
- Step 4** When the plug-in has detected, configure TVE module to output mode setting by application.

Figure 5-17 Operating TVE Module

5.3.5 Register List

| Module Name | Base Address |
|-------------|--------------|
| TVE_TOP | 0x05600000 |
| TVE | 0x05604000 |

5.3.7.5 0x0010 TV Encoder Chroma Frequency Register (Default Value: 0x21F0_7C1F)

| Offset: 0x0010 | | | Register Name: TVE_010_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x21f07c1f | Chroma_Freq Specify the ratio between the color burst frequency. 32 bits unsigned fraction. The default value is h21f07c1f, which is compatible with NTSC spec. 3.5795455 MHz (X'21F07C1F'): NTSC-M, NTSC-J 4.43361875 MHz(X'2A098ACB'): PAL-B, D, G, H,I, N 3.582056 MHz (X'21F69446'): PAL-N(Argentina) 3.579611 MHz (X'21E6EFE3'): PAL-M |

5.3.7.6 0x0014 TV Encoder Front/Back Porch Register (Default Value: 0x0076_0020)

| Offset: 0x0014 | | | Register Name: TVE_014_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:25 | / | / | / |
| 24:16 | R/W | 0x76 | Back_Porch Specify the width of the back porch in encoder clock cycles. Min value is (burst_width+breeze_way+17). 8 bits unsigned integer. The default value is 118. For 720p mode, the value is 260. For 1080i/p mode, the value is 192. |
| 15:12 | / | / | / |
| 11:0 | R/W | 0x20 | Front_Porch Must be even Specify the width of the front porch in encoder clock cycles. 6 bits unsigned even integer. Allowed range is form 10 to 62. The default value is 32. For 1080i mode, the value is 44. |

5.3.7.7 0x0018 TV Encoder HD Mode VSYNC Register (Default Value: 0x0000_0016)

| Offset: 0x0018 | | | Register Name: TVE_018_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:28 | / | / | / |
| 27:16 | R/W | 0x0 | Broad_Plus_Cycle_Number_In_HD_Mode_VSYNC |
| 15:12 | / | / | / |
| 11:0 | R/W | 0x16 | Front_Porch_Like_In_HD_Mode_VSYNC |

5.3.7.8 0x001C TV Encoder Line Number Register (Default Value: 0x0016_020D)

| Offset: 0x001C | | | Register Name: TVE_01C_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:24 | / | / | / |
| 23:16 | R/W | 0x16 | First_Video_Line Specify the index of the first line in a field/frame to have active video. 8 bits unsigned integer. |

| Offset: 0x001C | | | Register Name: TVE_01C_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| | | | For interlaced video: When VSync5=B'0', FirstVideoLine is restricted to be greater than 7. When VSync5=B'1', FirstVideoLine is restricted to be greater than 9. |
| 15:11 | / | / | / |
| 10:0 | R/W | 0x20D | <p>Num_Lines</p> <p>Specify the total number of lines in a video frame. 11 bits unsigned integer. Allowed range is 0 to 2048.</p> <p>For interlaced video: When NTSC, and FirstVideoLine is greater than 20, then NumLines is restricted to be greater than 2*(FirstVideoLine+18).</p> <p>When NTSC, and FirstVideoLine is not greater than 20, then NumLines is restricted to be greater than 77. When PAL, and FirstVideoLine is greater than 22, then NumLines is restricted to be greater than 2*(FirstVideoLine+18). When PAL, and FirstVideoLine is not greater than 22, then NumLines is restricted to be greater than 81.</p> <p>If NumLines is even, then it is restricted to be divisible by 4. If NumLines is odd, then it is restricted to be divisible by 4 with a remainder of 1.</p> |

5.3.7.9 0x0020 TV Encoder Level Register (Default Value: 0x00F0_011A)

| Offset: 0x0020 | | | Register Name: TVE_020_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:26 | / | / | / |
| 25:16 | R/W | 0xf0 | <p>Blank_Level</p> <p>Specify the blank level setting for active lines. This is 10 bits unsigned integer. Allowed range is from 0 to 1023.</p> |
| 15:10 | / | / | / |
| 9:0 | R/W | 0x11a | <p>Black_Level</p> <p>Specify the black level setting. This is 10 bits unsigned integer. Allowed range is from 240 to 1023.</p> |

5.3.7.10 0x0030 TV Encoder Auto Detection Enable Register (Default Value: 0x0000_0000)

| Offset: 0x0030 | | | Register Name: TVE_030_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R/W | 0x0 | DAC_AUTO_DETECT_MODE_SEL 0: Old Mode 1: New Mode |
| 30:17 | / | / | / |
| 16 | R/W | 0x0 | DAC0_Auto_Detect_Interrupt_En |
| 15:1 | / | / | / |
| 0 | R/W | 0x0 | DAC0_Auto_Detect_Enable |

5.3.7.11 0x0034 TV Encoder Auto Detection Interrupt Status Register (Default Value: 0x0000_0000)

| Offset: 0x0034 | | | Register Name: TVE_034_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:1 | / | / | / |
| 0 | R/W1C | 0x0 | DAC0_Auto_Detect_Interrupt_Active_Flag Write 1 to inactive DAC0 auto detection interrupt |

5.3.7.12 0x0038 TV Encoder Auto Detection Status Register (Default Value: 0x0000_0000)

| Offset: 0x0038 | | | Register Name: TVE_038_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:2 | / | / | / |
| 1:0 | R | 0x0 | DAC0_Status 00: Unconnected 01: Connected 11: Short to ground 10: Reserved |

5.3.7.13 0x003C TV Encoder Auto Detection Debounce Setting Register (Default Value: 0x0000_0000)

| Offset: 0x003C | | | Register Name: TVE_03C_REG |
|----------------|------------|-------------|----------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:26 | / | / | / |

| Offset: 0x003C | | | Register Name: TVE_03C_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 25:16 | R/W | 0x0 | DAC_TEST_REGISTER DAC test register. |
| 15:4 | / | / | / |
| 3:0 | R/W | 0x0 | DAC0_De_Bounce_Times The de_bounce time for hot plug detect function. |

5.3.7.14 0x00F8 TV Encoder Auto Detection Configuration Register0 (Default Value: 0x0000_0000)

| Offset: 0x00F8 | | | Register Name: TVE_0F8_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:10 | / | / | / |
| 9:0 | R/W | 0x0 | DETECT_Pulse_Value Use for DAC data input at auto detect pluse. Set the pulse amplitude. |

5.3.7.15 0x00FC TV Encoder Auto Detection Configuration Register1 (Default Value: 0x0000_0000)

| Offset: 0x00FC | | | Register Name: TVE_0FC_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31 | / | / | / |
| 30:16 | R/W | 0x0 | DETECT_Pulse_Periods Use 32K clock |
| 15 | / | / | / |
| 14:0 | R/W | 0x0 | DETECT_Pulse_Start Detect signal start time |

5.3.7.16 0x0100 TV Encoder Color Burst Phase Reset Configuration Register (Default Value: 0x0000_0001)

| Offset: 0x0100 | | | Register Name: TVE_100_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:2 | / | / | / |
| 1:0 | R/W | 0x1 | Color_Phase_Reset Color burst phase period selection |

| Offset: 0x0100 | | | Register Name: TVE_100_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| | | | <p>These bits select the number of fields or lines after which the color burst phase is reset to its initial value as specified by the ChromaPhase parameter, This parameter is application only for interlaced video.</p> <p>00: 8 field 01: 4 field 10: 2 lines 11: only once</p> |

5.3.7.17 0x0104 TV Encoder VSYNC Number Register (Default Value: 0x0000_0000)

| Offset: 0x0104 | | | Register Name: TVE_104_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:1 | / | / | / |
| 0 | R/W | 0x0 | <p>VSync5 Number of equalization pulse selection This bit selects whether the number of equalization pulses is 5 or 6. This parameter is applicable only for interlaced video. 0: 5 equalization pulse(default) 1: 6 equalization pulses</p> |

5.3.7.18 0x0108 TV Encoder Notch Filter Frequency Register (Default Value: 0x0000_0002)

| Offset: 0x0108 | | | Register Name: TVE_108_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:3 | / | / | / |
| 2:0 | R/W | 0x2 | <p>Notch_Freq Luma notch filter center frequency selection These bits select the luma notch filter (which is a band-reject filter) center frequency. In two of the selections, the filter width affects also the selection of the center frequency. 000: 1.1875 001: 1.1406 010: 1.0938. When notch_wide value is B'1' (this selection is proper for CCIR-NTSC), or 1.0000 when notch_wide value is B'0'.</p> |

| Offset: 0x0108 | | | Register Name: TVE_108_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| | | | 011: 0.9922. This selection is proper for NTSC with square pixels. 100: 0.9531. This selection is proper for PAL with square pixel. 101: 0.8359 when notch_wide value is B'1' (this selection is proper for CCIR-PAL), or 0.7734 when notch_wide value is B'0'. 110: 0.7813 111: 0.7188 |

5.3.7.19 0x010C TV Encoder Cb/Cr Level/Gain Register (Default Value: 0x0000_004F)

| Offset: 0x010C | | | Register Name: TVE_10C_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15:8 | R/W | 0x0 | Cr_Burst_Level Specify the amplitude of the Cr burst. 8 bit 2's complement integer. Allowed range is from (-127) to 127. |
| 7:0 | R/W | 0x4f | Cb_Burst_Level Specify the amplitude of the Cb burst. 8 bit 2's complement integer. Allowed range is from (-127) to 127. |

5.3.7.20 0x0110 TV Encoder Tint and Color Burst Phase Register (Default Value: 0x0000_0000)

| Offset: 0x0110 | | | Register Name: TVE_110_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:24 | / | / | / |
| 23:16 | R/W | 0x0 | Tint Specify the tint adjustment of the chroma signal for CVBS and Y/C outputs. The adjustment is effected by setting the sub-carrier phase to the value of this parameter. 8.8 bit unsigned fraction. Units are cycles of the color burst frequency. |
| 15:8 | / | / | / |
| 7:0 | R/W | 0x0 | Chroma_Phase |

| Offset: 0x0110 | | | Register Name: TVE_110_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| | | | <p>Specify the color burst initial phase (ChromaPhase). 8.8 bit unsigned fraction. Units are cycles of the color burst frequency.</p> <p>The color burst is set to this phase at the first HSYNC and then reset to the same value at further HSYNCs as specified by the CPhaseRset bits of the EncConfig5 parameter (see above)</p> |

5.3.7.21 0x0114 TV Encoder Burst Width Register (Default Value: 0x0016_447E)

| Offset: 0x0114 | | | Register Name: TVE_114_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:24 | R/W | 0x0 | <p>Back_Porch</p> <p>Breezeway like in HD mode VSync</p> <p>For 720p mode, the value is 220</p> <p>For 2080i/p mode, the value is 88 (default)</p> |
| 23 | / | / | / |
| 22:16 | R/W | 0x16 | <p>Breezeway</p> <p>Must be even</p> <p>Specify the width of the breezeway in encoder clock cycles. 5 bit unsigned integer. Allowed range is 0 to 31.</p> <p>For 1080i mode, the value is 44.</p> <p>For 1080p mode, the value is 44.</p> <p>For 720p mode, the value is 40.</p> |
| 15 | / | / | / |
| 14:8 | R/W | 0x44 | <p>Burst_Width</p> <p>Specify the width of the color frequency burst in encoder clock cycles. 7 bit unsigned integer. Allowed range is 0 to 127.</p> <p>In hd mode, it is ignored.</p> |
| 7:0 | R/W | 0x7e | <p>HSync_Width</p> <p>Specify the width of the horizontal sync pulse in encoder clock cycles. Min value is 16. Max value is (FrontPorch + ActiveLine - BackPorch). Default value is 126. The sum of HSyncSize and BackPorch is restricted to be divisible by 4.</p> <p>For 720p mode, the value is 40.</p> <p>For 1080i/p mode, the value is 44.</p> |

5.3.7.22 0x0118 TV Encoder Cb/Cr Gain Register (Default Value: 0x0000_A0A0)

| Offset: 0x0118 | | | Register Name: TVE_118_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15:8 | R/W | 0xa0 | Cr_Gain Specify the Cr color gain. 8-bit unsigned fraction. |
| 7:0 | R/W | 0xa0 | Cb_Gain Specify the Cb color gain. 8-bit unsigned fraction. |

5.3.7.23 0x011C TV Encoder Sync and VBI Level Register (Default Value: 0x0010_00F0)

| Offset: 0x011C | | | Register Name: TVE_11C_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:26 | / | / | / |
| 25:16 | R/W | 0x10 | Sync_Level Specify the sync pulse level setting. 8-bit unsigned integer. Allowed range is from 0 to ABlankLevel-1 or VBlankLevel-1 (whichever is smaller). |
| 15:10 | / | / | / |
| 9:0 | R/W | 0xf0 | VBlank_Level Specify the blank level setting for non active lines. 10-bit unsigned integer. Allow range is from 0 to 1023. |

5.3.7.24 0x0120 TV Encoder White Level Register (Default Value: 0x01E8_0320)

| Offset: 0x0120 | | | Register Name: TVE_120_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:26 | / | / | / |
| 25:16 | R/W | 0x1e8 | HD_Sync_Breezeway_Level Specify the breezeway level setting. 10-bit unsigned integer. Allowed range is from 0 to 1023. |
| 15:10 | / | / | / |
| 9:0 | R/W | 0x320 | White_Level Specify the white level setting. 10-bit unsigned integer. Allowed range is from black_level+1 or vbi_blank_level +1 (whichever is greater) to 1023. |

5.3.7.25 0x0124 TV Encoder Video Active Line Register (Default Value: 0x0000_05A0)

| Offset: 0x0124 | | | Register Name: TVE_124_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:12 | / | / | / |
| 11:0 | R/W | 0x5A0 | Active_Line Specify the width of the video line in encoder clock cycles. 12-bit unsigned multiple of 4 integer. Allowed range is from 0 to 4092. |

5.3.7.26 0x0128 TV Encoder Video Chroma BW and CompGain Register (Default Value: 0x0000_0000)

| Offset: 0x0128 | | | Register Name: TVE_128_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:18 | / | / | / |
| 17:16 | R/W | 0x0 | Chroma_BW Chroma filter bandwidth selection This bit specifies whether the bandwidth of the chroma filter is: 00: Narrow width 0.6 MHz 01: Wide width 1.2 MHz 10: Extra width 1.8 MHz 11: Ultra width 2.5 MHz |
| 15:2 | / | / | / |
| 1:0 | R/W | 0x0 | Comp_Ch_Gain Chroma gain selection for the composite video signal. These bits specify the gain of the chroma signal for composing with the luma signal to generate the composite video signal: 00: 100% 01: 25% 10: 50% 11: 75% |

5.3.7.27 0x012C TV Encoder Register (Default Value: 0x0000_0101)

| Offset: 0x012C | | | Register Name: TVE_12C_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:9 | / | / | / |
| 8 | R/W | 0x1 | <p>Notch_Width</p> <p>Luma notch filter width selection</p> <p>This bit selects the luma notch filter (which is a band-reject filter) width.</p> <p>0: Narrow</p> <p>1: Wide</p> |
| 7:1 | / | / | / |
| 0 | R/W | 0x1 | <p>Comp_YUV_EN</p> <p>This bit selects if the components video output are the RGB components or the YUV components.</p> <p>0: The three component outputs are the RGB components.</p> <p>1: The three component outputs are the YUV components, (i.e. the color conversion unit is bypassed)</p> |

5.3.7.28 0x0130 TV Encoder Re-sync Parameters Register (Default Value: 0x0010_0001)

| Offset: 0x0130 | | | Register Name: TVE_130_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R/W | 0x0 | <p>Re_Sync_Field</p> <p>Re-sync field</p> |
| 30 | R/W | 0x0 | <p>Re_Sync_Dis</p> <p>0: Re-Sync Enable</p> <p>1: Re-Sync Disable</p> |
| 29:27 | / | / | / |

| 15:11 | / | / | / |
| 10:0 | R/W | 0x1 | <p>Re_Sync_Pixel_Num</p> <p>Re-sync line pixel from TCON</p> |

5.3.7.29 0x0134 TV Encoder Slave Parameter Register (Default Value: 0x0000_0000)

| Offset: 0x0134 | | | Register Name: TVE_134_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:9 | / | / | / |
| 8 | R/W | 0x0 | <p>Slave_Thresh Horizontal line adjustment threshold selection This bit selects whether the number of lines after which the Video Encoder starts the horizontal line length adjustment is slave mode is 0 or 30.</p> <p>0: Number of lines is 0 1: Number of lines is 30</p> |
| 7:1 | / | / | / |
| 0 | R/W | 0x0 | <p>Slave_Mode Slave mode selection This bit selects whether the Video Encoder is sync slave, partial slave or sync master. It should be set to B'0'.</p> <p>0: The Video Encoder is not a full sync slave (i.e. it is a partial sync slave or a sync master) 1: Reserved</p> |

5.3.7.30 0x0138 TV Encoder Configuration Register (Default Value: 0x0000_0000)

| Offset: 0x0138 | | | Register Name: TVE_138_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:9 | / | / | / |
| 8 | R/W | 0x0 | <p>Invert_Top Field parity input signal (top_field) polarity selection. This bit selects whether the top field is indicated by a high level of the field parity signal or by the low level. The bit is applicable both when the Video Encoder is the sync master and when the Video Encoder is the sync slave.</p> <p>0: Top field is indicated by low level 1: Top field is indicated by high level</p> |
| 7:1 | / | / | / |
| 0 | R/W | 0x0 | <p>UV_Order This bit selects if the sample order at the chroma input to the Video Encoder is Cb first (i.e. Cb 0 Cr 0 Cb 1 Cr 1) or Cr first (i.e. Cr 0 Cb 0 Cr 1 Cb 1).</p> |

| Offset: 0x0138 | | | Register Name: TVE_138_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| | | | 0: The chroma sample input order is Cb first 1: The chroma sample input order is Cr first |

5.3.7.31 0x013C TV Encoder Configuration Register (Default Value: 0x0000_0001)

| Offset: 0x013C | | | Register Name: TVE_13C_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:27 | / | / | / |
| 26:24 | R/W | 0x0 | RGB_Sync R, G and B signals sync embedding selection. These bits specify whether the sync signal is added to each of the R, G and B components (b'1') or not (b'0'). The bit[26] specify if the R signal has embedded syncs, the bit[25] specify if the G signal has embedded syncs and the bit[24] specify if the B signal has embedded syncs. When comp_yuv is equal to b'1', these bits are N.A. and should be set to b'000'. When the value is different from b'000', RGB_Setup should be set to b'1'. |
| 23:17 | / | / | / |
| 16 | R/W | 0x0 | RGB_Setup "Set-up" enable for RGB outputs. This bit specifies if the "set-up" implied value (black_level – blank_level) specified for the CVBS signal is used also for the RGB signals. 0: The "set-up" is not used, or i.e. comp_yuv is equal to b'1'. 1: The implied "set-up" is used for the RGB signals |
| 15:1 | / | / | / |
| 0 | R/W | 0x1 | Bypass_YClamp Y input clamping selection This bit selects whether the Video Encoder Y input is clamped to 64 to 940 or not. When not clamped the expected range is 0 to 1023. The U and V inputs are always clamped to the range 64 to 960. 0: The Video Encoder Y input is clamped 1: The Video Encoder Y input is not clamped |

5.3.7.32 0x0380 TV Encoder Low Pass Control Register (Default Value: 0x0000_0000)

| Offset: 0x0380 | | | Register Name: TVE_380_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |

| 0 | R/W | 0x0 | EN |

5.4 MIPI DSI

5.4.1 Overview

The Display Serial Interface is a high-speed interface between a host processor and peripheral devices that adhere to MIPI Alliance specifications for mobile device interfaces. This DSI module is composed of a DSI controller which is compliance with MIPI DSI specification V1.01 and a D-PHY module which is compliance with MIPI DPHY specification V1.00.

The MIPI DSI includes the following features:

- Compliance with MIPI DSI v1.01
- Up to 4 lanes
- Supports 1280 x 720@60fps and 1920 x 1200@60fps
- Supports non-burst mode with sync pulse/sync event, burst mode and command mode
- Supports pixel format: RGB888, RGB666, RGB666 loosely packed and RGB565
- Supports continuous lane clock mode and non-continuous lane clock mode
- Compliance with MIPI DCS v1.01, bidirectional communication in LP through data lane 0
- Supports bidirectional communication of all generic commands in LP through data lane 0
- Supports low power data transmission
- Supports ULPS and Escape modes
- Hardware checksum capabilities

5.5 HDMI

5.5.1 Overview

The High Definition Multimedia Interface (HDMI) is a wired digital interconnect that replaces the analog SCART connection. HDMI can transfer uncompressed video, audio, and data using a single cable.

The system architecture of HDMI consists of sources (transmitter) and sinks (receiver). The HDMI cable and connectors carry four differential pairs that make up the TMDS data and clock channels. These channels are used to carry video, audio, and auxiliary data. In addition, HDMI carries a VESA Data Display Channel (DDC). The DDC is used for configuration and status exchange between a single source and a single sink. The optional CEC protocol provides high-level control functions between all of the various audiovisual products in a user's environment.

The HDMI includes the following features:

- Compatible with HDMI 2.0
- Supports DDC and SCDC
- Integrated CEC hardware engine
- Optional color space converter (CSC): RGB (4:4:4) to/from YCbCr (4:4:4 or 4:2:2)
- Video formats:
 - All CEA-861-E video formats up to 1080p at 60 Hz and 720p/1080i at 120 Hz
 - Optional HDMI 1.4b video formats
 - All CEA-861-E video formats up to 1080p at 120 Hz
 - HDMI 1.4b 4K x 2K video formats
 - HDMI 1.4b 3D video modes with up to 340 MHz (TMDS clock)
 - Optional HDMI 2.0 video formats
 - All CEA-861-F video formats
 - Dynamic Range and Mastering InfoFrame (DRM, packet header 0x87)
- Audio formats:
 - Uncompressed audio formats: IEC60985 L-PCM audio samples, up to 192 kHz
 - Compressed audio formats: IEC61937 compressed audio, up to 1536 kHz (for HDMI 2.0b)/768 kHz

(for HDMI 1.4b)

6 Video Input Interfaces

6.1 CSIC

6.1.1 Overview

The CMOS Sensor Interface Controller (CSIC) is an image or video data receiver, which can receive image or video data via camera interface and store the data in memory directly.

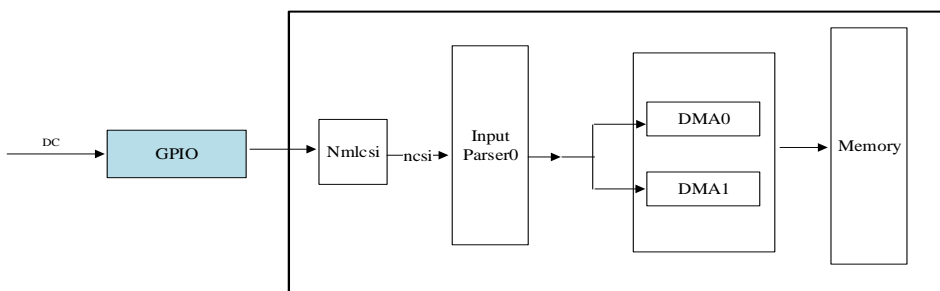

The CSIC includes the following features:

- Supports 8-bit digital camera interface
- Supports BT656 Interface
 - Supports time-multiplexed format
 - Supports dual data rate sample mode with pixel clock up to 148.5 MHz
- Supports BT601 Interface
- Supports crop function
- Supports frame rate down
- Supports 2 DMA for 2 video stream storage
 - Supports de-interlacing for interlace video input
 - Supports conversion from YUV422 to YUV420, YUV422 to YUV400, YUV420 to YUV400
 - Supports horizontal and vertical flip

6.1.2 Block Diagram

Figure 6-1 shows block diagram of the CSIC.

Figure 6-1 CSIC Block Diagram

6.1.3 Functional Description

6.1.3.1 External Signals

Table 6-1 CSIC External Signals

| Port Name | Description | Type |
|--------------|------------------------------|------|
| NCSI0-PCLK | Parallel CSI Pixel Clock | I |
| NCSI0-MCLK | Parallel CSI Master Clock | O |
| NCSI0-HSYNC | Parallel CSI Horizontal Sync | I |
| NCSI0-VSYNC | Parallel CSI Vertical Sync | I |
| NCSI0-D[7:0] | Parallel CSI Data Bit | I |
| NCSI0-FIELD | Parallel CSI Field Index | I |

6.1.3.2 CSIC FIFO Distribution

Table 6-2 CSIC FIFO Distribution

| Interface | MIPI Interface | | |
|---------------|----------------|-------------|-----------------|
| Input format | YUV422 | | Raw |
| Output format | Planar | UV combined | Raw/RGB/PRGB |
| CH0_FIFO0 | Y | Y | All pixels data |
| CH0_FIFO1 | Cb (U) | CbCr (UV) | - |
| CH0_FIFO2 | Cr (V) | - | - |

Figure 6-3 RAW-12 Format

Figure 6-4 YUV-10 Format

Figure 6-5 RGB888 Format

Figure 6-6 PRGB888 Format

Figure 6-7 RGB565 Format

6.1.3.4 Offset Definition

Offset in horizontal and vertical can be added when receiving image. Unit is pixel.

For YUV422 format, pixel unit is a YU/YV combination.

For YUV420 format, pixel unit is a YU/YV combination in YC line, and only a Y in Y line.

For Bayer and RAW format, pixel unit is a R/G/B single component.

For RGB565, pixel unit is 2 bytes of RGB565 package.

For RGB888, pixel unit is 3 bytes of RGB combination.

6.1.3.5 Flip Definition

Both horizontal and vertical flip are supported at the same time. This function is implemented in the process of each FIFO writing data to memory, only flipping the data of separate FIFO, not changing component to FIFO distribution.

If horizontal flip is enabled, one or more pixels will be took as a unit:

For YUV format, a unit of $Y_0U_0Y_1V_1$ will parser and flip the Y component in one channel, and UV will be treated as a whole. In planar output mode, U and V will be flipped separately. In UV combined output mode, UV will be flipped as a whole. So, a sequence of $Y_1U_0Y_0V_1$ will be.

For Bayer_raw format, situation is much like. A GR/BG sequence will be changed to BG/RG. A unit of square has four pixels.

For RGB565/RGB888, one unit of two/three bytes of component will be flipped with original sequence.

6.1.4 Register List

| Module Name | Base Address |
|--------------|--------------|
| CSIC_CCU | 0x05800000 |
| CSIC_TOP | 0x05800800 |
| CSIC_PARSER0 | 0x05801000 |
| CSIC_DMA0 | 0x05809000 |
| CSIC_DMA1 | 0x05809200 |

CCU register list:

| Register Name | Offset | Register Description |
|-----------------------|--------|----------------------------------|
| CCU_CLK_MODE_REG | 0x0000 | CCU Clock Mode Register |
| CCU_PARSER_CLK_EN_REG | 0x0004 | CCU Parser Clock Enable Register |
| CCU_POST0_CLK_EN_REG | 0x000C | CCU Post0 Clock Enable Register |

CSIC TOP register list:

| Register Name | Offset | Register Description |
|-------------------------|--------|--|
| CSIC_TOP_EN_REG | 0x0000 | CSIC TOP Enable Register |

6.1.6 CSIC Top Register Description

6.1.6.1 0x0000 CSIC TOP Enable Register (Default Value:0x0000_0000)

| Offset: 0x0000 | | | Register Name: CSIC_TOP_EN_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:3 | / | / | / |
| 2 | R/W | 0x0 | BIST_MODE_EN 0: Closed 1: EN BIST TEST |
| 1 | / | / | / |
| 0 | R/W | 0x0 | CSIC_TOP_EN 0: Reset and disable the CSIC module 1: Enable the CSIC module |

6.1.6.2 0x0004 CSIC Pattern Generation Enable Register (Default Value:0x0000_0000)

| Offset: 0x0004 | | | Register Name: CSIC_PTN_GEN_EN_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:24 | / | / | / |
| 23:16 | R/W | 0x0 | PTN_CYCLE Pattern generating cycle counter. The pattern in dram will be generated in cycles of PTN_CYCLE+1. |
| 15:5 | / | / | / |
| 4 | R/WAC | 0x0 | PTN_START CSIC Pattern Generating Start 0: Finish other: Start Software write this bit to "1" to start pattern generating from DRAM. When finished, the hardware will clear this bit to "0" automatically. Generating cycles depends on PTN_CYCLE. |
| 3:1 | / | / | / |
| 0 | R/W | 0x0 | PTN_GEN_EN Pattern Generation Enable |

6.1.6.3 0x0008 CSIC Pattern Control Register (Default Value:0x0000_000F)

| Offset: 0x0008 | | | Register Name: CSIC_PTN_CTRL_REG |
|----------------|------------|-------------|----------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:26 | / | / | / |

| Offset: 0x0008 | | | Register Name: CSIC_PTN_CTRL_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 25:24 | R/W | 0x0 | PTN_PORT_SEL Pattern Generator output port selection 010:NCSIC0 others:reserved |
| 23:22 | / | / | / |
| 21:20 | R/W | 0x0 | PTN_GEN_DATA_WIDTH 00:8-bit 01:10-bit 10:12-bit 11:reserved |
| 19:16 | R/W | 0x0 | PTN_MODE Pattern mode selection 0000~0011:reserved 0100:NCSIC YUV 8 bits width 0101:NCSIC YUV 16 bits width 0110:reserved 0111:reserved 1000:BT656 8 bits width 1001:BT656 16 bits width 1010:reserved 1011:reserved 1100:BAYER 12 bits for ISPFE 1101:UYVY422 12 bits for ISPFE 1110:UYVY420 12 bits for ISPFE 1111:reserved |
| 15:10 | / | / | / |
| 9:8 | R/W | 0x0 | PTN_GEN_CLK_DIV Packet generator clock divider |
| 7:0 | R/W | 0xF | PTN_GEN_DLY Clocks delayed before pattern generating start. |

6.1.6.4 0x0020 CSIC Pattern Generation Length Register (Default Value:0x0000_0000)

| Offset: 0x0020 | | | Register Name: CSIC_PTN_LEN_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | PTN_LEN The pattern length in byte when generating pattern. |

6.1.6.5 0x0024 CSIC Pattern Generation Address Register (Default Value:0x0000_0000)

| Offset: 0x0024 | | | Register Name: CSIC_PTN_ADDR_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | PTN_ADDR The pattern DRAM address when generating pattern. |

6.1.6.6 0x0028 CSIC Pattern ISP Size Register (Default Value:0x0000_0000)

| Offset: 0x0028 | | | Register Name: CSIC_PTN_ISP_SIZE_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:29 | / | / | / |
| 28:16 | R/W | 0x0 | Height Vertical size, only valid for ISP mode pattern generation. |
| 15:13 | / | / | / |
| 12:0 | R/W | 0x0 | Width Horizontal size, only valid for ISP mode pattern generation. |

6.1.6.7 0x00A0 CSIC DMA0 Input Select Register (Default Value:0x0000_0000)

| Offset: 0x00A0 | | | Register Name: CSIC_DMA0_INPUT_SEL_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:4 | / | / | / |
| 3:0 | R/W | 0x0 | DMA0 Input Select 0000: input from ISPO CH0 0001: input from ISPO CH1 0010: input from ISPO CH2 0011: input from ISPO CH3 Others: Reserved |

6.1.6.8 0x00A4 CSIC DMA1 Input Select Register (Default Value:0x0000_0000)

| Offset: 0x00A4 | | | Register Name: CSIC_DMA1_INPUT_SEL_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:4 | / | / | / |
| 3:0 | R/W | 0x0 | DMA1 Input Select 0000: input from ISPO CH0 0001: input from ISPO CH1 0010: input from ISPO CH2 |

| Offset: 0x00A4 | | | Register Name: CSIC_DMA1_INPUT_SEL_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| | | | 0011: input from ISPO CH3 Others: Reserved |

6.1.6.9 0x00DC CSIC BIST CS Register (Default Value:0x0000_0000)

| Offset: 0x00DC | | | Register Name: CSIC_BIST_CS_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:3 | / | / | / |
| 2:0 | R/W | 0x0 | BIST_CS 000: Set when BK0 memory bist 001: Set when BK1 memory bist Others: Reserved |

6.1.6.10 0x00E0 CSIC BIST Control Register (Default Value:0x0000_0200)

| Offset :0x00E0 | | | Register Name: CSIC_BIST_CTRL_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15 | R | 0x0 | BIST_ERR_STA BIST Error Status 0: No effect 1: Error |
| 14:12 | R | 0x0 | BIST_ERR_PAT BIST Error Pattern |
| 11:10 | R | 0x0 | BIST_ERR_CYC BIST Error Cycle |
| 9 | R | 0x1 | BIST_STOP BIST STOP 0: Running 1: Stop |
| 8 | R | 0x0 | BIST_BUSY BIST Busy 0: Idle 1: Busy |
| 7:5 | R/W | 0x0 | BIST_REG_SEL BIST REG select |
| 4 | R/W | 0x0 | BIST_ADDR_Mode_SEL BIST Address Mode Select |
| 3:1 | R/W | 0x0 | BIST_WDATA_PAT |

| Offset :0x00E0 | | | Register Name: CSIC_BIST_CTRL_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| | | | BIST Write Data Pattern 000: 0x00000000 001: 0x55555555 010: 0x33333333 011: 0x0F0F0F0F 100: 0x00FF00FF 101: 0x0000FFFF others: Reserved |
| 0 | R/W | 0x0 | BIST_EN BIST Enable A positive will trigger the BIST to start. |

6.1.6.11 0x00E4 CSIC BIST Start Address Register (Default Value:0x0000_0000)

| Offset :0x00E4 | | | Register Name: CSIC_BIST_START_ADDR_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | BIST Start Address BIST Start Address. It is 32-bit aligned. |

6.1.6.12 0x00E8 CSIC BIST End Address Register (Default Value:0x0000_0000)

| Offset :0x00E8 | | | Register Name: CSIC_BIST_END_ADDR_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | BIST END Address BIST END Address. It is 32-bit aligned. |

6.1.6.13 0x00EC CSIC BIST Data Mask Register (Default Value:0x0000_0000)

| Offset :0x00EC | | | Register Name: CSIC_BIST_DATA_MASK_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | BIST_DATA_MASK BIST Data Mask 0: Unmask 1: Mask |

6.1.6.14 0x00F0 CSIC MBUS REQ MAX Register (Default Value:0x000F_0F0F)

| Offset: 0x00F0 | | | Register Name: CSIC_MBUS_REQ_MAX_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:5 | / | / | / |
| 4:0 | R/W | 0x0F | MCSI_MEM_REQ_MAX Maximum of request commands for the master granted in MCSI_MEM arbiter is N+1. |

6.1.6.15 0x0100 CSIC Multi-Frame Mode Register (Default Value:0x0000_0000)

| Offset: 0x0100 | | | Register Name: CSIC_MULF_MOD_REG |
|----------------|------------|-------------|----------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:24 | R | 0x0 | MULF_STATUS |
| 23:16 | / | / | / |
| 15:8 | R/W | 0x0 | MULF_CS |
| 7:1 | / | / | / |
| 0 | R/W | 0x0 | MULF_EN |

6.1.6.16 0x0104 CSIC Multi-Frame Interrupt Register (Default Value:0x0000_0000)

| Offset: 0x0104 | | | Register Name: CSIC_MULF_INT_REG |
|----------------|------------|-------------|----------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:18 | / | / | / |

| 15:2 | / | / | / |
| 1 | R/W | 0x0 | MULF_ERR_EN |
| 0 | R/W | 0x0 | MULF_DONE_EN |

6.1.7 Parser Register Description

6.1.7.1 0x0000 Parser Enable Register (Default Value:0x0000_0000)

| Offset: 0x0000 | | | Register Name: PRS_EN_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:17 | / | / | / |
| 16 | R/W | 0x0 | NCSIC_EN 0: Reset and disable the NCSIC module |

| Offset: 0x0000 | | | Register Name: PRS_EN_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| | | | 1: Enable the NCSIC module |
| 15 | R/W | 0x0 | PCLK_EN 0: Gate pclk input 1: Enable pclk input |
| 14:3 | / | / | / |
| 2 | R/W | 0x0 | PRS_CH_MODE 0: Parser output channel 0–3 corresponding from input channel 0–3 1: Parser output channel 0–3 all from input channel 0 (MIPI SEHDR) |
| 1 | R/W | 0x0 | PRS_MODE 0: Reserved 1: MCSI |
| 0 | R/W | 0x0 | PRS_EN 0: Reset and disable the parser module 1: Enable the parser module |

6.1.7.2 0x0004 Parser NCSIC Interface Configuration Register (Default Value:0x0105_0080)

| Offset: 0x0004 | | | Register Name: PRS_NCSI_IF_CFG_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R/W | 0x0 | YUV420_LINE_ORDER 0: YUV420 input in Y-YC-Y-YC Line Order 1: YUV420 input in YC-Y-YC-Y Line Order |
| 30:28 | / | / | / |
| 27:24 | R/W | 0x1 | FIELD_DT_PCLK_SHIFT Only for vsync detected field mode, the odd field permitted pclk shift = 4 * FIELD_DT_PCLK_SHIFT |
| 23:20 | R/W | 0x0 | Source type Bit 20–23 corresponding to the SRC_TYPES for channel0–3 0: Progressed 1: Interlaced |
| 19 | R/W | 0x0 | FIELD Field polarity (For YUV HV timing) 0: negative (field=0 indicates odd, field=1 indicates even) 1: positive (field=1 indicates odd, field=0 indicates even) Field sequence (For BT656 timing) 0: Normal sequence (field 0 first) 1: Inverse sequence (field 1 first) |
| 18 | R/W | 0x1 | VREF_POL Vref polarity |

| Offset: 0x0004 | | | Register Name: PRS_NCSI_IF_CFG_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| | | | 0: negative 1: positive This register is not applied to CCIR656 interface. |
| 17 | R/W | 0x0 | HERF_POL Href polarity 0: negative 1: positive This register is not applied to CCIR656 interface. |
| 16 | R/W | 0x1 | CLK_POL Data clock type 0: active in rising edge 1: active in falling edge |
| 15:14 | R/W | 0x0 | Field_DT_MODE (only valid when CSI_IF is YUV and source type is interlaced) 00: by both field and vsync 01: by field 10: by vsync 11: reserved |
| 13 | R/W | 0x0 | DDR_SAMPLE_MODE_EN 0: disable 1: enable |
| 12:11 | R/W | 0x0 | SEQ_8PLUS2 When select IF_DATA_WIDTH to be 8+2bit, odd/even pixel byte at CSI-D[11:4] will be rearranged to D[11:2]+2'b0 at the actual CSI data bus according to these sequences: 00: 6'bx+D[9:8], D[7:0] 01: D[9:2], 6'bx+D[1:0] 10: D[7:0], D[9:8]+6'bx 11: D[7:0], 6'bx+D[9:8] |
| 10:8 | R/W | 0x0 | IF_DATA_WIDTH 000: 8 bit data bus 001: 10 bit data bus 010: 12 bit data bus 011: 8+2bit data bus 100: 2x8bit data bus Others: Reserved |
| 7:6 | R/W | 0x2 | INPUT_SEQ Input data sequence, only valid for YUV422 and YUV420 input format. All data interleaved in one channel: 00: YUYV |

| Offset: 0x0004 | | | Register Name: PRS_NCSI_IF_CFG_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| | | | 01: YVYU 10: UYVY 11: VYUY Y and UV in separated channel: x0: UV x1: VU |
| 5 | / | / | / |
| 4:0 | R/W | 0x0 | CSI_IF YUV (separate syncs): 00000: RAW or YUV420/YUYV422 (each cycle one component input) Others: Reserved CCIR656 (embedded syncs): 00100: BT656 1 channel 01100: BT656 2 channels (All data interleaved in one data bus) 01110: BT656 4 channels (All data interleaved in one data bus) Others: Reserved |

6.1.7.3 0x000C Parser Capture Register (Default Value:0x0000_0000)

| Offset: 0x000C | | | Register Name: PRS_CAP_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:30 | / | / | / |
| 29:26 | R/W | 0x0 | CH3_FPS_DS Fps down sample 0: no down sample 1: 1/2 fps, only receives the first frame every 2 frames 2: 1/3 fps, only receives the first frame every 3 frames 3: 1/4 fps, only receives the first frame every 4 frames 4: 1/5 fps, only receives the first frame every 4 frames 15: 1/16 fps, only receives the first frame every 16 frames |
| 25 | R/W | 0x0 | CH3_VCAP_ON Video capture control: Capture the video image data stream on channel 3. 0: Disable video capture If video capture is in progress, the CSI stops capturing image data at the end of the current frame, and all of the current frame data is written to output FIFO. |

| Offset: 0x000C | | | Register Name: PRS_CAP_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| | | | 1: Enable video capture The CSI starts capturing image data at the start of the next frame. |
| 24 | RC/W | 0x0 | CH3_SCAP_ON Still capture control: Capture a single still image frame on channel 3. 0: Disable still capture 1: Enable still capture The CSI module starts capturing image data at the start of the next frame. The CSI module captures only one frame of image data. This bit is self cleared and always reads as a 0. |
| 13:12 | / | / | / |
| 21:18 | R/W | 0x0 | CH2_FPS_DS Fps down sample 0: no down sample 1: 1/2 fps, only receives the first frame every 2 frames 2: 1/3 fps, only receives the first frame every 3 frames 3: 1/4 fps, only receives the first frame every 4 frames 4: 1/5 fps, only receives the first frame every 4 frames 15: 1/16 fps, only receives the first frame every 16 frames |
| 17 | R/W | 0x0 | CH2_VCAP_ON Video capture control: Capture the video image data stream on channel 2. 0: Disable video capture If video capture is in progress, the CSI stops capturing image data at the end of the current frame, and all of the current frame data is written to output FIFO. 1: Enable video capture The CSI starts capturing image data at the start of the next frame. |
| 16 | RC/W | 0x0 | CH2_SCAP_ON Still capture control: Capture a single still image frame on channel 2. 0: Disable still capture 1: Enable still capture The CSI module starts capturing image data at the start of the next frame. The CSI module captures only one frame of image data. This bit is self cleared and always reads as a 0. |

6.1.7.42 0x033C Parser Channel_3 Input Parameter3 Register(Default Value:0x0000_0000)

| Offset: 0x033C | | | Register Name: PRS_CH3_INPUT_PARA3_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:30 | / | / | / |
| 29:16 | R | 0x0 | INPUT_Y |
| 15:14 | / | / | / |
| 13:0 | R | 0x0 | INPUT_X |

6.1.7.43 0x0340 Parser Channel_3 Interrupt Enable Register (Default Value:0x0000_0000)

| Offset: 0x0340 | | | Register Name: PRS_CH3_INT_EN_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:3 | / | / | / |
| 2 | R/W | 0x0 | MUL_ERR_INT_EN Multi-channel writing error Indicates error has been detected for writing data to a wrong channel. |
| 1 | R/W | 0x0 | INPUT_PARA1_INT_EN 0:disable 1:enable |
| 0 | R/W | 0x0 | INPUT_PARA0_INT_EN 0:disable 1:enable |

6.1.7.44 0x0344 Parser Channel_3 Interrupt Status Register (Default Value:0x0000_0000)

| Offset: 0x0344 | | | Register Name: PRS_CH3_INT_STA_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:3 | / | / | / |
| 2 | R/W1C | 0x0 | MUL_ERR_PD Multi-channel writing error |
| 1 | R/W1C | 0x0 | INPUT_SRC_PD1 When the parser input parameter0 register update, this flag is set to 1. Write 1 to clear. |
| 0 | R/W1C | 0x0 | INPUT_SRC_PD0 When the parser input parameter1 register, parser input parameter2 register or parser input parameter3 register update, this flag is set to 1. Write 1 to clear. |

6.1.7.45 0x0348 Parser Channel_3 Line Time Register (Default Value:0x0000_0000)

| Offset: 0x0348 | | | Register Name: PRS_CH3_LINE_TIME_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | RO | 0x0 | PRS_CH3_HBLK_TIME Time of H Blanking when vsync is valid The unit is csi_top_clk cycle |
| 15:0 | RO | 0x0 | PRS_CH3_HSYN_TIME Time of H SYNC when vsync is valid The unit is csi_top_clk cycle |

6.1.7.46 0x0500 CSIC Parser NCSIC RX Signal0 Delay Adjust Register (Default Value:0x0000_0000)

| Offset: 0x0500 | | | Register Name: CSIC_PRS_NCSIC_RX_SIGNAL0_DLY_ADJ_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:29 | / | / | / |
| 28:24 | R/W | 0x0 | Filed_dly 32 Step for adjust, 1 step = 0.2 ns |
| 23:21 | / | / | / |

6.1.8 CSIC DMA Register Description

6.1.8.1 0x0000 CSIC DMA Enable Register (Default Value:0x7000_0000)

| Offset:0x0000 | | | Register Name: CSIC_DMA_EN_REG |
|---------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R/W | 0x0 | VER_EN |
| 30 | R/W | 0x1 | VFLIP_BUF_ADDR_CFG_MODE Vflip buffer address set by software or calculated by hardware 0: Hardware 1: Software |
| 29 | R/W | 0x1 | BUF_LENGTH_CFG_MODE Buffer length set by software or calculated by hardware 0: Hardware 1: Software |
| 28 | R/W | 0x1 | FLIP_SIZE_CFG_MODE FLIP SIZE set by software or calculated by hardware 0: Hardware 1: Software |
| 27:8 | / | / | / |
| 7 | R/W | 0x0 | BUF_ADDR_MODE 0: Buffer Address Register Mode 1: Buffer Address FIFO Mode |
| 6 | R/W | 0x0 | VI_TO_CNT_EN Enable Video Input Timeout counter, add 1 when there is no effective video input in a 12M clock, clear to 0 when detecting effective video input. 0: Disable 1: Enable |
| 5 | R/W | 0x0 | FRAME_CNT_EN When BK_TOP_EN is enabled, setting 1 to this bit indicates the Frame counter starts to add. 0: Disable 1: Enable |
| 4 | R/W | 0x0 | DMA_EN When BK_TOP_EN is enabled, setting 1 to this bit indicates the module works in DMA mode. 0: Disable 1: Enable |
| 3 | / | / | / |
| 2 | R/W | 0x0 | CLK_CNT_SPL Sampling time for clk counter per frame 0: Sampling clock counter every frame done 1: Sampling clock counter every vsync |

| Offset:0x0000 | | | Register Name: CSIC_DMA_EN_REG |
|---------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 1 | R/W | 0x0 | CLK_CNT_EN clk count per frame enable |
| 0 | R/W | 0x0 | BK_TOP_EN 0: Disable 1: Enable |

6.1.8.2 0x0004 CSIC DMA Configuration Register (Default Value:0x0000_0000)

| Offset: 0x0004 | | | Register Name: CSIC_DMA_CFG_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:24 | R/W | 0x0 | PAD_VAL Padding value when OUTPUT_FMT is prgb888 0x00-0xff |
| 23:22 | / | / | / |
| 21 | R/W | 0x0 | YUV 10-bit input cut to 8-bit 0: Disable 1: Enable |
| 20 | R/W | 0x0 | YUV 10-bit store configuration 0: YUV 10-bit stored in low 10-bit of a 16-bit word 1: YUV 10-bit stored in high 10-bit of a 16-bit word |
| 19:16 | R/W | 0x0 | OUTPUT_FMT Output data format When the input format is set to RAW stream 0000: field-raw-8 0001: field-raw-10 0010: field-raw-12 0011: reserved 0100: field-rgb565 0101: field-rgb888 0110: field-prgb888 0111: reserved 1000: frame-raw-8 1001: frame-raw-10 1010: frame-raw-12 1011: reserved 1100: frame-rgb565 1101: frame-rgb888 1110: frame-prgb888 1111: reserved When the input format is set to YUV422 |

| 15:14 | / | / | / |
| 13 | R/W | 0x0 | VFLIP_EN Vertical flip enable When enabled, the received data will be arranged in vertical flip. 0: Disable 1: Enable |
| 12 | R/W | 0x0 | HFLIP_EN Horizontal flip enable When enabled, the received data will be arranged in horizontal flip. 0: Disable |

| Offset: 0x0004 | | | Register Name: CSIC_DMA_CFG_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| | | | 1: Enable |
| 11:10 | R/W | 0x0 | FIELD_SEL Field selection 00: Capturing with field 0 01: Capturing with field 1 10: Capturing with either field 11: Reserved |
| 9:6 | R/W | 0x0 | FPS_DS Fps down sample 0: no down sample 1: 1/2 fps, only receives the first frame every 2 frames 2: 1/3 fps, only receives the first frame every 3 frames 3: 1/4 fps, only receives the first frame every 4 frames 4: 1/5 fps, only receives the first frame every 4 frames 15: 1/16 fps, only receives the first frame every 16 frames |
| 5:2 | / | / | / |
| 1:0 | R/W | 0x0 | MIN_SDR_WR_SIZE Minimum size of SDRAM block write 00: 256 bytes (if hflip is enabled, always select 256 bytes) 01: 512 bytes 10: 1K bytes 11: 2K bytes |

6.1.8.3 0x0010 CSIC DMA Horizontal Size Register (Default Value:0x0500_0000)

| Offset: 0x0010 | | | Register Name: CSIC_DMA_HSIZE_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:29 | / | / | / |
| 28:16 | R/W | 0x500 | HOR_LEN When BK_TOP_EN is enabled, DMA_EN is enabled, these bits indicate Horizontal pixel unit length. Valid pixel of a line in DMA mode. |
| 15:13 | / | / | / |
| 12:0 | R/W | 0x0 | HOR_START Horizontal pixel unit start. Pixel is valid from this pixel. |

6.1.8.4 0x0014 CSIC DMA Vertical Size Register (Default Value:0x02D0_0000)

| Offset: 0x0014 | | | Register Name: CSIC_DMA_VSIZE_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:29 | / | / | / |
| 28:16 | R/W | 0x2D0 | VER_LEN When BK_TOP_EN is enabled, DMA_EN is enabled, these bits indicate Valid line number of a frame in DMA mode. |
| 15:13 | / | / | / |
| 12:0 | R/W | 0x0 | VER_START Vertical line start Data is valid from this line. |

6.1.8.5 0x0020 CSIC DMA FIFO 0 Output Buffer-A Address Register (Default Value:0x0000_0000)

| Offset: 0x0020 | | | Register Name: CSIC_DMA_F0_BUFA_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | FO_BUFA When BK_TOP_EN is enabled, FBC_EN is enabled, DMA_EN is disabled, these bits indicate output address of overhead data in FBC mode. When BK_TOP_EN is enabled, FBC_EN is disabled, DMA_EN is enabled, LBC_EN is disabled, these bits indicate FIFO 0 output buffer-A address in DMA mode. When BK_TOP_EN is enabled, FBC_EN is disabled, DMA_EN is enabled, LBC_EN is enabled, these bits indicate the output buffer address in LBC mode. |

6.1.8.6 0x0024 CSIC DMA FIFO 0 Output Buffer-A Address Result Register (Default Value:0x0000_0000)

| Offset: 0x0024 | | | Register Name: CSIC_DMA_F0_BUFA_RESULT_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | RO | 0x0 | FO_BUFA_RESULT Indicate the final FO_BUFA address used for DMA or FBC after software configuration or hardware calculation from Buffer-A address register or buffer address fifo. Only used for debug. |

6.1.8.7 0x0028 CSIC DMA FIFO 1 Output Buffer-A Address Register (Default Value:0x0000_0000)

| Offset: 0x0028 | | | Register Name: CSIC_DMA_F1_BUFA_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | <p>F1_BUFA</p> <p>When BK_TOP_EN is enabled, FBC_EN is enabled, DMA_EN is disabled, these bits indicate the output address of compressed data in FBC mode.</p> <p>When BK_TOP_EN is enabled, FBC_EN is disabled, DMA_EN is enabled, these bits indicate the FIFO 1 output buffer-A address in DMA mode.</p> |

6.1.8.8 0x002C CSIC DMA FIFO 1 Output Buffer-A Address Result Register (Default Value:0x0000_0000)

| Offset: 0x002C | | | Register Name: CSIC_DMA_F1_BUFA_RESULT_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | RO | 0x0 | <p>F1_BUFA_RESULT</p> <p>Indicate the final F1_BUFA address used for DMA or FBC after software configuration or hardware calculation from Buffer-A address register or buffer address fifo. Only used for debug.</p> |

6.1.8.9 0x0030 CSIC DMA FIFO 2 Output Buffer-A Address Register (Default Value:0x0000_0000)

| Offset: 0x0030 | | | Register Name: CSIC_DMA_F2_BUFA_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | <p>F2_BUFA</p> <p>FIFO 2 output buffer-A address.</p> |

6.1.8.10 0x0034 CSIC DMA FIFO 2 Output Buffer-A Address Result Register (Default Value:0x0000_0000)

| Offset: 0x0034 | | | Register Name: CSIC_DMA_F2_BUFA_RESULT_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | RO | 0x0 | <p>F2_BUFA_RESULT</p> <p>Indicate the final F2_BUFA address used for DMA or FBC after software configuration or hardware calculation from Buffer-A address register or buffer address fifo. Only used for debug.</p> |

6.1.8.11 0x0038 CSIC DMA Buffer Length Register (Default Value:0x0280_0500)

| Offset: 0x0038 | | | Register Name: CSIC_DMA_BUF_LEN_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:30 | / | / | / |
| 29:16 | R/W | 0x280 | BUF_LEN_C DMA_MODE: Buffer length of chroma C in a line. Unit is byte. LBC_MODE: Buffer length Stride of luminance Y in ONLY Y line. Unit is byte. Only Readable when BUF_LENGTH_CFG_MODE is set 0. |
| 15:14 | / | / | / |
| 13:0 | R/W | 0x500 | BUF_LEN DMA_MODE: Buffer length of luminance Y in a line. Unit is byte. LBC_MODE: Buffer length Stride of luminance Y and chroma C in YC line. Unit is byte. Only Readable when BUF_LENGTH_CFG_MODE is set 0. |

6.1.8.12 0x003C CSIC DMA Flip Size Register (Default Value:0x02D0_0500)

| Offset: 0x003C | | | Register Name: CSIC_DMA_FLIP_SIZE_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:29 | / | / | / |
| 28:16 | R/W | 0x2d0 | VER_LEN Vertical line number when in VFLIP mode. Unit is line. Only Readable when FLIP_SIZE_CFG_MODE is set to 0. |
| 15:14 | / | / | / |
| 13:0 | R/W | 0x500 | VALID_LEN Valid components of a line when in HFLIP mode. Unit is pixel component. Only Readable when FLIP_SIZE_CFG_MODE is set to 0. |

6.1.8.13 0x0040 CSIC DMA Video Input Timeout Threshold0 Register (Default Value:0x0000_0000)

| Offset: 0x0040 | | | Register Name: CSIC_DMA_VI_TO_TH0_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | Video Input Timeout Threshold0 Set VIDEO_INPUT_TO_INT_PD when VI Counter reaches TH0 after VI_TO_CNT_EN is set, the Time Unit is a 12M clock period. |

6.1.8.14 0x0044 CSIC DMA Video Input Timeout Threshold1 Register(Default Value:0x0000_0000)

| Offset: 0x0044 | | | Register Name: CSIC_DMA_VI_TO_TH1_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | Video Input Timeout Threshold1 Set VIDEO_INPUT_TO_INT_PD when VI Counter reaches TH1 after getting the first frame has been input, the Time Unit is a 12M clock period. |

6.1.8.15 0x0048 CSIC DMA Video Input Timeout Counter Value Register (Default Value:0x0000_0000)

| Offset: 0x0048 | | | Register Name: CSIC_DMA_VI_TO_CNT_VAL_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | Video Input Timeout Counter Value Indicate the current value of Video Input Timeout Counter |

6.1.8.16 0x004C CSIC DMA Capture Status Register (Default Value:0x0000_0000)

| Offset: 0x004C | | | Register Name: CSIC_DMA_CAP_STA_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:3 | / | / | / |
| 2 | R | 0x0 | FIELD_STA The status of the received field 0: Field 0 1: Field 1 |
| 1 | R | 0x0 | VCAP_STA Video capture in progress Indicates the CSI is capturing video image data (multiple frames). The bit is set at the start of the first frame after enabling video capture. When software disables video capture, it clears itself after the last pixel of the current frame is captured. |
| 0 | R | 0x0 | SCAP_STA Still capture in progress Indicates the CSI is capturing still image data (single frame). The bit is set at the start of the first frame after enabling still frame capture. It clears itself after the last pixel of the first frame is captured. For CCIR656 interface, if the output format is frame planar YCbCr 420 mode, the frame end means the field2 end, the other frame end means filed end. |

6.1.8.17 0x0050 CSIC DMA Interrupt Enable Register (Default Value:0x0000_0000)

| Offset: 0x0050 | | | Register Name: CSIC_DMA_INT_EN_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15 | R/W | 0x0 | FRM_LOST_INT_EN Set an INT when frame starts with empty Buffer Address FIFO, only use in BUF Address FIFO MODE. |
| 14 | R/W | 0x0 | STORED_FRM_CNT_INT_EN Set an INT when the value of CSIC_DMA_STORED_FRM_CNT reaches CSIC_DMA_STORED_FRM_THRESHOLD, only use in BUF Address FIFO MODE. |
| 13 | R/W | 0x0 | BUF_ADDR_FIFO_INT_EN Set an INT when content in BUF Address FIFO less than CSIC_DMA_BUFA_FIFO_THRESHOLD, only use in BUF Address FIFO MODE. |
| 12 | R/W | 0x0 | VIDEO_INPUT_TO_INT_EN Set an INT when no video input exceeds the setting threshold time |
| 11 | R/W | 0x0 | CLR_FRAME_CNT_INT_EN Set a INT when clear Frame cnt. |
| 10:8 | / | / | / |
| 7 | R/W | 0x0 | VS_INT_EN vsync flag The bit is set when vsync come. And at this time load the buffer address for the coming frame. So after this irq come, changing the buffer address could only effect next frame |
| 6 | R/W | 0x0 | HB_OF_INT_EN Hblank FIFO overflow The bit is set when 3 FIFOs still overflow after the hblank. |
| 5 | R/W | 0x0 | LC_INT_EN Line counter flag The bit is set when the specific line has been written to dram every frame. The line number is set in the line counter register. |
| 4 | R/W | 0x0 | FIFO2_OF_INT_EN FIFO 2 overflow The bit is set when the FIFO 2 became overflow. |
| 3 | R/W | 0x0 | FIFO1_OF_INT_EN FIFO 1 overflow The bit is set when the FIFO 1 became overflow. |
| 2 | R/W | 0x0 | FIFO0_OF_INT_EN FIFO 0 overflow The bit is set when the FIFO 0 became overflow. |
| 1 | R/W | 0x0 | FD_INT_EN |

| Offset: 0x0050 | | | Register Name: CSIC_DMA_INT_EN_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| | | | Frame done Indicates the CSI has finished capturing an image frame. Applies to video capture mode. The bit is set after each completed frame capturing data is written to buffer as long as video capture remains enabled. |
| 0 | R/W | 0x0 | CD_INT_EN Capture done Indicates the CSI has completed capturing the image data. For still capture, the bit is set when one frame data has been written to buffer. For video capture, the bit is set when the last frame has been written to buffer after video capture has been disabled. For CCIR656 interface, if the output format is frame planar YCbCr 420 mode, the frame end means the field2 end, the other frame end means field end. |

6.1.8.18 0x0054 CSIC DMA Interrupt Status Register (Default Value:0x0000_0000)

| Offset: 0x0054 | | | Register Name: CSIC_DMA_INT_STA_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15 | R/W1C | 0x0 | FRM_LOST_INT_PD Set an INT when frame starts with empty Buffer Address FIFO, only use in BUF Address FIFO MODE. |
| 14 | R/W1C | 0x0 | STORED_FRM_CNT_INT_PD Set an INT when the value of CSIC_DMA_STORED_FRM_CNT reaches CSIC_DMA_STORED_FRM_THRESHOLD, only use in BUF Address FIFO MODE. |
| 13 | R/W1C | 0x0 | BUF_ADDR_FIFO_INT_PD Set an INT when content in BUF Address FIFO less than CSIC_DMA_BUFA_FIFO_THRESHOLD, only use in BUF Address FIFO MODE. |
| 12 | R/W1C | 0x0 | VIDEO_INPUT_TO_INT_PD Set an INT Pending when no video input exceeds the setting threshold time. |
| 11 | R/W1C | 0x0 | CLR_FRAME_CNT_INT Set a INT when clear Frame cnt. |
| 10:8 | / | / | / |
| 7 | R/W1C | 0x0 | VS_PD vsync flag |
| 6 | R/W1C | 0x0 | LI_OF_PD |

| Offset: 0x0054 | | | Register Name: CSIC_DMA_INT_STA_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| | | | Line information FIFO (16 lines) overflow |
| 5 | R/W1C | 0x0 | LC_PD Line counter flag |
| 4 | R/W1C | 0x0 | FIFO2_OF_PD FIFO 2 overflow |
| 3 | R/W1C | 0x0 | FIFO1_OF_PD FIFO 1 overflow |
| 2 | R/W1C | 0x0 | FIFO0_OF_PD FIFO 0 overflow |
| 1 | R/W1C | 0x0 | FD_PD Frame done |
| 0 | R/W1C | 0x0 | CD_PD Capture done |

6.1.8.19 0x0058 CSIC DMA Line Counter Register (Default Value:0x0000_0000)

| Offset: 0x0058 | | | Register Name: CSIC_DMA_LINE_CNT_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:13 | / | / | / |
| 12:0 | R/W | 0x0 | LINE_CNT_NUM The LINE_CNT_NUM value is set by user,when internal line counter reach the set value, the LC_PD will be set. |

6.1.8.20 0x005C CSIC DMA Frame Counter Register (Default Value:0x0001_0000)

| Offset: 0x005C | | | Register Name: CSIC_DMA_FRM_CNT_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R/W1C | 0x0 | FRM_CNT_CLR When the bit set to 1, Frame cnt is cleared to 0. |
| 30:16 | R/W | 0x1 | PCLK_DMA_CLR_DISTANCE Frame cnt clear cycle $N * T_{SYNC}$ |
| 15:0 | R | 0x0 | FRM_CNT Counter value of frame. When frame done comes, the internal counter value add 1, and when the reg full, it is cleared to 0 . When parser sent a sync signal, it is cleared to 0. |

6.1.8.21 0x0060 CSIC DMA Frame Clock Counter Register (Default Value:0x0000_0000)

| Offset: 0x0060 | | | Register Name: CSIC_DMA_FRM_CLK_CNT_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:24 | / | / | / |
| 23:0 | R | 0x0 | FRM_CLK_CNT Counter value between every frame. For instant hardware frame rate statics. The internal counter is added by one every 12 MHz clock cycle. When frame done or vsync comes, the internal counter value is sampled to FRM_CLK_CNT, and cleared to 0. |

6.1.8.22 0x0064 CSIC DMA Accumulated and Internal Clock Counter Register (Default Value:0x0000_0000)

| Offset: 0x0064 | | | Register Name: CSIC_DMA_ACC_ITNL_CLK_CNT_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:24 | R/WC | 0x0 | ACC_CLK_CNT The accumulated value of FRM_CLK_CNT for software frame rate statics. Every interrupt of frame is done, the software checks this accumulated value and clears it to 0. If the ACC_CLK_CNT is larger than 1, the software has lost frame. When frame done or vsync comes, ACC_CLK_CNT = ACC_CLK_CNT + 1, and cleared to 0 when writing this register. |
| 23:0 | R | 0x0 | ITNL_CLK_CNT The instant value of internal frame clock counter. When frame done interrupt comes, the software can query this counter for judging whether it is the time for updating the double buffer address registers. |

6.1.8.23 0x0068 CSIC DMA FIFO Statistic Register (Default Value:0x0000_0000)

| Offset: 0x0068 | | | Register Name: CSIC_DMA_FIFO_STAT_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:30 | / | / | / |
| 29:16 | R | 0x0 | Line Index Indicates the line index in current vsync. |
| 15:13 | / | / | / |
| 12:0 | R | 0x0 | FIFO_FRM_MAX Indicates the maximum depth of FIFO being occupied for whole frame. Update at every vsync or framedone. |

6.1.8.24 0x006C CSIC DMA FIFO Threshold Register (Default Value:0x0000_0400)

| Offset: 0x006C | | | Register Name: CSIC_DMA_FIFO_THRS_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:12 | / | / | / |
| 11:0 | R/W | 0x400 | FIFO_THRS When FIFO occupied memory exceed the threshold, dram frequency can not change. |

6.1.8.25 0x0070 CSIC DMA PCLK Statistic Register (Default Value:0x0000_7FFF)

| Offset: 0x0070 | | | Register Name: CSIC_DMA_PCLK_STAT_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31 | / | / | / |
| 30:16 | R | 0x0 | PCLK_CNT_LINE_MAX Indicates maximum pixel clock counter value for each line. Update at every vsync or framedone. |
| 15 | / | / | / |
| 14:0 | R | 0x7FFF | PCLK_CNT_LINE_MIN Indicates minimum pixel clock counter value for each line. Update at every vsync or framedone. |

6.1.8.26 0x0080 CSIC DMA BUF Address FIFO0 Entry Register (Default Value:0x0000_0000)

| Offset: 0x0080 | | | Register Name: CSIC_DMA_BUF_ADDR_FIFO0_ENTRY_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | CSIC_DMA_BUF_ADDR_FIFO0_ENTRY FIFO Entry of Buffer Address FIFO0 for input frames to be stored, only used in Buffer Addr FIFO Mode |

6.1.8.27 0x0084 CSIC DMA BUF Address FIFO1 Entry Register (Default Value:0x0000_0000)

| Offset: 0x0084 | | | Register Name: CSIC_DMA_BUF_ADDR_FIFO1_ENTRY_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | CSIC_DMA_BUF_ADDR_FIFO1_ENTRY FIFO Entry of Buffer Address FIFO1 for input frames to be stored, only used in Buffer Addr FIFO Mode. |

6.1.8.28 0x0088 CSIC DMA BUF Address FIFO2 Entry Register (Default Value:0x0000_0000)

| Offset: 0x0088 | | | Register Name: CSIC_DMA_BUF_ADDR_FIFO2_ENTRY_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | CSIC_DMA_BUF_ADDR_FIFO2_ENTRY FIFO Entry of Buffer Address FIFO2 for input frames to be stored, only used in Buffer Addr FIFO Mode. |

6.1.8.29 0x008C CSIC DMA BUF Threshold Register (Default Value:0x0020_0000)

| Offset: 0x008C | | | Register Name: CSIC_DMA_BUF_TH_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:21 | / | / | / |
| 21:16 | R/W | 0x20 | CSIC_DMA_STORED_FRM_THRESHOLD when stored frame counter value reaches the threshold , counter is cleared to 0 , only used in Buffer Addr FIFO Mode. |
| 15:6 | / | / | / |
| 5:0 | R/W | 0x0 | CSIC_DMA_BUF_ADDR_FIFO_THRESHOLD when content in Buffer Address FIFO less than the threshold, an interrupt is set, only used in Buffer Addr FIFO Mode. |

6.1.8.30 0x0090 CSIC DMA BUF Address FIFO Content Register (Default Value:0x0000_0000)

| Offset: 0x0090 | | | Register Name: CSIC_DMA_BUF_ADDR_FIFO_CON_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:22 | / | / | / |
| 21:16 | RO | 0x0 | CSIC_DMA_BUF_ADDR_FIFO2_CONTENT FIFO Content of address buffered in Buffer Address FIFO2, only used in Buffer Addr FIFO Mode. |
| 15:14 | / | / | / |
| 13:8 | RO | 0x0 | CSIC_DMA_BUF_ADDR_FIFO1_CONTENT FIFO Content of address buffered in Buffer Address FIFO1, only used in Buffer Addr FIFO Mode. |
| 7:6 | / | / | / |
| 5:0 | RO | 0x0 | CSIC_DMA_BUF_ADDR_FIFO0_CONTENT FIFO Content of address buffered in Buffer Address FIFO0, only used in Buffer Addr FIFO Mode. |

6.1.8.31 0x0094 CSIC DMA Stored Frame Counter Register (Default Value:0x0000_0000)

| Offset: 0x0094 | | | Register Name: CSIC_DMA_STORED_FRM_CNT_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:8 | / | / | / |
| 7:0 | RO | 0x0 | CSIC_DMA_STORED_FRM_CNT Indicates value of stored frames counter. When the counter value reaches CSIC_DMA_STORED_FRM_THRESHOLD, the counter is cleared to 0. Only used in Buffer Addr FIFO Mode. |

6.1.8.32 0x01F4 CSIC DMA Feature List Register(Default Value:0x0000_0000)

| Offset: 0x01F4 | | | Register Name: CSIC_FEATURE_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:2 | / | / | / |
| 1 | R | 0x0 | DMA0_EMBEDDED_LBC 0: No Embedded LBC 1: Embedded LBC |
| 0 | R | 0x0 | DMA0_EMBEDDED_FBC 0: No Embedded DMA 1: Embedded FBC |

6.2 TV Decoder

6.2.1 Overview

The Television Decoder (TVD) is an interface that transforms Composite Video Broadcast Signal (CVBS) or component signal into YUV data.

Features:

- 2-channel CVBS input and 1-channel CVBS decoder
- CVBS input, NTSC and PAL supported
- Supports YUV422, YUV420 format
- With 1 channel 3D comb filter
- Detection for signal locked and 625 lines
- Programmable brightness, contrast, saturation
- 10-bit video ADCs

6.2.2 Block Diagram

Figure 6-8 shows a block diagram of the TVD.

Figure 6-8 TVD Block Diagram

6.2.3 Functional Description

6.2.3.1 External Signals

Table 6-3 describes the external signals of TVD.

Table 6-3 TVD External Signals

| Port Name | Description | Type |
|-----------|--|------|
| TVIN0 | TV CVBS Input 0 | AI |
| TVIN1 | TV CVBS Input 1 | AI |
| TVIN-VRP | TV CVBS ADC Positive Reference Voltage | P |
| TVIN-VRN | TV CVBS ADC Negative Reference Voltage | P |
| VCC-TVIN | TV CVBS ADC Power | P |

6.2.4 Register List

| Module Name | Base Address |
|-------------|--------------|
| TVD_TOP | 0x05C00000 |
| TVD0 | 0x05C01000 |

| Register Name | Offset | Description |
|----------------|-----------------------|-----------------------------------|
| TVD_TOP | | |
| TVD_TOP_MAP | 0x0000 | TVD TOP MAP Register |
| TVD_3D_CTL1 | 0x0008 | TVD 3D DMA CONTROL Register1 |
| TVD_3D_CTL2 | 0x000C | TVD 3D DMA CONTROL Register2 |
| TVD_3D_CTL3 | 0x0010 | TVD 3D DMA CONTROL Register3 |
| TVD_3D_CTL4 | 0x0014 | TVD 3D DMA CONTROL Register4 |

7 Memory

7.1 SDRAM Controller (DRAMC)

The DRAMC provides a simple, flexible, burst-optimized interface to all in-dusty-standard DDR2/DDR3 SDRAM. It supports up to a 16 Gbits memory address space.

The DRAMC automatically handles memory management, initialization, and refresh operations. It gives the host CPU a simple command interface, hiding details of the required address, page, and burst handling procedures. All memory parameters are runtime-configurable, including timing, memory setting, SDRAM type, and Extended-Mode-Register settings.

The DRAMC has the following features:

- Supports 16-bit one channel
- Supports 2 Chip Select
- Supports DDR2/DDR3 SDRAM
- Maximum capacity up to 2 GB
- Supports clock frequency up to 533 MHz for DDR2
- Supports clock frequency up to 800 MHz for DDR3

7.2 SD/MMC Host Controller (SMHC)

7.2.1 Overview

The SMHC controls the read/write operations on the secure digital (SD) cards, multimedia cards (MMC), and various extended devices that is based on the secure digital input/output (SDIO) protocol. The processor provides three SMHC interfaces for controlling the SD cards, MMCs, and SDIO devices.

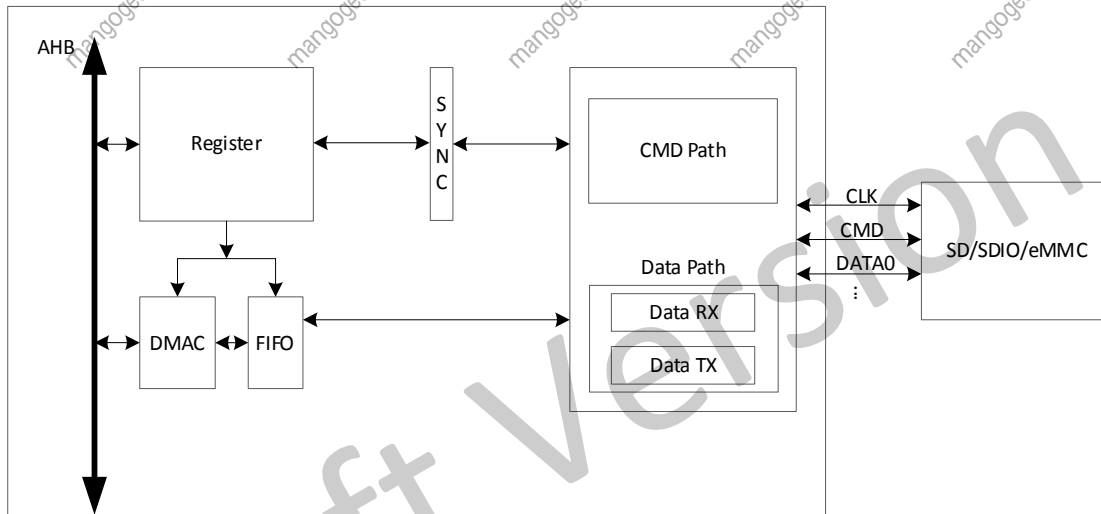

The SMHC has the following features:

- Supports Command Completion signals and interrupts to host processor, and Command Completion signal disable feature
- The SMHC0 controls the devices that comply with the Secure Digital Memory (SD mem-version 3.0)
- The SMHC1 controls the device that complies with the protocol Secure Digital I/O (SDIO-version 3.0)
- The SMHC2 controls the device that complies with the Multimedia Card (eMMC-version 5.0)
- Maximum performance:
 - SDR mode: 150 MHz@1.8 V IO pad
 - DDR mode: 100 MHz@1.8 V IO pad
 - DDR mode: 50 MHz@3.3 V IO pad
- Supports 1-bit or 4-bit data width
- Hardware CRC generation and error detection
- Programmable baud rate
- Supports SDIO interrupt in 1-bit and 4-bit modes
- Block size of 1 to 65535 bytes
- Descriptor-based internal DMA controller
- Internal 1 KB RXFIFO and 1 KB TXFIFO

7.2.2 Block Diagram

The following figure shows a block diagram of the SMHC.

Figure 7-1 SMHC Block Diagram

SMHC contains the following sub-blocks:

Table 7-1 SMHC Sub-blocks

| Sub-block | Description |
|-----------|---|
| Register | Used to configure the control signal for reading or writing the SD/SDIO/eMMC. |
| DMAC | The DMA controller that controls the data transfer between the memory and SMHC. |
| FIFO | A buffer for the data stream between the memory and the SMHC asynchronous clock domain. |
| SYNC | Synchronizes the signals from the AHB clock domain to the SMHC clock domain. |
| CMD Path | Sends commands to or receives commands from the SD/SDIO/eMMC. |
| Data Path | Consists of Data TX and Data RX sub-modules. The Data TX sends data blocks and the CRC codes to the SD/SDIO/eMMC. The Data RX receives data blocks and the CRC codes from the SD/SDIO/eMMC. |

7.2.3 Functional Description

7.2.3.1 External Signals

The following table describes the external signals of SMHC.

Table 7-2 SMHC External Signals

| Port Name | Type | Description |
|-------------|---------|--------------------------------------|
| SDC0-CMD | I/O, OD | Command Signal for SD Card |
| SDC0-CLK | O | Clock for SD Card |
| SDC0-D[3:0] | I/O | Data Input and Output for SD Card |
| SDC0-RST | O | Reset for SD Card |
| SDC1-CMD | I/O, OD | Command Signal for SDIO Wi-Fi |
| SDC1-CLK | O | Clock for SDIO Wi-Fi |
| SDC1-D[3:0] | I/O | Data Input and Output for SDIO Wi-Fi |
| SDC2-CMD | I/O, OD | Command Signal for eMMC |
| SDC2-CLK | O | Clock for eMMC |
| SDC2-D[3:0] | I/O | Data Input and Output for eMMC |

7.2.3.2 Clock Sources

The SMHC0/1 has 4 different clock sources. The SMHC2 has 5 different clock sources. You can select one of them as the SMHC clock source. The following table describes the clock sources of the SMHC.

For clock setting, configurations, and gating information, refer to section 3.2 “[CCU](#)”.

Table 7-3 SMHC0/1 Clock Sources

| Clock Sources | Description |
|------------------|--|
| HOSC | 24 MHz Crystal |
| PLL_PERI(1X) | Peripheral Clock, the default value is 600 MHz |
| PLL_PERI(2X) | Peripheral Clock, the default value is 1.2 GHz |
| PLL_AUDIO1(DIV2) | Audio clock, the default value is 1536 MHz |

Table 7-4 SMHC2 Clock Sources

| Clock Sources | Description |
|------------------|--|
| HOSC | 24 MHz Crystal |
| PLL_PERI(1X) | Peripheral Clock, the default value is 600 MHz |
| PLL_PERI(2X) | Peripheral Clock, the default value is 1.2 GHz |
| PLL_PERI(800M) | Peripheral Clock, the default value is 800 MHz |
| PLL_AUDIO1(DIV2) | Audio clock, the default value is 1536 MHz |

7.2.3.3 Timing Diagram

Refer to the following relative specifications:

- Physical Layer Specification Ver3.00 Final
- SDIO Specification Ver2.00
- Multimedia Cards (MMC – version 4.2)
- JEDEC Standard – JESD84-44, Embedded Multimedia Card (eMMC) Card Product Standard
- JEDEC Standard – JESD84-B45, Embedded Multimedia Card (eMMC) Electrical Standard (4.5 Device)
- JEDEC Standard – JESD84-B50, Embedded Multimedia Card (eMMC) Electrical Standard (5.0)

7.2.3.4 Data Path

The SMHC and SD/SDIO/eMMC contains the following interface buses: CLK, CMD, and DATA 1/4. During one clock cycle, the SMHC can transmit one bit command with one or two bits data in 1-ch DATA mode, or four or eight bits data in 4-ch DATA mode. The CMD is a bidirection channel for initializing the SD/SDIO/eMMC and transmitting commands. It can work in both the open-drain mode and push-pull mode. The DATA is also a bidirection channel. It works in the push-pull mode.

Reading Data from the SD/SDIO/eMMC

The register configures the signals for the read operation, and synchronize the signals to the SMHC clock domain. Then the Data RX reads data from the SD/SDIO/eMMC via the CLK/CMD/DATA interface buses and writes the data in the FIFO. After that, the DMAC transfers the data from the FIFO to the memory.

Writing Data to the SD/SDIO/eMMC

The register configures the signals for the write operation, and synchronize the signals to the SMHC clock domain. Then the DMAC reads data from the memory and writes the data to the FIFO. After that, the Data TX reads the data from the FIFO and writes the data to the SD/SDIO/eMMC via the CLK/CMD/DATA interface buses.

7.2.3.5 Package Format

Data transfer over the SD/eMMC bus is based on command and data bitstreams that are initiated by a start bit and terminated by a stop bit. There are three types of SD/eMMC packets: command token, response token, and data packet.

Command Tokens

The command token starts an operation. A command is sent from the host to a device. It is transferred serially on the CMD line. Command tokens have the following coding scheme:

Figure 7-2 Command Token Format

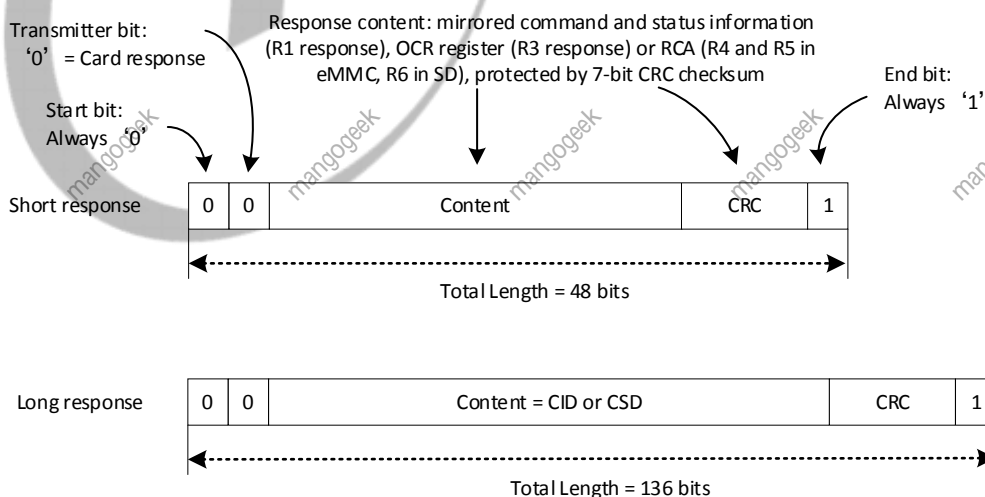

Each command token has 48 bits, preceded by a start bit ('0') and succeeded by an end bit ('1'). To detect transmission errors, each token is protected by CRC bits.

Response Tokens

After receiving a command, the card returns a 48-bit or 136-bit response based on the command type.

A response token is sent from the device to the host as an answer to a previously received command. It is transferred serially on the CMD line.

Figure 7-3 Response Token Format

Data Packets

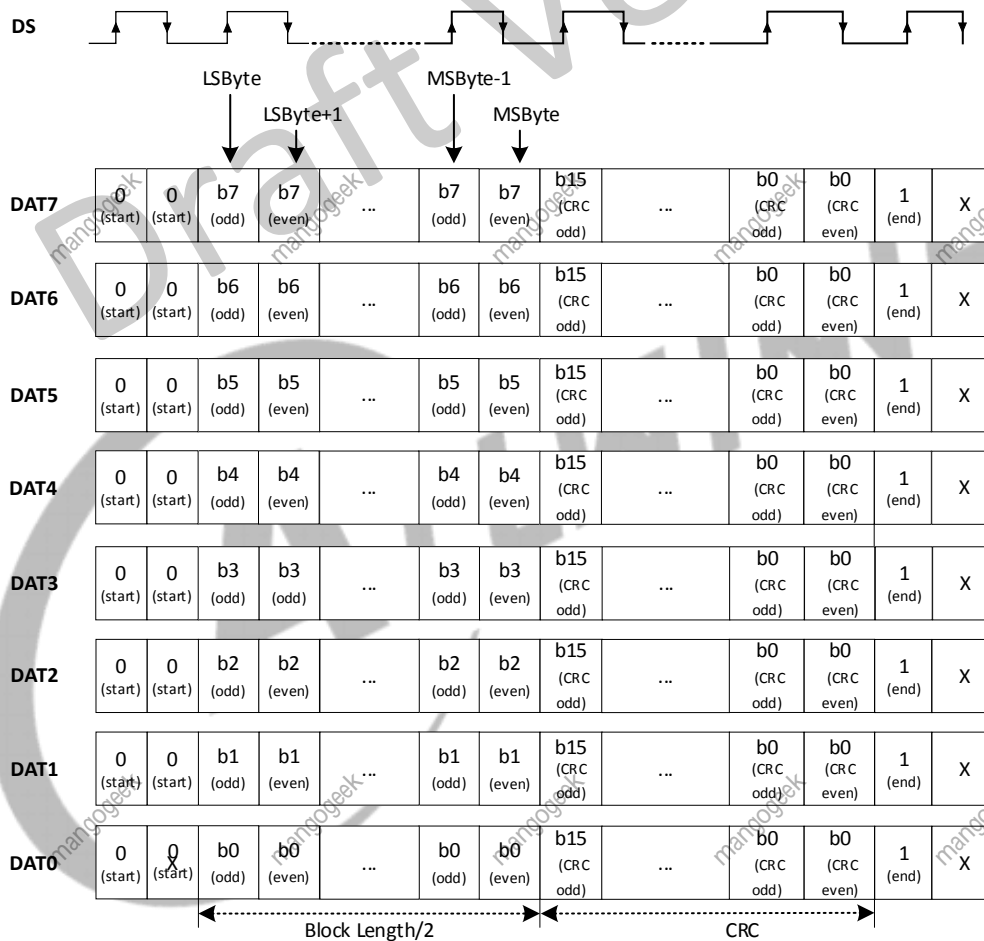

Data can be transferred from the device to the host or vice versa. Data are transferred via the data lines.

NOTE

- Bytes data are not interleaved but CRCs are interleaved.
- Start and end bits are only valid on the rising edge (“X” indicates “undefined”).

Figure 7-6 Data Packet Format for DDR in HS400 Mode

8 Bits Bus DDR for HS400 Output (DAT7 – DAT0 used)

NOTE

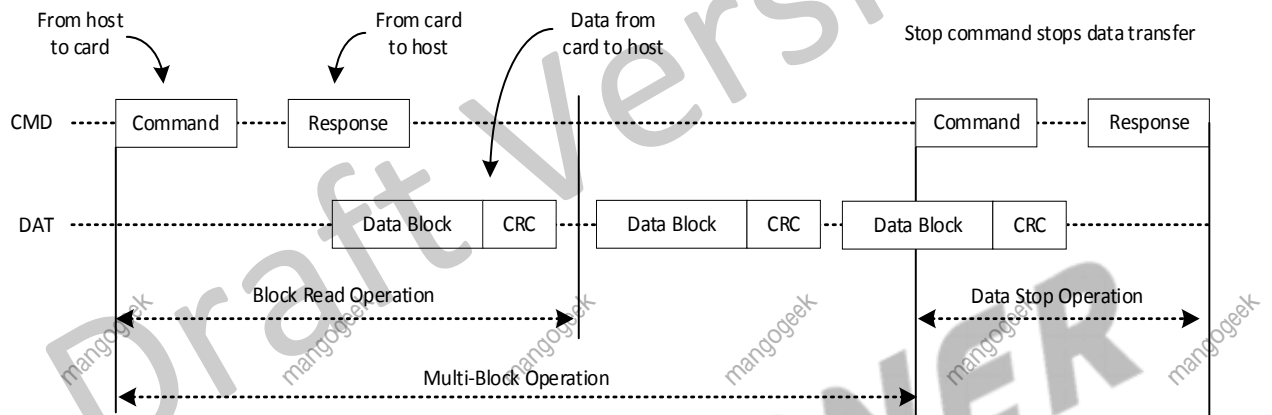

- Bytes data are not interleaved but CRCs are interleaved.
- Start bits are valid when Data Strobe is High and Low.
- End bits are only valid when Data Strobe is High (“X” indicates “undefined”).

7.2.3.6 Data Transfer

Data transfers to or from the SD/eMMC card are done in blocks. Single and multiple block operations are widely used during data transfer.

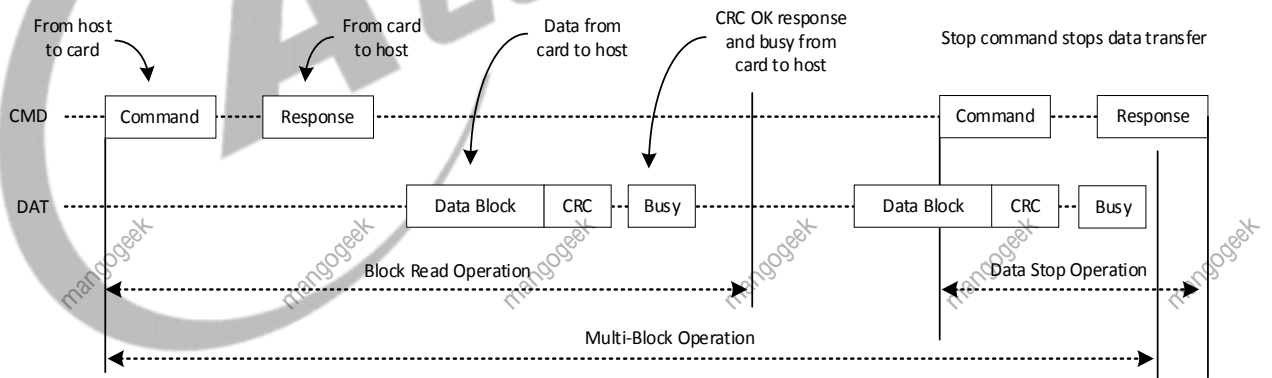

The following figure shows the single-block and multi-block read operation.

Figure 7-7 Single-Block and Multi-Block Read Operation

The following figure shows the single-block and multi-block write operation.

Figure 7-8 Single-Block and Multi-Block Read Operation

7.2.3.7 Bus Speed Modes

The following table shows the bus speed modes supported by SD 3.0.

Table 7-5 Speed Modes Supported by SD 3.0

| Mode | I/O Voltage | Bus Width | Frequency | Throughput |
|--------|-------------|-----------|--------------|---------------|
| SDR104 | 1.8 V | 1, 4 bits | 0 to 208 MHz | 0 to 104 MB/s |

| Mode | I/O Voltage | Bus Width | Frequency | Throughput |
|-------------------------|-------------|-----------|-------------|--------------|
| SDR50 | 1.8 V | 1, 4 bits | 0 to 100MHz | 0 to 50 MB/s |
| DDR50 | 1.8 V | 1, 4 bits | 0 to 50 MHz | 0 to 50 MB/s |
| SDR25 | 1.8 V | 1, 4 bits | 0 to 50 MHz | 0 to 25 MB/s |
| SDR12 | 1.8 V | 1, 4 bits | 0 to 25 MHz | 0 to 12 MB/s |
| High Speed Mode (HS) | 3.3 V | 1, 4 bits | 0 to 50 MHz | 0 to 25 MB/s |
| Default Speed Mode (DS) | 3.3 V | 1, 4 bits | 0 to 25 MHz | 0 to 12 MB/s |

The following table shows the bus speed modes supported by eMMC 5.0.

Table 7-6 Speed Modes Supported by eMMC 5.0

| Mode | Data Rate | I/O Voltage | Bus Width | Frequency | Throughput |
|--|-----------|-------------|--------------|--------------|---------------|
| Backwards Compatibility with legacy MMC card | Single | 3 V/1.8 V | 1, 4, 8 bits | 0 to 26 MHz | 0 to 26 MB/s |
| High Speed SDR | Single | 3 V/1.8 V | 1, 4, 8 bits | 0 to 52 MHz | 0 to 52 MB/s |
| High Speed DDR | Dual | 3 V/1.8 V | 4, 8 bits | 0 to 52 MHz | 0 to 104 MB/s |
| HS200 | Single | 1.8 V | 4, 8 bits | 0 to 200 MHz | 0 to 200 MB/s |
| HS400 | Dual | 1.8 V | 8 bits | 0 to 200 MHz | 0 to 400 MB/s |

NOTE

D1 does not support the bus width of 8 bits.

7.2.3.8 Phase Offset of the Command and Data

You can configure the phase offset of the command and data by the [SMHC_DRV_DL](#) register.

SDR Mode

The following figure shows the phase offset of SDR command and data.

Figure 7-9 Phase Offset of Command and Data in SDR Mode

Table 7-7 Phase Offset of Command and Data in SDR Mode

| Drive Delay | Command | Data |
|-------------|---|--|
| 0 | The command is updated in 90° clock position | The data is updated in 90° clock position |
| 1 | The command is updated in 180° clock position | The data is updated in 180° clock position |

DDR4 Mode

The following figure shows the phase offset of DDR4 command and data.

Figure 7-10 Phase Offset of Command and Data in DDR4 Mode (SMHC_NTSR[31] = 0)

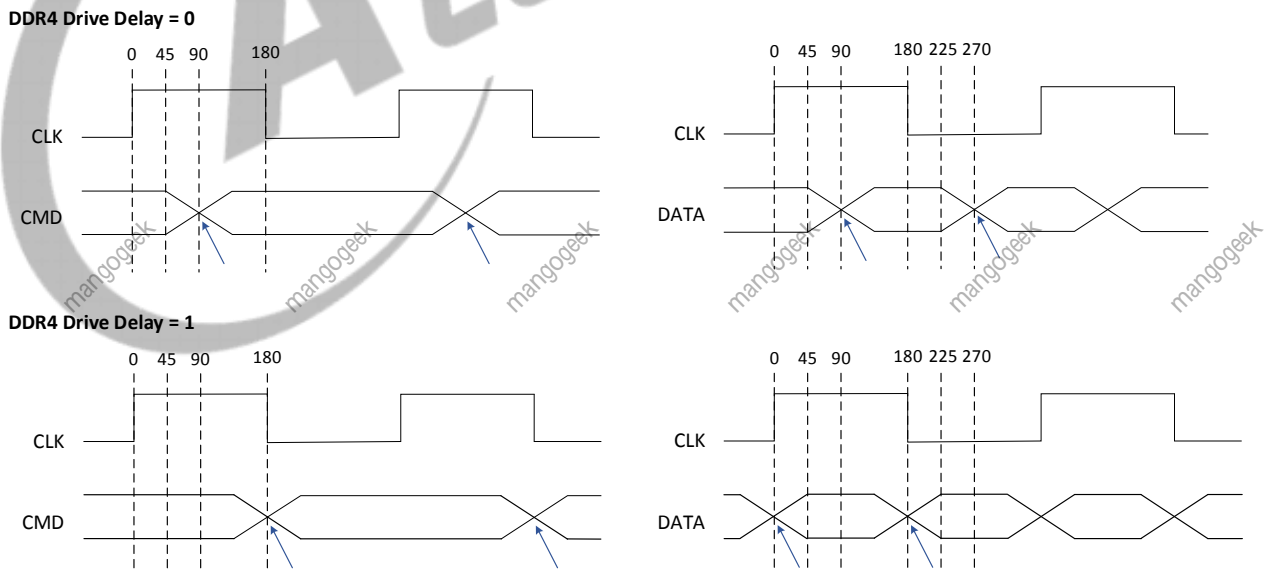

Figure 7-11 Phase Offset of Command and Data in DDR4 Mode

| Drive Delay | Command | Data |
|-------------|--|---|
| 0 | The command is updated in 90° clock position | The data is updated in 90° or 270° clock position |

| Drive Delay | Command | Data |
|-------------|---|--|
| 1 | The command is updated in 180° clock position | The data is updated in 0° or 180° clock position |

DDR4 (2x) Mode

The following figure shows the phase offset of DDR4 (2x mode) command and data.

Figure 7-12 Phase Offset of Command and Data in DDR4 (2x Mode) (SMHC NTSR[31] = 1)

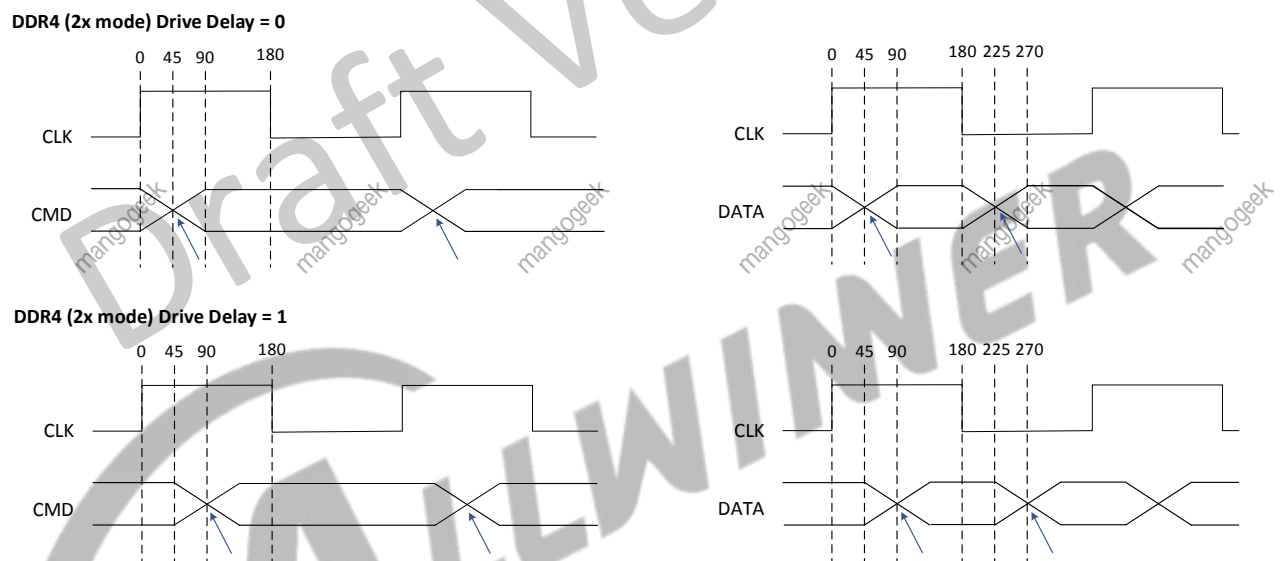

Table 7-8 Phase Offset of Command and Data in DDR4 (2x) Mode

| Drive Delay | Command | Data |
|-------------|--|---|
| 0 | The command is updated in 45° clock position | The data is updated in 45° or 225° clock position |
| 1 | The command is updated in 90° clock position | The data is updated in 90° or 270° clock position |

7.2.3.9 Internal DMA Controller Description

The SMHC has an internal DMA controller (IDMAC) to transfer data between the host memory and SMHC port. With a descriptor, the IDMAC can efficiently move data from the source to destination by automatically loading the next DMA transfer arguments, which needs less CPU intervention. Before transferring data in the IDMAC, the host driver should construct a descriptor list, configure arguments of every DMA transfer, and then launch the descriptor and start the DMA.

The IDMAC has an interrupt controller. When enabled, it generates an interrupt to the HOST CPU in situations such as data transmission is completed or some error is happened.

IDMAC Descriptor Structure

The IDMAC uses a descriptor with a chain structure, and each descriptor points to a unique buffer and the next descriptor.

The following figure shows the internal formats of a descriptor.

Figure 7-13 IDMAC Descriptor Structure Diagram

This figure illustrates the internal formats of a descriptor. The descriptor address must be aligned to the bus width used for 32-bit buses. Each descriptor contains 16 bytes of control and status information.

DES0 corresponds to the [31:0] bits, DES1 corresponds to the [63:32] bits, DES2 corresponds to the [95:64] bits, and DES3 corresponds the [127:96] bits in a descriptor.

The following table shows the bit definition of DES0.

Table 7-9 DES0 Definition

| Bits | Name | Description |
|------|----------------|--|
| 31 | HOLD | DES_OWN_FLAG When set to 1, this bit indicates that the descriptor is owned by the IDMAC. When this bit is reset, it indicates that the descriptor is owned by the host. This bit is cleared when the transfer is over. |
| 30 | ERROR | ERR_FLAG When some errors happen in transfer, this bit will be set to 1. |
| 29:5 | / | / |
| 4 | Chain Flag | CHAIN_MOD When set to 1, this bit indicates that the second address in the descriptor is the next descriptor address. It must be set to 1. |
| 3 | First DES Flag | FIRST_FLAG When set to 1, this bit indicates that this descriptor contains the first buffer of data. It must be set to 1 in the first DES. |

| Bits | Name | Description |
|------|---------------------------------|--|
| 2 | Last DES Flag | LAST_FLAG When set to 1, this bit indicates that the buffers this descriptor points to are the last data buffer. |
| 1 | Disable Interrupt on completion | CUR_TXRX_OVER_INT_DIS When set to 1, this bit will prevent the setting of the TX/RX interrupt bit of the IDMAC status register for data that ends in the buffer the descriptor points to. |
| 0 | / | / |

The following table shows the bit definition of DES1.

Table 7-10 DES1 Definition

| Bits | Name | Description |
|-------|-------------|---|
| 31:13 | / | / |
| 12:0 | Buffer size | BUFF_SIZE The bits indicate the data buffer byte size, which must be a multiple of 4 bytes. If this field is 0, the DMA ignores this buffer and proceeds to the next descriptor. |

The following table shows the bit definition of DES2.

Table 7-11 DES2 Definition

| Bits | Name | Descriptor |
|------|------------------------|---|
| 31:0 | Buffer address pointer | BUFF_ADDR The bits indicate the physical address of the data buffer. It is a word address. |

The following table shows the bit definition of DES3.

Table 7-12 DES3 Definition

| Bits | Name | Descriptor |
|------|-------------------------|--|
| 31:0 | Next descriptor address | NEXT_DESP_ADDR The bits indicate the pointer to the physical memory where the next descriptor is present. It is a word address. |

7.2.3.10 Calibrating the Delay Chain

There are two delay chains in SMHC: data strobe delay chain and sample delay chain.

Data strobe delay chain: used to generate delay to make proper timing between Data Strobe and data signals.

Sample delay chain: used to generate delay to make proper timing between the internal card clock signal and data signals.

Each delay chain is made up with 64 delay cells. The delay time of one delay cell can be estimated through delay chain calibration.

Follow the steps below to calibrate the delay chain:

- Step 1** Enable SMHC. In order to calibrate the delay chain by the operation registers in SMHC, the SMHC must be enabled through [SMHC Bus Gating Reset Register](#) and [SMHCx Clock Register](#).
- Step 2** Configure a proper clock for SMHC. The delay chain calibration is based on the clock for SMHC from Clock Control Unit (CCU). The delay chain calibration is an internal function in SMHC and needs no devices. So it is unnecessary to open the clock signal for devices. The recommended clock frequency is 200 MHz.
- Step 3** Set proper initial delay value. Writing 0xA0 to **delay control register** enables **Delay Software Enable** (bit[7]) and sets initial delay value 0x20 to **Delay chain** (bit[5:0]). Then write 0x0 to **delay control register** to clear the value.
- Step 4** Write 0x8000 to **delay control register** to start calibrating the delay chain.
- Step 5** Wait until the flag (bit14 in **delay control register**) of calibration done is set. The number of delay cells is shown at bit[13:8] in **delay control register**. The delay time generated by these delay cells is equal to the cycle of the SMHC clock nearly. This value is the result of calibration.
- Step 6** Calculate the delay time of one delay cell according to the cycle of the SMHC clock and the result of calibration.

7.2.4 Programming Guidelines

7.2.4.1 Initializing SMHC

Before data and commands are exchanged between a card and the SMHC, the SMHC needs to be initialized. Follow the steps below to initialize the SMHC:

- Step 1** Configure the corresponding GPIO register as an SMHC by Port Controller module; reset clock by writing 1 to [SMHC_BGR_REG](#)[SMHCx_RST], and open clock gating by writing 1 to

[SMHC_BGR_REG](#)[SMHCx_GATING]; select clock sources and set the division factor by configuring the [SMHCx_CLK_REG](#) (x = 0, 1) register.

- Step 2** Configure [SMHC_CTRL](#) to reset the FIFO and controller, and enable the global interrupt; configure [SMHC_INTMASK](#) to 0xFFCE to enable normal interrupts and error abnormal interrupts, and then register the interrupt function.
- Step 3** Configure [SMHC_CLKDIV](#) to open clock for devices; configure [SMHC_CMD](#) as the change clock command (for example 0x80202000); send the update clock command to deliver clocks to devices.
- Step 4** Configure [SMHC_CMD](#) as a normal command. Configure [SMHC_CMDARG](#) to set command parameters. Configure [SMHC_CMD](#) to set parameters like whether to send the response, the response type, and the response length and then send the commands. According to the initialization process in the protocol, you can finish SMHC initialization by sending the corresponding command one by one.

7.2.4.2 Writing a Single Data Block

To write a single data block, follow the steps below:

- Step 1** Write 0x1 to [SMHC_CTRL](#)[DMA_RST] to reset the internal DMA controller; write 0x82 to [SMHC_IDMAC](#) to enable the IDMAC interrupt and configure AHB master burst transfers; configure [SMHC_IDIE](#) to enable the transfer interrupt, receive interrupt, and abnormal interrupt.
- Step 2** Configure [SMHC_FIFOTH](#) to determine the burst size and TX/RX trigger level. For example, if [SMHC_FIFOTH](#) is configured as 0x300F00F0, it indicates the burst size is 16, TX_TL is 15, and RX_TL is 240. Configure [SMHC_DLBA](#) to determine the start address of the DMA descriptor.
- Step 3** To write one block data to sector1, configure [SMHC_BYTCNT](#)[BYTE_CNT] to 0x200 and configure the descriptor according to the data size; set the data sector address of CMD24 (Single Data Block Write) to 0x1, write 0x80002758 to [SMHC_CMD](#), and send CMD24 command to write data to the device.
- Step 4** Check whether [SMHC_RINTSTS](#)[CC] is 1. If yes, the command is sent successfully; otherwise, continue to wait until timeout, and then exit the process.
- Step 5** Check whether [SMHC_IDST](#)[TX_INT] is 1. If yes, the data transfer for writing DMA is completed. Write 0x337 to [SMHC_IDST](#) to clear the interrupt flag. Otherwise, continue to wait until timeout, and then exit the process.
- Step 6** Check whether [SMHC_RINTSTS](#)[DTC] is 1. If yes, the data transfer and CMD24 writing operations are completed. Otherwise, abnormality exists. Read [SMHC_RINTSTS](#) and [SMHC_STATUS](#) to query the existing abnormality.
- Step 7** Send CMD13 command to query whether the device writing operation is completed and returns to the idle status. For example, device RCA is 0x1234, first set [SMHC_CMDARG](#) to 0x12340000, write 0x8000014D to [SMHC_CMD](#), go to step4 to ensure command transfer completed, and then check

whether the highest bit of [SMHC_RESP0](#) (CMD13 response) is 1. If yes, the device is in the idle status, and the next command can be sent. Otherwise, the device is in the busy status. Continue to send CMD13 to wait for the device to enter the idle status until timeout.

7.2.4.3 Reading a Single Data Block

To read a single data block, follow the steps below:

- Step 1** Write 0x1 to [SMHC_CTRL](#)[DMA_RST] to reset the internal DMA controller; write 0x82 to [SMHC_IDMAC](#) to enable the IDMAC interrupt and configure AHB master burst transfers; configure [SMHC_IDIE](#) to enable the transfer interrupt, receive interrupt, and abnormal interrupt.
- Step 2** Configure [SMHC_FIFOTH](#) to determine the burst size and TX/RX trigger level. For example, if [SMHC_FIFOTH](#) is configured as 0x300F00F0, it indicates the burst size is 16, TX_TL is 15, and RX_TL is 240. Configure [SMHC_DLBA](#) to determine the start address of the DMA descriptor.
- Step 3** To read one block data from sector1, configure [SMHC_BYTCNT](#)[BYTE_CNT] to 0x200 and configure the descriptor according to the data size; set the data sector address of CMD17 command (Single Data Block Read) to 0x1, write 0x80002351 to [SMHC_CMD](#), and send CMD17 command to read data from the device to DRAM/SRAM.
- Step 4** Check whether [SMHC_RINTSTS](#)[CC] is 1. If yes, the command is sent successfully; otherwise, continue to wait until timeout, and then exit the process.
- Step 5** Check whether [SMHC_IDST](#)[RX_INT] is 1. If yes, the data transfer for writing DMA is completed. Write 0x337 to [SMHC_IDST](#) to clear the interrupt flag. Otherwise, continue to wait until timeout, and then exit the process.
- Step 6** Check whether [SMHC_RINTSTS](#)[DTC] is 1. If yes, data transfer and CMD17 reading operation are completed. Otherwise, abnormality exists. Read [SMHC_RINTSTS](#) and [SMHC_STATUS](#) to query the existing abnormality.

7.2.4.4 Writing Open-Ended Multiple Data Blocks (CMD25 + Auto CMD12)

To write open-ended multiple data blocks, follow the steps below:

- Step 1** Write 0x1 to [SMHC_CTRL](#)[DMA_RST] to reset the internal DMA controller; write 0x82 to [SMHC_IDMAC](#) to enable the IDMAC interrupt and configure AHB master burst transfers; configure [SMHC_IDIE](#) to enable the transfer interrupt, receive interrupt, and abnormal interrupt.

- Step 2** Configure [SMHC_FIFOTH](#) to determine the burst size and TX/RX trigger level. For example, if [SMHC_FIFOTH](#) is configured as 0x300F00F0, it indicates the burst size is 16, TX_TL is 15, and RX_TL is 240. Configure [SMHC_DLBA](#) to determine the start address of the DMA descriptor.
- Step 3** To write three blocks of data to sectors begin with sector0, configure [SMHC_BYTCNT](#)[BYTE_CNT] to 0x600 and configure the descriptor according to the data size; set the data sector address of CMD25 command (Multiple Data Blocks Write) to 0x0, write 0x80003759 to [SMHC_CMD](#), and send CMD25 command to read data from the device to DRAM/SRAM.
- Step 4** Check whether [SMHC_RINTSTS](#)[CC] is 1. If yes, the command is sent successfully; otherwise, continue to wait until timeout, and then exit the process.
- Step 5** Check whether [SMHC_IDST](#)[RX_INT] is 1. If yes, the data transfer for writing DMA is completed. Write 0x337 to [SMHC_IDST](#) to clear the interrupt flag. Otherwise, continue to wait until timeout, and then exit the process.
- Step 6** Check whether [SMHC_RINTSTS](#)[ACD] and [SMHC_RINTSTS](#)[DTC] are both 1. If yes, the data transfer, CMD12 transfer, and CMD25 writing operations are completed. Otherwise, abnormality exists. Read [SMHC_RINTSTS](#) and [SMHC_STATUS](#) to query the existing abnormality.
- Step 7** Send CMD13 command to query whether the device writing operation is completed and returns to the idle status. For example, device RCA is 0x1234, first set [SMHC_CMDARG](#) to 0x12340000, write 0x8000014D to [SMHC_CMD](#), go to step4 to ensure command transfer completed, and then check whether the highest bit of [SMHC_RESP0](#) (CMD13 response) is 1. If yes, the device is in the idle status, and the next command can be sent. Otherwise, the device is in the busy status. Continue to send CMD13 to wait for the device to enter the idle status until timeout.

7.2.4.5 Reading Open-Ended Multiple Data Blocks (CMD18 + Auto CMD12)

To read open-ended multiple data blocks, follow the steps below:

- Step 1** Write 0x1 to [SMHC_CTRL](#)[DMA_RST] to reset the internal DMA controller; write 0x82 to [SMHC_IDMAC](#) to enable the IDMAC interrupt and configure AHB master burst transfers; configure [SMHC_IDIE](#) to enable the transfer interrupt, receive interrupt, and abnormal interrupt.
- Step 2** Configure [SMHC_FIFOTH](#) to determine the burst size and TX/RX trigger level. For example, if [SMHC_FIFOTH](#) is configured as 0x300F00F0, it indicates the burst size is 16, TX_TL is 15, and RX_TL is 240. Configure [SMHC_DLBA](#) to determine the start address of the DMA descriptor.
- Step 3** To read three blocks of data from sectors begin with sector0, configure [SMHC_BYTCNT](#)[BYTE_CNT] to 0x600 and configure the descriptor according to the data size; set the data sector address of CMD18 command (Multiple Data Blocks Read) to 0x0, write 0x80003352 to [SMHC_CMD](#), and send CMD18

command to read data to the device. When the data transfer is completed, CMD12 will be sent automatically.

- Step 4** Check whether [SMHC_RINTSTS](#)[CC] is 1. If yes, the command is sent successfully; otherwise, continue to wait until timeout, and then exit the process.
- Step 5** Check whether [SMHC_IDST](#)[RX_INT] is 1. If yes, the data transfer for writing DMA is completed. Write 0x337 to [SMHC_IDST](#) to clear the interrupt flag. Otherwise, continue to wait until timeout, and then exit the process.
- Step 6** Check whether [SMHC_RINTSTS](#)[ACD] and [SMHC_RINTSTS](#)[DTC] are both 1. If yes, data transfer, CMD12 transfer, and CMD18 reading operation are completed. Otherwise, abnormality exists. Read [SMHC_RINTSTS](#) and [SMHC_STATUS](#) to query the existing abnormality.

7.2.4.6 Writing Pre-Defined Multiple Data Blocks (CMD23 + CMD25)

To write pre-defined multiple data blocks, follow the steps below:

- Step 1** Write 0x1 to [SMHC_CTRL](#)[DMA_RST] to reset the internal DMA controller; write 0x82 to [SMHC_IDMAC](#) to enable the IDMAC interrupt and configure AHB master burst transfers; configure [SMHC_IDIE](#) to enable the transfer interrupt, receive interrupt, and abnormal interrupt.
- Step 2** Configure [SMHC_FIFOTH](#) to determine the burst size and TX/RX trigger level. For example, if [SMHC_FIFOTH](#) is configured as 0x300F00F0, it indicates the burst size is 16, TX_TL is 15, and RX_TL is 240. Configure [SMHC_DLBA](#) to determine the start address of the DMA descriptor.
- Step 3** To write three blocks of data, configure [SMHC_CMDARG](#) to 0x3 to specify the number of data blocks as three. Then write 0x80000157 to [SMHC_CMD](#) to send the CMD23 command. Check whether [SMHC_RINTSTS](#)[CC] is 1. If yes, the command is sent successful; otherwise, continue to wait until timeout, and then exit the process.
- Step 4** Configure [SMHC_BYTCNT](#)[BYTE_CNT] to 0x600 and configure the descriptor according to the data size; set the data sector address of CMD25 command (Multiple Data Blocks Write) to 0x0, write 0x80002759 to [SMHC_CMD](#), and send CMD25 command to write data to the device.
- Step 5** Check whether [SMHC_RINTSTS](#)[CC] is 1. If yes, the command is sent successful; otherwise, continue to wait until timeout, and then exit the process.
- Step 6** Check whether [SMHC_IDST](#)[TX_INT] is 1. If yes, the data transfer for writing DMA is completed. Write 0x337 to [SMHC_IDST](#) to clear the interrupt flag. Otherwise, continue to wait until timeout, and then exit the process.
- Step 7** Check whether [SMHC_RINTSTS](#)[DTC] is 1. If yes, the data transfer and CMD25 writing operations are completed. Otherwise, abnormality exists. Read [SMHC_RINTSTS](#) and [SMHC_STATUS](#) to query the existing abnormality.

Step 8 Send CMD13 command to query whether the device writing operation is completed and returns to the idle status. For example, device RCA is 0x1234, first set [SMHC_CMDARG](#) to 0x12340000, write 0x8000014D to [SMHC_CMD](#), go to step4 to ensure command transfer completed, and then check whether the highest bit of [SMHC_RESP0](#) (CMD13 response) is 1. If yes, the device is in the idle status, and the next command can be sent. Otherwise, the device is in the busy status. Continue to send CMD13 to wait for the device to enter the idle status until timeout.

7.2.4.7 Reading Pre-Defined Multiple Data Blocks (CMD23 + CMD18)

To read pre-defined multiple data blocks, follow the steps below:

- Step 1** Write 0x1 to [SMHC_CTRL](#)[DMA_RST] to reset the internal DMA controller; write 0x82 to [SMHC_IDMAC](#) to enable the IDMAC interrupt and configure AHB master burst transfers; configure [SMHC_IDIE](#) to enable the transfer interrupt, receive interrupt, and abnormal interrupt.
- Step 2** Configure [SMHC_FIFOTH](#) to determine the burst size and TX/RX trigger level. For example, if [SMHC_FIFOTH](#) is configured as 0x300F00F0, it indicates the burst size is 16, TX_TL is 15, and RX_TL is 240. Configure [SMHC_DLBA](#) to determine the start address of the DMA descriptor.
- Step 3** To read three blocks of data, configure [SMHC_CMDARG](#) to 0x3 to specify the number of data blocks as three. Then write 0x80000157 to [SMHC_CMD](#) to send the CMD23 command. Check whether [SMHC_RINTSTS](#)[CC] is 1. If yes, the command is sent successful; otherwise, continue to wait until timeout, and then exit the process.
- Step 4** Configure [SMHC_BYTCNT](#)[BYTE_CNT] to 0x600 and configure the descriptor according to the data size; set the data sector address of CMD18 (Multiple Data Blocks Read) to 0x0, write 0x80002352 to [SMHC_CMD](#), and send CMD18 command to read data from device to DRAM/SRAM.
- Step 5** Check whether [SMHC_RINTSTS](#)[CC] is 1. If yes, the command is sent successful; otherwise, continue to wait until timeout, and then exit the process.
- Step 6** Check whether [SMHC_IDST](#)[TX_INT] is 1. If yes, the data transfer for writing DMA is completed. Write 0x337 to [SMHC_IDST](#) to clear the interrupt flag. Otherwise, continue to wait until timeout, and then exit the process.
- Step 7** Check whether [SMHC_RINTSTS](#)[DTC] is 1. If yes, the data transfer and CMD18 writing operations are completed. Otherwise, abnormality exists. Read [SMHC_RINTSTS](#) and [SMHC_STATUS](#) to query the existing abnormality.

7.2.5 Register List

| Module Name | Base Address |
|-------------|--------------|
| SMHC0 | 0x04020000 |
| SMHC1 | 0x04021000 |
| SMHC2 | 0x04022000 |

| Register Name | Offset | Description |
|---------------|--------|--|
| SMHC_CTRL | 0x0000 | Control Register |
| SMHC_CLKDIV | 0x0004 | Clock Control Register |
| SMHC_TMOUT | 0x0008 | Time Out Register |
| SMHC_CTYPE | 0x000C | Bus Width Register |
| SMHC_BLKSIZE | 0x0010 | Block Size Register |
| SMHC_BYTCNT | 0x0014 | Byte Count Register |
| SMHC_CMD | 0x0018 | Command Register |
| SMHC_CMDARG | 0x001C | Command Argument Register |
| SMHC_RESP0 | 0x0020 | Response 0 Register |
| SMHC_RESP1 | 0x0024 | Response 1 Register |
| SMHC_RESP2 | 0x0028 | Response 2 Register |
| SMHC_RESP3 | 0x002C | Response 3 Register |
| SMHC_INTMASK | 0x0030 | Interrupt Mask Register |
| SMHC_MINTSTS | 0x0034 | Masked Interrupt Status Register |
| SMHC_RINTSTS | 0x0038 | Raw Interrupt Status Register |
| SMHC_STATUS | 0x003C | Status Register |
| SMHC_FIFOTH | 0x0040 | FIFO Water Level Register |
| SMHC_FUNS | 0x0044 | FIFO Function Select Register |
| SMHC_TBCNT | 0x0048 | Transferred Byte Count between Controller and Card |
| SMHC_TBBCNT | 0x004C | Transferred Byte Count between Host Memory and Internal FIFO |
| SMHC_DBGC | 0x0050 | Current Debug Control Register |
| SMHC_CSDC | 0x0054 | CRC Status Detect Control Registers |
| SMHC_A12A | 0x0058 | Auto Command 12 Argument Register |
| SMHC_NTSR | 0x005C | SD New Timing Set Register |
| SMHC_HWRST | 0x0078 | Hardware Reset Register |
| SMHC_IDMAC | 0x0080 | IDMAC Control Register |

| Register Name | Offset | Description |
|-------------------|--------|--|
| SMHC_DLBA | 0x0084 | Descriptor List Base Address Register |
| SMHC_IDST | 0x0088 | IDMAC Status Register |
| SMHC_IDIE | 0x008C | IDMAC Interrupt Enable Register |
| SMHC_THLD | 0x0100 | Card Threshold Control Register |
| SMHC_SFC | 0x0104 | Sample FIFO Control Register |
| SMHC_A23A | 0x0108 | Auto Command 23 Argument Register |
| EMMC_DDR_SBIT_DET | 0x010C | eMMC4.5 DDR Start Bit Detection Control Register |
| SMHC_EXT_CMD | 0x0138 | Extended Command Register |
| SMHC_EXT_RESP | 0x013C | Extended Response Register |
| SMHC_DRV_DL | 0x0140 | Drive Delay Control Register |
| SMHC_SMAP_DL | 0x0144 | Sample Delay Control Register |
| SMHC_DS_DL | 0x0148 | Data Strobe Delay Control Register |
| SMHC_HS400_DL | 0x014C | HS400 Delay Control Register |
| SMHC_FIFO | 0x0200 | Read/Write FIFO |

7.2.6 Register Description

7.2.6.1 0x0000 SMHC Global Control Register (Default Value: 0x0000_0100)

| Offset: 0x0000 | | | Register Name: SMHC_CTRL |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R/W | 0x0 | FIFO_AC_MOD FIFO Access Mode 0: DMA bus 1: AHB bus |
| 30:13 | / | / | / |
| 12 | R/W | 0x0 | TIME_UNIT_CMD Time unit for command line The time unit is used to calculate the command line time out value defined in RTO_LMT. 0: 1 card clock period 1: 256 card clock period |

| Offset: 0x0000 | | | Register Name: SMHC_CTRL |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 11 | R/W | 0x0 | <p>TIME_UNIT_DAT</p> <p>Time unit for data line</p> <p>Time unit is used to calculate the data line time out value defined in DTO_LMT.</p> <p>0: 1 card clock period</p> <p>1: 256 card clock period</p> |
| 10 | R/W | 0x0 | <p>DDR_MOD_SEL</p> <p>DDR Mode Select</p> <p>Although the HS400 speed mode of eMMC is 8-bit DDR, this field should be cleared when HS400_MD_EN is set.</p> <p>0: SDR mode</p> <p>1: DDR mode</p> |
| 9 | / | / | / |
| 8 | R/W | 0x1 | <p>CD_DBC_ENB</p> <p>Card Detect (Data[3] status) De-bounce Enable</p> <p>0: Disable de-bounce</p> <p>1: Enable de-bounce</p> |
| 7:6 | / | / | / |
| 5 | R/W | 0x0 | <p>DMA_ENB</p> <p>DMA Global Enable</p> <p>0: Disable DMA to transfer data via AHB bus</p> <p>1: Enable DMA to transfer data</p> |
| 4 | R/W | 0x0 | <p>INT_ENB</p> <p>Global Interrupt Enable</p> <p>0: Disable interrupts</p> <p>1: Enable interrupts</p> |
| 3 | / | / | / |
| 2 | R/W | 0x0 | <p>DMA_RST</p> <p>DMA Reset</p> |
| 1 | R/W | 0x0 | <p>FIFO_RST</p> <p>FIFO Reset</p> <p>0: No effect</p> <p>1: Reset the FIFO</p> <p>This bit is auto-cleared after the completion of the reset operation.</p> |

| Offset: 0x0000 | | | Register Name: SMHC_CTRL |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 0 | R/W | 0x0 | <p>SOFT_RST</p> <p>Software Reset</p> <p>0: No effect</p> <p>1: Reset SD/MMC controller</p> <p>This bit is auto-cleared after the completion of reset operation.</p> |

7.2.6.2 0x0004 SMHC Clock Control Register (Default Value: 0x0000_0000)

| Offset: 0x0004 | | | Register Name: SMHC_CLKDIV |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R/W | 0x0 | <p>MASK_DATA0</p> <p>0: Do not mask data0 when update clock</p> <p>1: Mask data0 when update clock</p> |
| 30:18 | / | / | / |
| 17 | R/W | 0x0 | <p>CCLK_CTRL</p> <p>Card Clock Output Control</p> <p>0: Card clock is always on.</p> <p>1: Turn off card clock when FSM is in IDLE state.</p> |
| 16 | R/W | 0x0 | <p>CCLK_ENB</p> <p>Card Clock Enable</p> <p>0: Card Clock is off.</p> <p>1: Card Clock is on.</p> |
| 15:8 | / | / | / |
| 7:0 | R/W | 0x0 | <p>CCLK_DIV</p> <p>Card Clock Divider</p> <p>n: Source clock is divided by 2*n. (n = 0 to 255)</p> <p>When HS400_MD_EN is set, this field must be cleared.</p> |

7.2.6.3 0x0008 SMHC Timeout Register (Default Value: 0xFFFF_FF40)

| Offset: 0x0008 | | | Register Name: SMHC_TMOUT |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:8 | R/W | 0xffff | <p>DTO_LMT Data Timeout Limit</p> <p>This field can set the time that the host waits for the data from the device.</p> <p>Ensure to communicate with the device, this field must be set to the maximum that is greater than the time N_{AC}.</p> <p>About the N_{AC}, the explanation is as follows:</p> <p>When Host read data, data transmission from the Device starts after the access time delay N_{AC} beginning from the end bit of the read command (ACMD51, CMD8, CMD17, and CMD18).</p> <p>When the host reads multiple block (CMD18), a next block's data transmission from the Device starts after the access time delay N_{AC} beginning from the end bit of the previous block.</p> <p>When the host writes data, the value is no effect.</p> |
| 7:0 | R/W | 0x40 | <p>RTO_LMT Response Timeout Limit</p> |

7.2.6.4 0x000C SMHC Bus Width Register (Default Value: 0x0000_0000)

| Offset: 0x000C | | | Register Name: SMHC_CTYPE |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:2 | / | / | / |
| 1:0 | R/W | 0x0 | <p>CARD_WID Card Width</p> <p>00: 1-bit width 01: 4-bit width 1x: 8-bit width</p> |

7.2.6.5 0x0010 SMHC Block Size Register (Default Value: 0x0000_0200)

| Offset: 0x0010 | | | Register Name: SMHC_BLKSIZE |
|----------------|------------|-------------|-----------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |

| Offset: 0x0010 | | | Register Name: SMHC_BLKSIZE |
|----------------|------------|-------------|-----------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 15:0 | R/W | 0x200 | BLK_SZ Block Size |

7.2.6.6 0x0014 SMHC Byte Count Register (Default Value: 0x0000_0200)

| Offset: 0x0014 | | | Register Name: SMHC_BYTCNT |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x200 | BYTE_CNT Byte counter The number of bytes to be transferred. It must be integer multiple of Block Size (BLK_SZ) for block transfers. |

7.2.6.7 0x0018 SMHC Command Register (Default Value: 0x0000_0000)

| Offset: 0x0018 | | | Register Name: SMHC_CMD |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R/W | 0x0 | CMD_LOAD Start Command This bit is automatically cleared when the current command is sent. If there is no response error happens, a command complete interrupt bit (CMD_OVER) will be set in the interrupt register. Do not write any other commands until this bit is cleared. |
| 30:29 | / | / | / |
| 28 | R/W | 0x0 | VOL_SW Voltage Switch 0: Normal command 1: Voltage switch command, set for CMD11 only. |
| 27 | R/W | 0x0 | BOOT_ABT Boot Abort Setting this bit will terminate the boot operation. |

| Offset: 0x0018 | | | Register Name: SMHC_CMD |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 26 | R/W | 0x0 | <p>EXP_BOOT_ACK</p> <p>Expect Boot Acknowledge</p> <p>When the software sets this bit along in mandatory boot operation, the controller expects a boot acknowledge start pattern of 0-1-0 from the selected card.</p> |
| 25:24 | R/W | 0x0 | <p>BOOT_MOD</p> <p>Boot Mode</p> <p>00: Normal command</p> <p>01: Mandatory Boot operation</p> <p>10: Alternate Boot operation</p> <p>11: Reserved</p> |
| 23:22 | / | / | / |
| 21 | R/W | 0x0 | <p>PRG_CLK</p> <p>Change Clock</p> <p>0: Normal command</p> <p>1: Change Card Clock</p> <p>When this bit is set, the controller will change the clock domain and clock output. No commands will be sent.</p> |
| 20:16 | / | / | / |
| 15 | R/W | 0x0 | <p>SEND_INIT_SEQ</p> <p>Send Initialization</p> <p>0: Normal command sending</p> <p>1: Send initialization sequence before sending this command.</p> |
| 14 | R/W | 0x0 | <p>STOP_ABT_CMD</p> <p>Stop Abort Command</p> <p>0: Normal command sending</p> <p>1: Send <i>Stop</i> or <i>Abort</i> command to stop the current data transfer in progress. (CMD12, CMD52 for writing "I/O Abort" in SDIO CCCR)</p> |
| 13 | R/W | 0x0 | <p>WAIT_PRE_OVER</p> <p>Wait for Data Transfer Over</p> <p>0: Send command at once, does not care about data transferring.</p> <p>1: Wait for data transfer completion before sending the current command.</p> |

| Offset: 0x0018 | | | Register Name: SMHC_CMD |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 12 | R/W | 0x0 | <p>STOP_CMD_FLAG</p> <p>Send Stop CMD Automatically (CMD12)</p> <p>0: Do not send stop command at the end of the data transfer.</p> <p>1: Send stop command automatically at the end of the data transfer.</p> <p>If set, the SMHC_RESP1 will record the response of auto CMD12.</p> |
| 11 | R/W | 0x0 | <p>TRANS_MODE</p> <p>Transfer Mode</p> <p>0: Block data transfer command</p> <p>1: Stream data transfer command</p> |
| 10 | R/W | 0x0 | <p>TRANS_DIR</p> <p>Transfer Direction</p> <p>0: Read operation</p> <p>1: Write operation</p> |
| 9 | R/W | 0x0 | <p>DATA_TRANS</p> <p>Data Transfer</p> <p>0: Without data transfer</p> <p>1: With data transfer</p> |
| 8 | R/W | 0x0 | <p>CHK_RESP_CRC</p> <p>Check Response CRC</p> <p>0: Do not check response CRC</p> <p>1: Check response CRC</p> |
| 7 | R/W | 0x0 | <p>LONG_RESP</p> <p>Response Type</p> <p>0: Short Response (48 bits)</p> <p>1: Long Response (136 bits)</p> |
| 6 | R/W | 0x0 | <p>RESP_RCV</p> <p>Response Receive</p> <p>0: Command without response</p> <p>1: Command with response</p> |
| 5:0 | R/W | 0x0 | <p>CMD_IDX</p> <p>CMD Index</p> <p>Command index value</p> |

7.2.6.8 0x001C SMHC Command Argument Register (Default Value: 0x0000_0000)

| Offset: 0x001C | | | Register Name: SMHC_CMDARG |
|----------------|------------|-------------|-----------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | CMD_ARG Command argument |

7.2.6.9 0x0020 SMHC Response 0 Register (Default Value: 0x0000_0000)

| Offset: 0x0020 | | | Register Name: SMHC_RESP0 |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | CMD_RESP0 Response 0 Bit[31:0] of response |

7.2.6.10 0x0024 SMHC Response 1 Register (Default Value: 0x0000_0000)

| Offset: 0x0024 | | | Register Name: SMHC_RESP1 |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | CMD_RESP1 Response 1 Bit[63:31] of response |

7.2.6.11 0x0028 SMHC Response 2 Register (Default Value: 0x0000_0000)

| Offset: 0x0028 | | | Register Name: SMHC_RESP2 |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | CMD_RESP2 Response 2 Bit[95:64] of response |

7.2.6.12 0x002C SMHC Response 3 Register (Default Value: 0x0000_0000)

| Offset: 0x002C | | | Register Name: SMHC_RESP3 |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | CMD_RESP3 Response 3 Bit[127:96] of response |

7.2.6.13 0x0030 SMHC Interrupt Mask Register (Default Value: 0x0000_0000)

| Offset: 0x0030 | | | Register Name: SMHC_INTMASK |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R/W | 0x0 | CARD_REMOVAL_INT_EN Card Removed Interrupt Enable |
| 30 | R/W | 0x0 | CARD_INSERT_INT_EN Card Inserted Interrupt Enable |
| 29:17 | / | / | / |
| 16 | R/W | 0x0 | SDIO_INT_EN SDIO Interrupt Enable |
| 15 | R/W | 0x0 | DEE_INT_EN Data End-bit Error Interrupt Enable |
| 14 | R/W | 0x0 | ACD_INT_EN Auto Command Done Interrupt Enable |

8.1 I2S/PCM

8.1.1 Overview

The I2S/PCM controller is designed to transfer streaming audio-data between the system memory and the codec chip. The controller supports standard I2S format, Left-justified mode format, Right-justified mode format, PCM mode format, and TDM mode format.

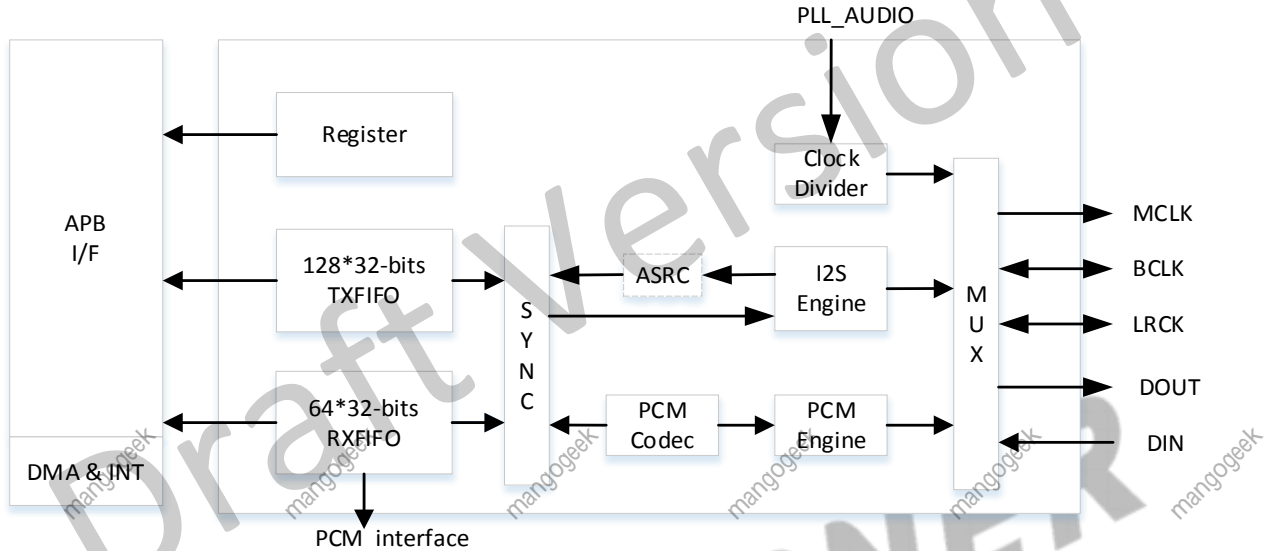

The I2S/PCM controller includes the following features:

- Three I2S/PCM external interfaces (I2S0, I2S1, I2S2) for connecting external power amplifier and MIC ADC
- Compliant with standard Philips Inter-IC sound (I2S) bus specification
 - Left-justified, Right-justified, PCM mode, and Time Division Multiplexing (TDM) format
 - Programmable PCM frame width: 1 BCLK width (short frame) and 2 BCLKs width (long frame)
- Transmit and Receive data FIFOs
 - Programmable FIFO thresholds
 - 128 depth x 32-bit width TXFIFO and 64 depth x 32-bit width RXFIFO
- Supports multiple function clock
 - Clock up to 24.576 MHz Data Output of I2S/PCM in Master mode (Only if the IO PAD and Peripheral I2S/PCM satisfy Timing Parameters)
 - Clock up to 12.288 MHz Data Input of I2S/PCM in Master mode
- Supports TX/RX DMA Slave interface
- Supports multiple application scenarios
 - Up to 16 channels (fs = 48 kHz) which has adjustable width from 8-bit to 32-bit
 - Sample rate from 8 kHz to 384 kHz (CHAN = 2)
 - 8-bits u-law and 8-bits A-law companded sample
- Supports master/slave mode

8.1.2 Block Diagram

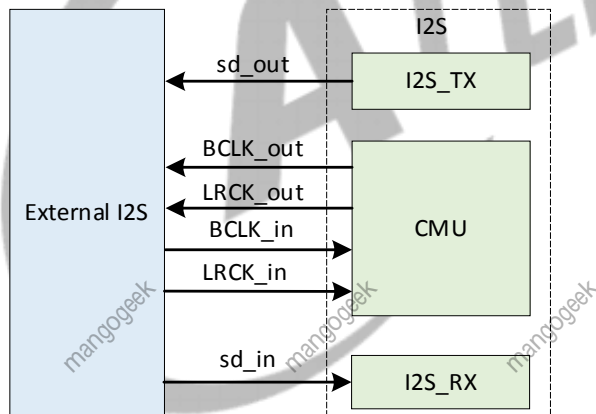

The following figure shows the functional block diagram of the I2S/PCM interface.

Figure 8-1 I2S/PCM Interface System Block Diagram

The following figure shows the typical application of the I2S/PCM interface.

Figure 8-2 Typical Application of I2S/PCM Interface

The I2S/PCM interface system integrates one I2S_TX and one I2S_RX.

- The I2S_TX is for playing music in I2S or PCM format.
- The I2S_RX is for receiving data in I2S or PCM format.
- When the I2S works in the master mode, the external I2S module provides BCLK_in and LRCK_in for the clock management unit (CMU), and the I2S_TX and I2S_RX work with the two external clocks.
- When the I2S works in the slave mode, the CMU provides clocks BCLK_out and LRCK_out for the external I2S module, and the I2S_TX and I2S_RX work with the internal clocks.

8.1.3 Functional Description

8.1.3.1 External Signals

The following table describes the external signals of the I2S/PCM interface.

LRCK and BCLK are bidirectional I/O. When the I2S/PCM interface works in the Master mode, LRCK and BCLK are output pins. When the I2S/PCM interface works in the Slave mode, LRCK and BCLK are input pins.

MCLK is an output pin for external devices. DOUT are the serial data output pins and DIN are the serial data input pins. For details about General Purpose I/O port, refer to section 9.7 “GPIO”.

Table 8-1 I2S/PCM External Signals

| Signal Name | Description | Type |
|----------------|--|------|
| I2S0-MCLK | I2S0 Master Clock | O |
| I2S0-LRCK | I2S0/PCM0 Sample Rate Clock/Sync | I/O |
| I2S0-BCLK | I2S0/PCM0 Sample Rate Clock | I/O |
| I2S0-DOUT[3:0] | I2S0/PCM0 Serial Data Output Channel [3:0] | O |
| I2S0-DIN[3:0] | I2S0/PCM0 Serial Data Input Channel [3:0] | I |
| I2S1-MCLK | I2S1 Master Clock | O |
| I2S1-LRCK | I2S1/PCM1 Sample Rate Clock/Sync | I/O |
| I2S1-BCLK | I2S1/PCM1 Sample Rate Clock | I/O |
| I2S1-DOUT[1:0] | I2S1/PCM1 Serial Data Output Channel [1:0] | O |
| I2S1-DIN[1:0] | I2S1/PCM1 Serial Data Input Channel [1:0] | I |
| I2S2-MCLK | I2S2 Master Clock | O |
| I2S2-LRCK | I2S2/PCM2 Sample Rate Clock/Sync | I/O |
| I2S2-BCLK | I2S2/PCM2 Sample Rate Clock | I/O |
| I2S2-DOUT[3:0] | I2S2/PCM2 Serial Data Output Channel [3:0] | O |
| I2S2-DIN[3:0] | I2S2/PCM2 Serial Data Input Channel [3:0] | I |

8.1.3.2 Clock Sources

The following table describes the clock sources for I2S/PCM. For clock setting, configurations, and gating information, refer to section 3.2 “CCU”.

Table 8-2 I2S/PCM Clock Sources

| Clock Name | Description |
|----------------|-------------|
| PLL_AUDIO0(1X) | |

| Clock Name | Description |
|------------------|--|
| PLL_AUDIO0(4X) | By default, PLL_AUDIO0(1X) is 24.5714 MHz, and PLL_AUDIO0(4X) is 98.2856 MHz. |
| PLL_AUDIO1(DIV2) | By default, PLL_AUDIO1 is 3072 MHz, PLL_AUDIO1(DIV2) is 1536 MHz, and PLL_AUDIO1(DIV5) is 614.4 MHz (24.576 MHz*25). |
| PLL_AUDIO1(DIV5) | |

8.1.3.3 Timing Diagram

The I2S/PCM supports standard I2S mode, Left-justified I2S mode, Right-justified I2S mode, PCM mode, and TDM mode. The software can select the modes by setting [I2S/PCM_CTL](#). The following figures describe the waveforms for SYNC, BCLK, DOUT, and DIN in different modes.

Each sampling period contains an LRCK. The low level of LRCK is the left channel corresponding to the even slots, and the high level is the right channel corresponding to the odd slots. Each slot is the sampling point of a mono channel. The sampling period can support the transmission of 2/4/8/16 slots. The BCLK corresponds to the serial data bit.

Figure 8-3 I2S Standard Mode Timing

Figure 8-4 Left-Justified Mode Timing

Figure 8-5 Right-Justified Mode Timing

Figure 8-6 PCM Long Frame Mode Timing

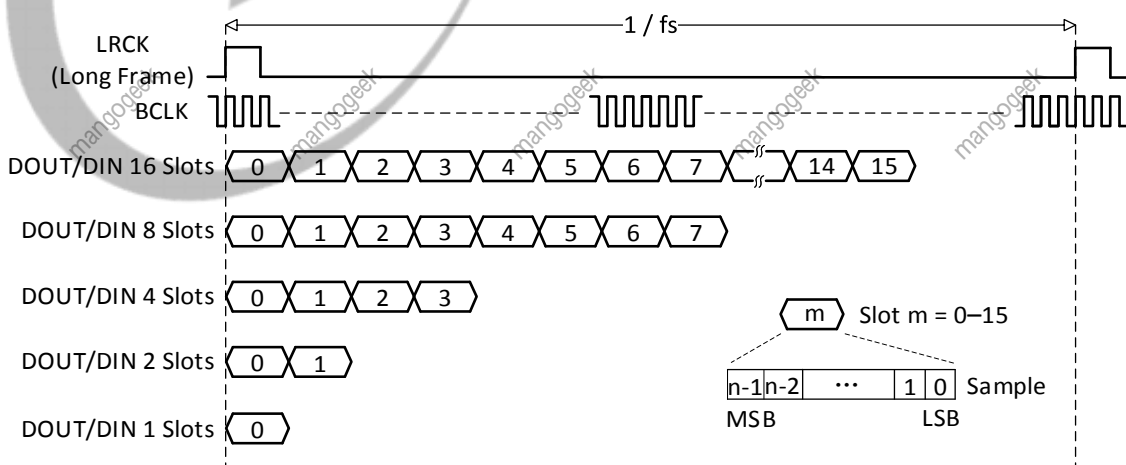

Figure 8-7 PCM Short Frame Mode Timing

8.1.3.4 DIN Slot Mapping

The 4-wire DIN has 64 slots, each wire DIN has 16 slots. However, only 16 slots are valid and act as the RX channels.

The following table shows the relationship between the slot id and encoder.

Table 8-3 DIN Slot ID and Encoder

| | | | | | | | | | | | | | | | | |
|---------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| DIN0 Slot ID | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 |
| DIN1 Slot ID | 16 | 17 | 18 | 19 | 20 | 21 | 22 | 23 | 24 | 25 | 26 | 27 | 28 | 29 | 30 | 31 |
| DIN2 Slot ID | 32 | 33 | 34 | 35 | 36 | 37 | 38 | 39 | 40 | 41 | 42 | 43 | 44 | 45 | 46 | 47 |
| DIN3 Slot ID | 48 | 49 | 50 | 51 | 52 | 53 | 54 | 55 | 56 | 57 | 58 | 59 | 60 | 61 | 62 | 63 |

There are 16 channels mapping configuration, each wire selects four slots for RX. The following figure shows the 16-channel mapping configuration.

Figure 8-8 16-Channel Mapping Configuration

8.1.3.5 ASRC

The ASRC module supports sampling rate conversion between the up-sampling and down-sampling. The ASRC also supports sampling rate conversion between dual-channel audio data, and the size of the sampling data is up to 24 bits.

The ASRC module has the following features:

- Typical THD + N: -130 dB (Range: -125 dB to -139 dB)
- Supports sampling rate conversion between the up-sampling and down-sampling to implement the sampling rate conversion for stereo data
 - The up-sampling ratio ranges from 1 to 7.5x
 - The down-sampling ratio ranges from 8 to 1x
- Supports sampling rate conversion between two identical frequencies
- Sampling rate for both the input and output range is from 8 kHz to 192 kHz and can be decimal
- Sampling rate can be configured manually or via adaptive generation
- The ASRC input is connected to I2S RX_FIFO_WDATA [31:8], and the input data is 24-bit MSB big-endian. For the input data that is less than 24 bits, use zeros to pad out the values at the low bits instead of high bits
- The ASRC needs some time to calculate the result. The output outsamplea/b will keep 0 during the calculation, and then change to the valid value when the result comes out

Calculating the ASRC Latency

Calculate the ASRC up-sampling and down-sampling latency according to the following formulas.

$$\text{Upsampling Latency} = \text{Phase Delay} + \text{FIFO Delay} = 32 + 16 = 48 \text{ Input Sample Periods}$$

$$\text{Downsampling Latency} = \text{Phase Delay} + \text{FIFO Delay} = (32 * f_{\text{sout}} / f_{\text{sin}}) + 16 \text{ Input Sample Periods}$$

ASRC Timing

The MCLK samples the input clock CLKIN to generate pulse signals.

The following figure shows the timing requirements for the inputs.

Figure 8-9 Timing Requirements for Inputs

The following figure shows the timing requirements for the outputs.

Figure 8-10 Timing Requirements for Outputs

For the up-sampling, $F_{MCLK} = F_{\text{sout}} * 1350$.

For the down-sampling, $F_{MCLK} = F_{\text{sin}} * 0.30 + F_{\text{sout}} * 295$.

The following table provides the proper values of MCLK in MHz with different Fsin and Fsout in kHz.

Table 8-4 Proper MCLK Values with Different Fsin and Fsout

| Fsin \ Fsout | 32 | 44.1 | 48 | 88.2 | 96 | 144 | 192 |
|--------------|-----|------|-----|------|-----|-----|-----|
| 32 | 45 | 60 | 65 | 120 | 130 | 195 | 260 |
| 44.1 | 55 | 60 | 65 | 120 | 130 | 195 | 260 |
| 48 | 60 | 65 | 65 | 120 | 130 | 195 | 260 |
| 88.2 | 105 | 105 | 110 | 120 | 130 | 195 | 260 |

| | | | | | | | |
|--------------------------------------|-----|------|-----|------|-----|-----|-----|
| F _{sout} \ F _{sin} | 32 | 44.1 | 48 | 88.2 | 96 | 144 | 192 |
| 96 | 110 | 115 | 115 | 125 | 130 | 195 | 260 |
| 144 | 160 | 165 | 165 | 175 | 180 | 195 | 260 |
| 192 | 210 | 215 | 215 | 225 | 230 | 245 | 260 |

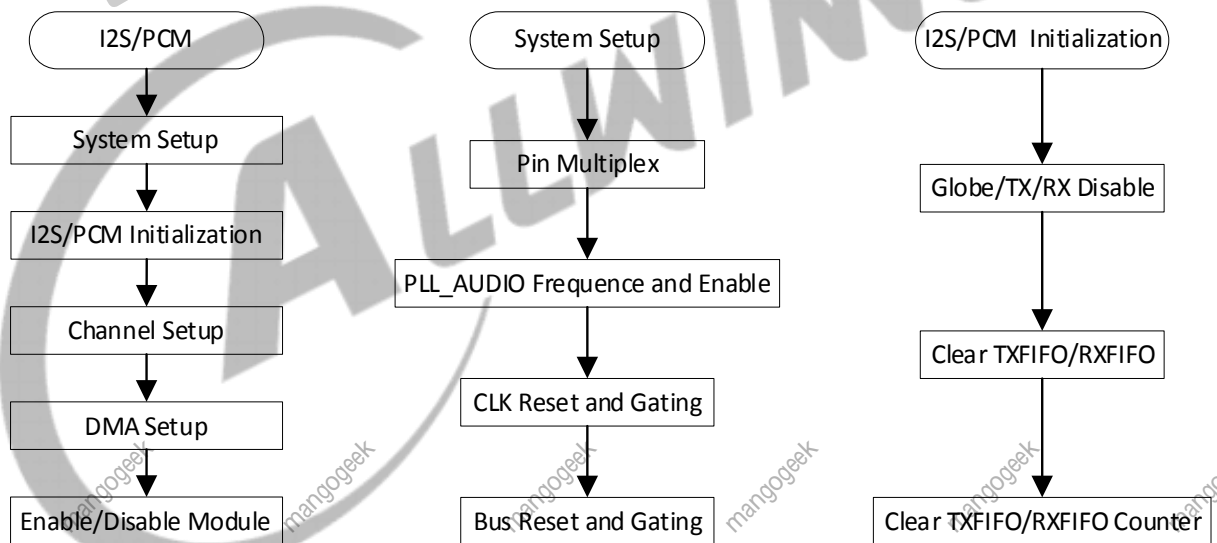

Note: The units for F_{sin} and F_{sout} are kHz and MCLK is MHz.

8.1.3.6 Operation Modes

The software operation of the I2S/PCM is divided into five steps: system setup, I2S/PCM initialization, the channel setup, DMA setup, and Enable/Disable module.

The following figure shows the whole operation flow of I2S/PCM.

Figure 8-11 I2S/PCM Operation Flow

1. System Setup and I2S/PCM Initialization

The clock source for the I2S/PCM should be followed. Firstly, disable the PLL_AUDIO through [PLL_AUDIOx Control Register](#)[PLL_ENABLE] in the CCU. Secondly, set up the frequency of the PLL_AUDIO in the [PLL_AUDIOx Control Register](#). After that, enable the I2S/PCM gating through the [I2S/PCMx CLK REG](#) when you checkout that the [PLL_AUDIOx Control Register](#)[LOCK] becomes to 1. At last, reset and enable the I2S/PCM bus gating by setting [I2S/PCM_BGR_REG](#).

After the system setup, the register of I2S/PCM can be setup. Firstly, initialize the I2S/PCM. You should close the Globe Enable bit ([I2S/PCM_CTL](#)[0]), Transmitter Block Enable bit ([I2S/PCM_CTL](#)[2]), and Receiver

Block Enable bit ([I2S/PCM CTL\[1\]](#)) by writing 0. After that, clear the TX/RX FIFO by writing 0 to the bit[25:24] of [I2S/PCM FCTL](#). At last, you can clear the TX FIFO and RX FIFO counter by writing 0 to [I2S/PCM TXCNT](#) and [I2S/PCM RXCNT](#).

2. Channel Setup and DMA Setup

First, you can set up the I2S/PCM of master and slave. The configuration can be referred to the protocol of I2S/PCM. Then, you can set up the translation mode, the sample resolution, the wide of the slot, the channel slot number, and the trigger level, and so on. The setup of the register can be found in the specification.

The I2S/PCM supports two methods to transfer the data. The most common way is DMA, the setup of DMA can be found in the “[DMA](#)”. In this module, you just enable the DRQ.

3. Enable and Disable I2S/PCM

To enable the function, you can enable TX/RX by writing [I2S/PCM CTL\[TXEN\]](#)/[I2S/PCM CTL\[RXEN\]](#). After that, enable I2S/PCM by writing 1 to [I2S/PCM CTL\[Globe Enable\]](#). Write 0 to the Globe Enable bit to disable I2S/PCM.

8.1.4 Programming Guidelines

8.1.4.1 Application Example of Processing ASRC Input and Output Data

The following example shows a typical application of ASRC: the input data is 24-bit valid, and the output data is a 32-bit data whose highest 24 bits are valid output and the lowest eight bits are padded out with zeros.

To implement the application, configure the sample resolution and slot width as 32 bits. Follow the steps below:

Step 1 For the input register: 0x04 [6:4] sample_res = 3`h7, 0x04 [2:0] slot_width = 3`h7.

The format of the input data: 32`hXXXXXXXX, where, bit[31] is the MSB and X is the valid data bit.

Step 2 For the output register: 0x04 [6:4] sample_res = 3`h7, 0x04 [2:0] slot_width = 3`h7

The format of the output data: 32`hXXXXXXXX00, where, bit[31] is the MSB, X is the valid data bit, and bit[7:0] are the padded zeros.

8.1.4.2 Converting the Sampling Rate with ASRC

Converting a 48 kHz sampling rate to 16 kHz is the most common scenario in actual applications. Follow the steps below to convert the sampling rate from 48 kHz to 16 kHz for the 32-bit data.

1. Configure the PLL_AUDIO Register

- a) Configure the [PLL_AUDIO1_CTRL_REG](#)[31:0] as 0x8814AB01. That is, $PLL_AUDIO1 = 24 \times (171+1) / (1+1) / (1+0) / (1+20) = 98.286$ MHz. According to the relationship among the F_{sin}, F_{sout}, and MCLK, the MCLK should be greater than 60 MHz. In the simulation phase, the HOSC frequency is 25 MHz, so the output frequency of PLL_AUDIO1 should be $25 \times (171+1) / (1+1) / (1+0) / (1+20) = 102.381$ MHz. In the IC test phase, configure the frequency of PLL_AUDIO1 according to its actual output frequency.
- b) It is suggested that you configure the ASRC MCLK as an equal-duty-cycle signal. You can specify an odd number for bit[21:16] (PLL_POST_DIV_P) of [PLL_AUDIO1_CTRL_REG](#) to get an equal-duty-cycle output clock of PLL_AUDIO1.
- c) Configure bit[25:24] of [R_I2S/PCM0_ASRC_CLK_REG](#) as 0x11 to select the PLL_AUDIO(4X).

2. Configure the I2S Registers

- a) Configure bit[7:4] (BCLKDIV) of [I2S/PCM_CLKD](#) as 4'h9 so that the BCLK will be PLL_AUDIO divided by 32, that is, the frequency of BCLK will be $98.286 \text{ MHz} / 32 = 3.072$ MHz.
- b) Configure bit[17:8] (LRCK_PERIOD) of [I2S/PCM_FMT0](#) as 10'h1F. That is, the LRCK_PERIOD width is configured as 32 BLCKs and can generate the ASRC CLKIN with a 48 kHz sampling rate.

$$\left(\frac{3.072 \text{ MHz}}{32 \times 2} = 48 \text{ kHz} \right)$$
- c) Configure bit[6:4] (Sample Resolution bits) of [I2S/PCM_FMT0](#) as 3'h7 to specify the sample resolution as 32-bit.
- d) Configure bit[2:0] (Slot Width bits) of [I2S/PCM_FMT0](#) as 3'h7 to specify the slot width as 32-bit.

3. Configure the ASRC Registers

- a) Configure bit[16] (clock gate) of [MCLKCFG](#) as 1'h1 to open the clock gating.
- b) Configure bit[3:0] (division factor) of [MCLKCFG](#) as 1'h1 to specify the division factor as 1.
- c) Configure bit[20] (clock gate) of [FSOUTCFG](#) as 1'h1 to open the clock gating.
- d) Configure bit[19:16] (clock select) of [FSOUTCFG](#) as 4'h0 to select I2S0_ASRC_CLK as the clock source.
- e) Configure bit[7:4] (the first division factor) of [FSOUTCFG](#) as 16'h13 to configure the first division factor as 128.
- f) Configure bit[3:0] (the second division factor) of [FSOUTCFG](#) as 16'h10 to configure the second division factor as 48.
- g) Configure the ASRC ratio.

To configure the ASRC ratio manually, configure bit[31] ([Manual Configuration of ASRC Ratio Enable](#)) of ASRCMANCFG as 1'h1 to enable the manual configuration of ASRC ratio. Configure bit[25:0] of ASRCMANCFG as 26'h155555 to specify the ratio value as 0x155555. The calculation formula for the ratio value: Dec2Hex (Fsout/Fsin)*2²²). In this example, Fsout/Fsin = 16 kHz/48 kHz = 1/3, then the ratio is 0x155555.

To configure the ASRC ratio automatically, configure bit[31] ([Manual Configuration of ASRC Ratio Enable](#)) of ASRCMANCFG as 1'h0 to enable the automatic configuration of ASRC ratio. Then the system will automatically calculate the ratio value based on the MCLK, Fsout, and Fsin.

8.1.5 Register List

| Module Name | Base Address |
|-------------|--------------|
| I2S/PCM0 | 0x02032000 |
| I2S/PCM1 | 0x02033000 |
| I2S/PCM2 | 0x02034000 |

| Register Name | Offset | Description |
|-------------------|--------|--|
| I2S/PCM_CTL | 0x0000 | I2S/PCM Control Register |
| I2S/PCM_FMT0 | 0x0004 | I2S/PCM Format Register 0 |
| I2S/PCM_FMT1 | 0x0008 | I2S/PCM Format Register 1 |
| I2S/PCM_ISTA | 0x000C | I2S/PCM Interrupt Status Register |
| I2S/PCM_RXFIFO | 0x0010 | I2S/PCM RXFIFO Register |
| I2S/PCM_FCTL | 0x0014 | I2S/PCM FIFO Control Register |
| I2S/PCM_FSTA | 0x0018 | I2S/PCM FIFO Status Register |
| I2S/PCM_INT | 0x001C | I2S/PCM DMA & Interrupt Control Register |
| I2S/PCM_TXFIFO | 0x0020 | I2S/PCM TXFIFO Register |
| I2S/PCM_CLKD | 0x0024 | I2S/PCM Clock Divide Register |
| I2S/PCM_TXCNT | 0x0028 | I2S/PCM TX Sample Counter Register |
| I2S/PCM_RXCNT | 0x002C | I2S/PCM RX Sample Counter Register |
| I2S/PCM_CHCFG | 0x0030 | I2S/PCM Channel Configuration Register |
| I2S/PCM_TX0CHSEL | 0x0034 | I2S/PCM TX0 Channel Select Register |
| I2S/PCM_TX1CHSEL | 0x0038 | I2S/PCM TX1 Channel Select Register |
| I2S/PCM_TX2CHSEL | 0x003C | I2S/PCM TX2 Channel Select Register |
| I2S/PCM_TX3CHSEL | 0x0040 | I2S/PCM TX3 Channel Select Register |
| I2S/PCM_TX0CHMAP0 | 0x0044 | I2S/PCM TX0 Channel Mapping Register0 |

| Register Name | Offset | Description |
|-------------------|--------|---|
| I2S/PCM_TX0CHMAP1 | 0x0048 | I2S/PCM TX0 Channel Mapping Register1 |
| I2S/PCM_TX1CHMAP0 | 0x004C | I2S/PCM TX1 Channel Mapping Register0 |
| I2S/PCM_TX1CHMAP1 | 0x0050 | I2S/PCM TX1 Channel Mapping Register1 |
| I2S/PCM_TX2CHMAP0 | 0x0054 | I2S/PCM TX2 Channel Mapping Register0 |
| I2S/PCM_TX2CHMAP1 | 0x0058 | I2S/PCM TX2 Channel Mapping Register1 |
| I2S/PCM_TX3CHMAP0 | 0x005C | I2S/PCM TX3 Channel Mapping Register0 |
| I2S/PCM_TX3CHMAP1 | 0x0060 | I2S/PCM TX3 Channel Mapping Register1 |
| I2S/PCM_RXCHSEL | 0x0064 | I2S/PCM RX Channel Select Register |
| I2S/PCM_RXCHMAP0 | 0x0068 | I2S/PCM RX Channel Mapping Register0 |
| I2S/PCM_RXCHMAP1 | 0x006C | I2S/PCM RX Channel Mapping Register1 |
| I2S/PCM_RXCHMAP2 | 0x0070 | I2S/PCM RX Channel Mapping Register2 |
| I2S/PCM_RXCHMAP3 | 0x0074 | I2S/PCM RX Channel Mapping Register3 |
| MCLKCFG | 0x0080 | ASRC MCLK Configuration Register |
| FsoutCFG | 0x0084 | ASRC Out Sample Rate Configuration Register |
| FsinEXTCFG | 0x0088 | ASRC Input Sample Pulse Extend Configuration Register |
| ASRCCFG | 0x008C | ASRC Enable Register |
| ASRCMANCFG | 0x0090 | ASRC Manual Ratio Configuration Register |
| ASRCRATIOSTAT | 0x0094 | ASRC Status Register |
| ASRCFIFOSTAT | 0x0098 | ASRC FIFO Level Status Register |
| ASRCMBISTCFG | 0x009C | ASRC MBIST Test Configuration Register |
| ASRCMBISTSTAT | 0x00A0 | ASRC MBIST Test Status Register |

8.1.6 Register Description

8.1.6.1 0x0000 I2S/PCM Control Register (Default Value: 0x0006_0000)

| Offset: 0x0000 | | | Register Name: I2S/PCM_CTL |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:22 | / | / | / |
| 21 | R/W | 0x0 | RX_SYNC_EN_START The bit takes effect only when RX_SYNC_EN is set to 1. I2S0/I2S1/I2S2/OWA RX Synchronize Enable Start. 0: Disabled 1: Enabled |

| Offset: 0x0000 | | | Register Name: I2S/PCM_CTL |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 20 | R/W | 0x0 | RX_SYNC_EN I2S RX Synchronize Enable 0: Disabled 1: Enabled |
| 19 | / | / | / |
| 18 | R/W | 0x1 | BCLK_OUT Bit Clock Direction Select 0: Input 1: Output |
| 17 | R/W | 0x1 | LRCK_OUT LRCK Direction Select 0: Input 1: Output |
| 16:12 | / | / | / |
| 11 | R/W | 0x0 | DOUT3_EN Data3 Output Enable 0: Disabled, Hi-Z State 1: Enabled |
| 10 | R/W | 0x0 | DOUT2_EN Data2 Output Enable 0: Disabled, Hi-Z State 1: Enabled |
| 9 | R/W | 0x0 | DOUT1_EN Data1 Output Enable 0: Disabled, Hi-Z State 1: Enabled |
| 8 | R/W | 0x0 | DOUT0_EN Data0 Output Enable 0: Disabled, Hi-Z State 1: Enabled |
| 7 | / | / | / |
| 6 | R/W | 0x0 | OUT_MUTE Data Output Mute Enable 0: Normal Transfer 1: Force DOUT to output 0 |

| Offset: 0x0000 | | | Register Name: I2S/PCM_CTL |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 5:4 | R/W | 0x0 | MODE_SEL Mode Selection 00: PCM Mode (offset 0: Long Frame; offset 1: Short Frame) 01: Left Mode (offset 0: LJ Mode; offset 1: I2S Mode) 10: Right-Justified Mode 11: Reserved |
| 3 | R/W | 0x0 | LOOP Loopback Test 0: Normal Mode 1: Loopback Test When set to '1', the bit indicates that the DOUT is connected to the DIN. |
| 2 | R/W | 0x0 | TXEN Transmitter Block Enable 0: Disabled 1: Enabled |
| 1 | R/W | 0x0 | RXEN Receiver Block Enable 0: Disabled 1: Enabled |
| 0 | R/W | 0x0 | GEN Globe Enable 0: Disabled 1: Enabled |

8.1.6.2 0x0004 I2S/PCM Format Register 0 (Default Value: 0x0000_0033)

| Offset: 0x0004 | | | Register Name: I2S/PCM_FMT0 |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31 | / | / | / |
| 30 | R/W | 0x0 | LRCK_WIDTH LRCK Width (only applies to the PCM mode) 0: LRCK = 1 BCLK Width (Short Frame) 1: LRCK = 2 BCLK Width (Long Frame) |
| 29:20 | / | / | / |

| Offset: 0x0004 | | | Register Name: I2S/PCM_FMT0 |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 19 | R/W | 0x0 | <p>LRCK_POLARITY</p> <p>In I2S/Left-Justified/Right-Justified mode:</p> <p>0: Left Channel when LRCK is low.</p> <p>1: Left channel when LRCK is high.</p> <p>In PCM mode:</p> <p>0: PCM LRCK asserted at the negative edge.</p> <p>1: PCM LRCK asserted at the positive edge.</p> |
| 18 | / | / | / |
| 17:8 | R/W | 0x0 | <p>LRCK_PERIOD</p> <p>It is used to program the number of BCLKs per channel of the sample frame. This value is interpreted as follows.</p> <p>PCM mode: Number of BCLKs within (Left + Right) channel width.</p> <p>I2S/Left-Justified/Right-Justified mode: Number of BCLKs within each channel width (Left or Right).</p> <p>For example:</p> <p>N = 7: 8 BCLKs width</p> <p>...</p> <p>N = 1023: 1024 BCLKs width</p> |
| 7 | R/W | 0x0 | <p>BCLK_POLARITY</p> <p>0: Normal mode, DOUT drives data at negative edge</p> <p>1: Invert mode, DOUT drives data at positive edge</p> |
| 6:4 | R/W | 0x3 | <p>SR</p> <p>Sample Resolution</p> <p>000: Reserved</p> <p>001: 8-bit</p> <p>010: 12-bit</p> <p>011: 16-bit</p> <p>100: 20-bit</p> <p>101: 24-bit</p> <p>110: 28-bit</p> <p>111: 32-bit</p> |

| Offset: 0x0004 | | | Register Name: I2S/PCM_FMT0 |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 3 | R/W | 0x0 | <p>EDGE_TRANSFER</p> <p>Edge Transfer</p> <p>0: DOUT drives data and DIN sample data at the different BCLK edge</p> <p>1: DOUT drives data and DIN sample data at the same BCLK edge</p> <p>BCLK_POLARITY = 0, EDGE_TRANSFER = 0, DIN sample data at positive edge;</p> <p>BCLK_POLARITY = 0, EDGE_TRANSFER = 1, DIN sample data at negative edge;</p> <p>BCLK_POLARITY = 1, EDGE_TRANSFER = 0, DIN sample data at negative edge;</p> <p>BCLK_POLARITY = 1, EDGE_TRANSFER = 1, DIN sample data at positive edge.</p> |
| 2:0 | R/W | 0x3 | <p>SW</p> <p>Slot Width Select</p> <p>000: Reserved</p> <p>001: 8-bit</p> <p>010: 12-bit</p> <p>011: 16-bit</p> <p>100: 20-bit</p> <p>101: 24-bit</p> <p>110: 28-bit</p> <p>111: 32-bit</p> |

8.1.6.3 0x0008 I2S/PCM Format Register 1 (Default Value: 0x0000_0030)

| Offset: 0x0008 | | | Register Name: I2S/PCM_FMT1 |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:8 | / | / | / |
| 7 | R/W | 0x0 | <p>RX MLS</p> <p>MSB/LSB First Select</p> <p>0: MSB First</p> <p>1: LSB First</p> |

| Offset: 0x0008 | | | Register Name: I2S/PCM_FMT1 |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 6 | R/W | 0x0 | TX_MLS MSB/LSB First Select 0: MSB First 1: LSB First |
| 5:4 | R/W | 0x3 | SEXT Sign Extend in Slot [Sample Resolution < Slot Width] 00: Zeros or audio gain padding at LSB position 01: Sign extension at MSB position 10: Reserved 11: Transfer 0 after each sample in each Slot |
| 3:2 | R/W | 0x0 | RX_PDM PCM Data Mode 00: Linear PCM 01: Reserved 10: 8-bit u-law 11: 8-bit A-law |
| 1:0 | R/W | 0x0 | TX_PDM PCM Data Mode 00: Linear PCM 01: Reserved 10: 8-bit u-law 11: 8-bit A-law |

8.1.6.4 0x000C I2S/PCM Interrupt Status Register (Default Value: 0x0000_0010)

| Offset: 0x000C | | | Register Name: I2S/PCM_ISTA |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:7 | / | / | / |
| 6 | R/W1C | 0x0 | TXU_INT TXFIFO Underrun Pending Interrupt 0: No pending interrupt 1: TXFIFO underrun pending interrupt Write '1' to clear this interrupt. |

| Offset: 0x000C | | | Register Name: I2S/PCM_ISTA |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 5 | R/W1C | 0x0 | TXO_INT TXFIFO Overrun Pending Interrupt 0: No pending interrupt 1: TXFIFO overrun pending interrupt Write '1' to clear this interrupt. |
| 4 | R | 0x1 | TXE_INT TXFIFO Empty Pending Interrupt 0: No pending IRQ 1: TXFIFO empty pending interrupt when data in TXFIFO are less than TX trigger level |
| 3 | / | / | / |
| 2 | R/W1C | 0x0 | R XU_INT RXFIFO Underrun Pending Interrupt 0: No pending interrupt 1: RXFIFO underrun pending interrupt Write '1' to clear this interrupt. |
| 1 | R/W1C | 0x0 | R XO_INT RXFIFO Overrun Pending Interrupt 0: No pending IRQ 1: RXFIFO overrun pending IRQ Write '1' to clear this interrupt. |
| 0 | R/W | 0x0 | R XA_INT RXFIFO Data Available Pending Interrupt 0: No pending IRQ 1: Data available pending IRQ when data in RXFIFO are more than RX trigger level |

8.1.6.5 0x0010 I2S/PCM RXFIFO Register (Default Value: 0x0000_0000)

| Offset: 0x0010 | | | Register Name: I2S/PCM_RXFIFO |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | RX_DATA RX Sample The host can get one sample by reading this register. The left channel sample data is first and then the right channel sample. |

8.1.6.6 0x0014 I2S/PCM FIFO Control Register (Default Value: 0x0004_00F0)

| Offset: 0x0014 | | | Register Name: I2S/PCM_FCTL |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R/W | 0x0 | HUB_EN Audio Hub Enable The bit takes effect only when TXEN is set to 1. I2S0/I2S1/I2S2/OWA TXFIFO Hub Enable. 0: Disabled 1: Enabled |
| 30:26 | / | / | / |
| 25 | R/WAC | 0x0 | FTX Write '1' to flush TXFIFO, self clear to '0'. |
| 24 | R/WAC | 0x0 | FRX Write '1' to flush RXFIFO, self clear to '0'. |
| 23:19 | / | / | / |
| 18:12 | R/W | 0x40 | TXTL TXFIFO Empty Trigger Level Interrupt and DMA request trigger level for TXFIFO normal condition. Trigger Level = TXTL |
| 11:10 | / | / | / |
| 9:4 | R/W | 0xF | RXTL RXFIFO Trigger Level Interrupt and DMA request trigger level for RXFIFO normal condition. Trigger Level = RXTL + 1 |
| 3 | / | / | / |
| 2 | R/W | 0x0 | TXIM TXFIFO Input Mode (Mode 0, 1) 0: Valid data at the MSB of TXFIFO register 1: Valid data at the LSB of TXFIFO register Example for 20-bit transmitted audio sample: Mode 0: TXFIFO[31:0] = {APB_WDATA[31:12], 12'h0} Mode 1: TXFIFO[31:0] = {APB_WDATA[19:0], 12'h0} |

| Offset: 0x0014 | | | Register Name: I2S/PCM_FCTL |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 1:0 | R/W | 0x0 | <p>RXOM</p> <p>RXFIFO Output Mode (Mode 0, 1, 2, 3)</p> <p>00: Expanding '0' at LSB of RXFIFO register</p> <p>01: Expanding received sample sign bit at MSB of RXFIFO register</p> <p>10: Truncating received samples at high half-word of RXFIFO register and low half-word of RXFIFO register is filled by '0'</p> <p>11: Truncating received samples at low half-word of RXFIFO register and high half-word of RXFIFO register is expanded by its sign bit</p> <p>Example for 20-bit received audio sample:</p> <p>Mode 0: APB_RDATA[31:0] = {RXFIFO[31:12], 12'h0}</p> <p>Mode 1: APB_RDATA[31:0] = {12{RXFIFO[31]}, RXFIFO[31:12]}</p> <p>Mode 2: APB_RDATA [31:0] = {RXFIFO[31:16], 16'h0}</p> <p>Mode 3: APB_RDATA[31:0] = {16{RXFIFO[31]}, RXFIFO[31:16]}</p> |

8.1.6.7 0x0018 I2S/PCM FIFO Status Register (Default Value: 0x1080_0080)

| Offset: 0x0018 | | | Register Name: I2S/PCM_FSTA |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:29 | / | / | / |
| 28 | R | 0x1 | <p>TXE</p> <p>TXFIFO Empty</p> <p>0: No room for new sample in TXFIFO</p> <p>1: More than one room for new sample in TXFIFO (>= 1 Word)</p> |

8.1.6.11 0x0028 I2S/PCM TX Sample Counter Register (Default Value: 0x0000_0000)

| Offset: 0x0028 | | | Register Name: I2S/PCM_TXCNT |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | <p>TX_CNT TX Sample Counter</p> <p>The audio sample number of sending into TXFIFO. When one sample is put into TXFIFO by DMA or by host IO, the TX sample counter register increases by one. The TX sample counter register can be set to any initial value at any time. After being updated by the initial value, the counter register should count on the base of this initial value.</p> |

8.1.6.12 0x002C I2S/PCM RX Sample Counter Register (Default Value: 0x0000_0000)

| Offset: 0x002C | | | Register Name: I2S/PCM_RXCNT |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | <p>RX_CNT RX Sample Counter</p> <p>The audio sample number of writing into RXFIFO. When one sample is written by Digital Audio Engine, the RX sample counter register increases by one. The RX sample counter register can be set to any initial value at any time. After being updated by the initial value, the counter register should count on the base of this initial value.</p> |

8.1.6.13 0x0030 I2S/PCM Channel Configuration Register (Default Value: 0x0000_0000)

| Offset: 0x0030 | | | Register Name: I2S/PCM_CHCFG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:10 | / | / | / |
| 9 | R/W | 0x0 | <p>TX_SLOT_HIZ</p> <p>0: Normal mode for the last half-cycle of BCLK in the slot 1: Turn to Hi-Z state for the last half-cycle of BCLK in the slot</p> |
| 8 | R/W | 0x0 | <p>TX_STATE</p> <p>0: Transfer level 0 in non-transferring slot 1: Turn to Hi-Z State (TDM) in non-transferring slot</p> |

| Offset: 0x0030 | | | Register Name: I2S/PCM_CHCFG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 7:4 | R/W | 0x0 | RX_SLOT_NUM RX Channel/Slot number between CPU/DMA and RXFIFO 0000: 1 channel or slot ... 0111: 8 channels or slots 1000: 9 channels or slots ... 1111: 16 channels or slots |
| 3:0 | R/W | 0x0 | TX_SLOT_NUM TX Channel/Slot number between CPU/DMA and TXFIFO 0000: 1 channel or slot ... 0111: 8 channels or slots 1000: 9 channels or slots ... 1111: 16 channels or slots |

8.1.6.14 0x0034 I2S/PCM TX0 Channel Select Register (Default Value: 0x0000_0000)

| Offset: 0x0034 | | | Register Name: I2S/PCM_TX0CHSEL |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:22 | / | / | / |
| 21:20 | R/W | 0x0 | TX0_OFFSET TX0 Offset Tune (TX0 Data offset to LRCK) 0: No offset n: Data is offset by n BCLKs to LRCK |
| 19:16 | R/W | 0x0 | TX0_CHSEL TX0 Channel (Slot) Number Select for Each Output 0000: 1 channel or slot ... 0111: 8 channels or slots 1000: 9 channels or slots ... 1111: 16 channels or slots |

| Offset: 0x0034 | | | Register Name: I2S/PCM_TX0CHSEL |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 15:0 | R/W | 0x0 | <p>TX0_CHEN</p> <p>TX0 Channel (Slot) Enable</p> <p>The bit[15:0] refer to Slot [15:0]. When one or more slots are disabled, the affected slots are set to the disable state.</p> <p>0: Disabled</p> <p>1: Enabled</p> |

8.1.6.15 0x0038 I2S/PCM TX1 Channel Select Register (Default Value: 0x0000_0000)

| Offset: 0x0038 | | | Register Name: I2S/PCM_TX1CHSEL |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:22 | / | / | / |
| 21:20 | R/W | 0x0 | <p>TX1_OFFSET</p> <p>TX1 Offset Tune (TX1 Data offset to LRCK)</p> <p>0: No offset</p> <p>n: Data is offset by n BCLKs to LRCK</p> |
| 19:16 | R/W | 0x0 | <p>TX1_CHSEL</p> <p>TX1 Channel (Slot) Number Select for Each Output</p> <p>0000: 1 channel or slot</p> <p>...</p> <p>0111: 8 channels or slots</p> <p>1000: 9 channels or slots</p> <p>...</p> <p>1111: 16 channels or slots</p> |
| 15:0 | R/W | 0x0 | <p>TX1_CHEN</p> <p>TX1 Channel (Slot) Enable</p> <p>The bit[15:0] refers to Slot [15:0]. When one or more slots are disabled, the affected slots are set to the disable state.</p> <p>0: Disabled</p> <p>1: Enabled</p> |

8.1.6.16 0x003C I2S/PCM TX2 Channel Select Register (Default Value: 0x0000_0000)

| Offset: 0x003C | | | Register Name: I2S/PCM_TX2CHSEL |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:22 | / | / | / |
| 21:20 | R/W | 0x0 | TX2_OFFSET TX2 Offset Tune (TX2 Data offset to LRCK) 0: No offset n: Data is offset by n BCLKs to LRCK |
| 19:16 | R/W | 0x0 | TX2_CHSEL TX2 Channel (Slot) Number Select for Each Output 0000: 1 channel or slot ... 0111: 8 channels or slots 1000: 9 channels or slots ... 1111: 16 channels or slots |
| 15:0 | R/W | 0x0 | TX2_CHEN TX2 Channel (Slot) Enable The bit[15:0] refers to Slot [15:0]. When one or more slots are disabled, the affected slots are set to the disable state. 0: Disabled 1: Enabled |

8.1.6.17 0x0040 I2S/PCM TX3 Channel Select Register (Default Value: 0x0000_0000)

| Offset: 0x0040 | | | Register Name: I2S/PCM_TX3CHSEL |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:22 | / | / | / |
| 21:20 | R/W | 0x0 | TX3_OFFSET TX3 Offset Tune (TX3 Data offset to LRCK) 0: No offset n: Data is offset by n BCLKs to LRCK |

| Offset: 0x0040 | | | Register Name: I2S/PCM_TX3CHSEL |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 19:16 | R/W | 0x0 | TX3_CHSEL TX3 Channel (Slot) Number Select for Each Output 0000: 1 channel or slot ... 0111: 8 channels or slots 1000: 9 channels or slots ... 1111: 16 channels or slots |
| 15:0 | R/W | 0x0 | TX3_CHEN TX3 Channel (Slot) Enable The bit[15:0] refers to Slot [15:0]. When one or more slots are disabled, the affected slots are set to the disable state. 0: Disabled 1: Enabled |

8.1.6.18 0x0044 I2S/PCM TX0 Channel Mapping0 Register 0 (Default Value: 0x0000_0000)

8.2 DMIC

8.2.1 Overview

The DMIC controller supports one 8-channel digital microphone interface and can output 128 fs or 64 fs (fs = ADC sample rate).

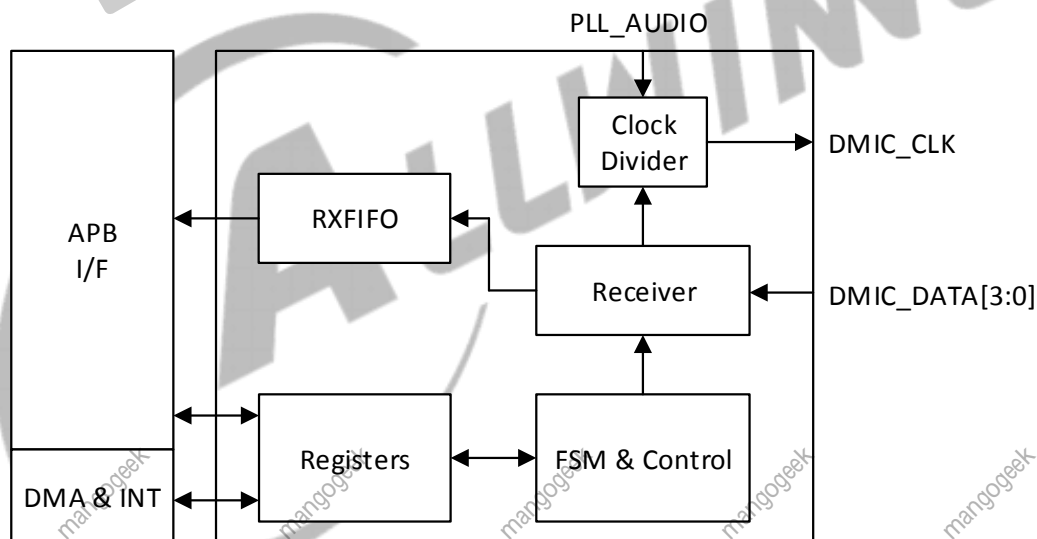

The DMIC controller includes the following features:

- Supports up to 8 channels
- Sample rate from 8 kHz to 48 kHz

8.2.2 Block Diagram

The following figure shows a block diagram of the DMIC.

Figure 8-12 DMIC Block Diagram

8.2.3 Functional Description

8.2.3.1 External Signals

The following table describes the external signals of DMIC.

Table 8-5 DMIC External Signals

| Signal | Description | Type |
|------------|---------------------------------|------|
| DMIC-CLK | Digital Microphone Clock Output | O |
| DMIC-DATA0 | Digital Microphone Data Input | I |
| DMIC-DATA1 | Digital Microphone Data Input | I |
| DMIC-DATA2 | Digital Microphone Data Input | I |
| DMIC-DATA3 | Digital Microphone Data Input | I |

8.2.3.2 Clock Sources

The following table describes the clock source for DMIC. For clock setting, configurations, and gating information, refer to section 3.2 “[CCU](#)”.

Table 8-6 DMIC Clock Sources

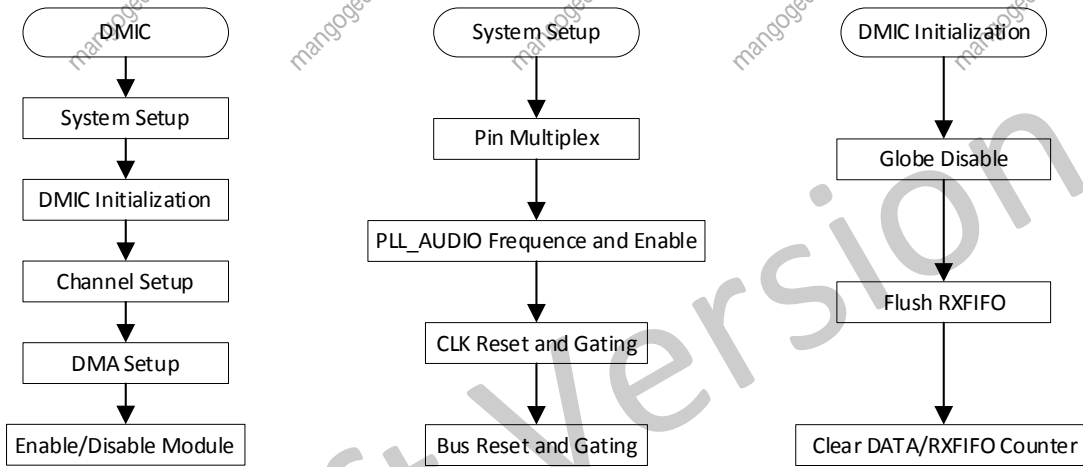

| Clock Sources | Description |
|------------------|--|
| PLL_AUDIO0(1X) | By default, PLL_AUDIO0(1X) is 24.5714 MHz. |
| PLL_AUDIO1(DIV2) | By default, PLL_AUDIO1 is 3072 MHz, PLL_AUDIO1(DIV2) is 1536 MHz, and PLL_AUDIO1(DIV5) is 614.4 MHz (24.576 MHz*25). |
| PLL_AUDIO1(DIV5) | |

8.2.3.3 Operation Mode

The software operation of the DMIC is divided into five steps: system setup, DMIC initialization, channel setup, DMA setup, and Enable/Disable module.

The following figure shows the flow chart of the whole operation, the system setup, and the DMIC initialization.

Figure 8-13 DMIC Operation Mode

1. System Setup and DMIC Initialization

The first step in the system setup is properly programming the GPIO because the DMIC port is a multiplex pin. For functions of the multiplex pins, refer to the pin multiplex specification.

Perform the following steps for the clock source. Firstly, disable the PLL_AUDIO through [PLL_AUDIOx Control Register](#)[PLL_ENABLE]. Secondly, set up the frequency of the PLL_AUDIO in [PLL_AUDIOx Control Register](#). Then enable PLL_AUDIO. After that, enable the DMIC gating through [DMIC_CLK_REG](#) when you checkout that the LOCK bit of [PLL_AUDIOx Control Register](#) becomes 1. At last, reset and enable the DMIC bus gating by [DMIC_BGR_REG](#).

After the system setup, the register of DMIC can be setup. Firstly, initialize the DMIC. You should close the globe enable bit ([DMIC_EN](#)[8]), data channel enable bit ([DMIC_EN](#)[7:0]) by writing 0 to it. After that, flush the RXFIFO by writing 1 to [DMIC_RXFIFO_CTR](#)[31]. At last, you can clear the Data/RXFIFO counter by writing 1 to [DMIC_RXFIFO_STA](#), [DMIC_CNT](#).

2. Channel Setup and DMA Setup

You can set up the sample rate, the sample resolution, the over-sample rate, the channel number, the RXFIFO output mode, the RXFIFO trigger level, and so on. The setup of the register can be found in the specification.

The DMIC supports two methods to transfer the data. The most common way is DMA, the setup of DMA can be found in section 3.9 “[DMAC](#)”. In this module, you just enable the DRQ.

3. Enable and Disable DMIC

To enable the function, you can enable the data channel enable bit ([DMIC_EN](#)[7:0]) by writing 1 to it. After that, enable DMIC by writing 1 to the Globe Enable bit ([DMIC_EN](#)[8]). Write 0 to [DMIC_EN](#)[8] to disable DMIC.

8.2.4 Register List

| Module Name | Base Address |
|-------------|--------------|
| DMIC | 0x02031000 |

| Register Name | Offset | Description |
|---------------------|--------|--|
| DMIC_EN | 0x0000 | DMIC Enable Control Register |
| DMIC_SR | 0x0004 | DMIC Sample Rate Register |
| DMIC_CTR | 0x0008 | DMIC Control Register |
| DMIC_DATA | 0x0010 | DMIC Data Register |
| DMIC_INTC | 0x0014 | DMIC Interrupt Control Register |
| DMIC_INTS | 0x0018 | DMIC Interrupt Status Register |
| DMIC_RXFIFO_CTR | 0x001C | DMIC RXFIFO Control Register |
| DMIC_RXFIFO_STA | 0x0020 | DMIC RXFIFO Status Register |
| DMIC_CH_NUM | 0x0024 | DMIC Channel Numbers Register |
| DMIC_CH_MAP | 0x0028 | DMIC Channel Mapping Register |
| DMIC_CNT | 0x002C | DMIC Counter Register |
| DATA0_DATA1_VOL_CTR | 0x0030 | Data0 and Data1 Volume Control Register |
| DATA2_DATA3_VOL_CTR | 0x0034 | Data2 And Data3 Volume Control Register |
| HPF_EN_CTR | 0x0038 | High Pass Filter Enable Control Register |
| HPF_COEF_REG | 0x003C | High Pass Filter Coefficient Register |
| HPF_GAIN_REG | 0x0040 | High Pass Filter Gain Register |

8.2.5 Register Description

8.2.5.1 0x0000 DMIC Enable Control Register (Default Value: 0x0000_0000)

| Offset: 0x0000 | | | Register Name: DMIC_EN |
|----------------|------------|-------------|------------------------|

8.2.5.16 0x0040 High Pass Filter Gain Register (Default Value: 0x00FF_D522)

| Offset: 0x0040 | | | Register Name: HPF_GAIN_REG |
|----------------|------------|-------------|-----------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x00FFD522 | HPF_GAIN High Pass Filter Gain |

8.3 OWA

8.3.1 Overview

The One Wire Audio (OWA) provides a serial bus interface for audio data. This interface is widely used for consumer audio.

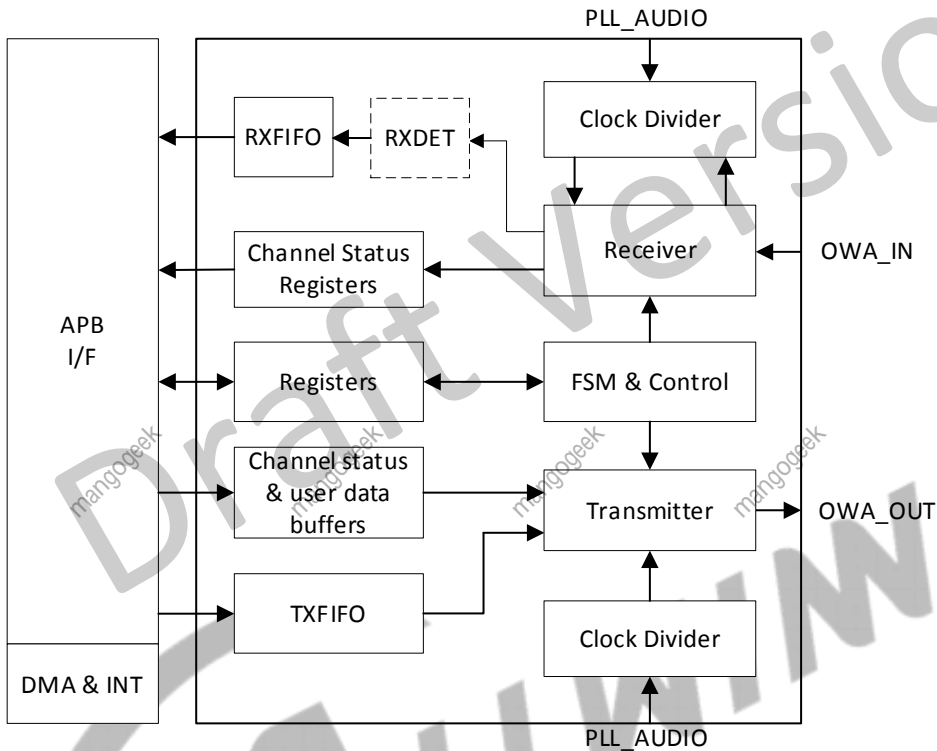

The OWA includes the following features:

- Compliance with S/PDIF Interface
- Compatible with standard IEC-60958 and IEC-61937
 - IEC-60958 supports 16-bit, 20-bit and 24-bit data formats
 - IEC-61937 uses the IEC-60958 series for the conveying of non-linear PCM bit streams, each sub-frame transmits 16-bit
- TXFIFO and RXFIFO
 - One 128×24bits TXFIFO and one 64×24bits RXFIFO for audio data transfer
 - Programmable FIFO thresholds
- Supports TX/RX DMA slave interface
- Supports multiple function clock
 - Separate clock for OWA TX and OWA RX
 - The clock of TX function includes a series of 24.576 MHz and 22.579 MHz frequency
 - The clock of RX function includes a series of 24.576*8 MHz frequency (RX function clock 24.576*8 MHz supports CDR of sample rate from 8 kHz to 192 kHz)
- Supports hardware parity on TX/RX
 - Hardware parity generation on the transmitter
 - Hardware parity checking on the receiver
- Supports channel status capture for the receiver
- Supports channel sample rate capture on the receiver
- Supports insertion detection for the receiver
- Supports channel status insertion for the transmitter
- Supports interrupts and DMA

8.3.2 Block Diagram

The following figure shows the OWA block diagram.

Figure 8-14 OWA Block Diagram

OWA contains the following sub-blocks:

Table 8-7 OWA Sub-blocks

| Sub-block | Description |
|---------------|---|
| Registers | Analyze the configuration parameter, DMA requests, and IRQ feedbacks. |
| Receiver | Parses the frame header and receives the data. |
| Transmitter | Sends the data |
| FSM | Finite state machine |
| Clock Divider | Clock divider circuit |

8.3.3 Functional Description

8.3.3.1 External Signals

The OWA is a Biphase-Mark Encoding Digital Audio Transfer protocol. In this protocol, the CLK signal and data signal are transferred in the same line. The following figure describes the external signals of OWA. OWA-OUT is the output pin for the output CLK and DATA, and OWA-IN is the input pin for the input CLK and DATA.

Table 8-8 OWA External Signals

| Signal Name | Description | Type |
|-------------|-------------|------|
| OWA-OUT | OWA output | O |
| OWA-IN | OWA input | I |

8.3.3.2 Clock Sources

The OWA has separate clock for OWA_TX and OWA_RX. The following tables describe the clock sources for OWA_TX and OWA_RX. For clock setting, configurations and gating information, refer to section 3.2 “[CCU](#)”.

Table 8-9 OWA_TX Clock Sources

| Clock Name | Description |
|------------------|--|
| PLL_AUDIO0(1X) | By default, PLL_AUDIO0(1X) is 24.5714 MHz, and PLL_AUDIO0(4X) is 98.2856 MHz. |
| PLL_AUDIO0(4X) | |
| PLL_AUDIO1(DIV2) | By default, PLL_AUDIO1 is 3072 MHz, PLL_AUDIO1(DIV2) is 1536 MHz, and PLL_AUDIO1(DIV5) is 614.4 MHz (24.576 MHz*25). |
| PLL_AUDIO1(DIV5) | |

Table 8-10 OWA_RX Clock Sources

| Clock Name | Description |
|------------------|--|
| PLL_PERI(1X) | The default frequency of PLL_PERI(1X) is 600 MHz. |
| PLL_AUDIO1(DIV2) | By default, PLL_AUDIO1 is 3072 MHz, PLL_AUDIO1(DIV2) is 1536 MHz, and PLL_AUDIO1(DIV5) is 614.4 MHz (24.576 MHz*25). |
| PLL_AUDIO1(DIV5) | |

8.3.3.3 Biphase-Mark Code (BMC)

In the OWA format, the digital signal is coded using the biphase-mark code (BMC). The clock, frame, and data are embedded in only one signal—the data pin. In the BMC system, each data bit is encoded into two logical states (00, 01, 10, or 11) at the pin. The following figure and table show how data is encoded to the BMC format.

The frequency of the clock is twice the data bit rate, as shown in the following figure. Also, the clock is always programmed to $128 \times f_s$, where f_s is the sample rate. The device receiving in the OWA format can recover the clock and frame information from the BMC signal.

Figure 8-15 OWA Biphase-Mark Code

Table 8-11 Biphase-Mark Encoder

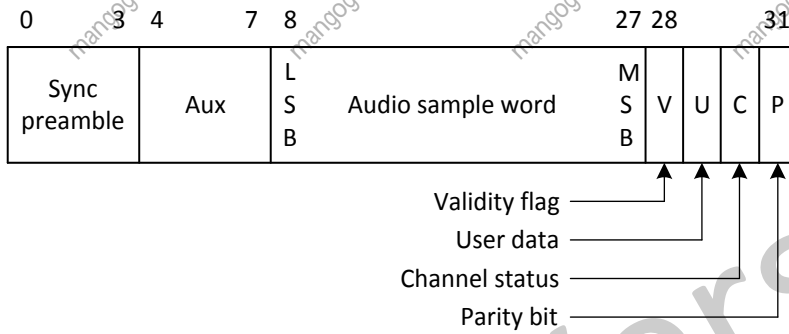

| Data | Previous State | BMC |
|------|----------------|-----|
| 0 | 0 | 11 |
| 0 | 1 | 00 |
| 1 | 0 | 10 |
| 1 | 1 | 01 |

8.3.3.4 IEC60958 Transmit Format

The OWA supports digital audio data transfer and receive. It also supports full-duplex synchronous work mode. The software can set the work mode by the OWA Control Register.

Every audio sample transmitted in a sub-frame consists of 32-bit, numbered from 0 to 31. The following figure shows a sub-frame.

Figure 8-16 OWA Sub-Frame Format

Bits 0-3 carry one of the four permitted preambles to signify the type of audio sample in the current sub-frame. The preamble is not encoded in BMC format, and therefore the preamble code can contain more than two consecutive 0 or 1 logical states in a row.

Bits 4-27 carry the audio sample word in linear 2s-complement representation. The most-significant bit (MSB) is carried by bit 27. When a 24-bit coding range is used, the least-significant bit (LSB) is in bit 4. When a 20-bit coding range is used, bit[8:27] carry the audio sample word with the LSB in bit 8. Bit[4:7] may be used for other applications and are designated auxiliary sample bits.

If the source provides fewer bits than the interface allows (either 20 or 24), the unused LSBs are set to logical 0. For a nonlinear PCM audio application or a data application, the main data field may carry any other information.

Bit 28 carries the validity bit (V) associated with the main data field in the sub-frame.

Bit 29 carries the user data channel (U) associated with the main data field in the sub-frame.

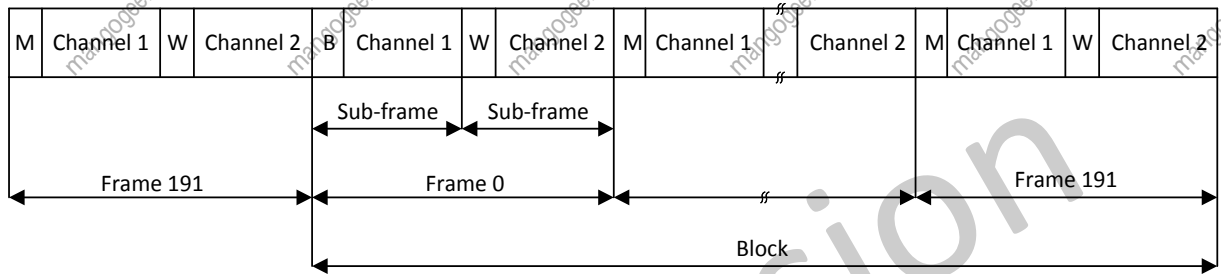

Bit 30 carries the channel status information (C) associated with the main data field in the sub-frame. The channel status indicates if the data in the sub-frame is a digital audio or some other type of data.

Bit 31 carries a parity bit (P) such that bit 4-31 carry an even number of 1s and an even number of 0s (even parity). As shown in the following table, the preambles (bit 0-3) are also defined with even parity.

Table 8-12 Preamble Codes

| Preamble Code | Previous Logical State | Logical State | Description |
|---------------|------------------------|---------------|----------------------------------|
| B (or Z) | 0 | 1110 1000 | Start of a block and sub-frame 1 |
| M (or X) | 0 | 1110 0010 | Sub-frame 1 |
| W (or Y) | 0 | 1110 0100 | Sub-frame 2 |

Figure 8-17 OWA Frame/Block Format

8.3.3.5 IEC61937 Transmit Format

IEC 61937 applies to the digital audio interface by using the IEC 60958 series for the conveying of non-linear PCM encoded audio bitstreams. The non-linear PCM encoded audio bitstream is transferred by using the basic 16-bit data area of the IEC 60958 subframes, i.e. in time-slots 12 to 27. Because the non-linear PCM encoded audio bitstream to be transported is at a lower data rate than that supported by the IEC 60958 interface, the audio bitstream is broken into a sequence of discrete data-bursts, and stuffing between the data-bursts is necessary.

IEC 60958 Data Burst

The method of placing the data into the IEC 60958 bitstream is to format the data to be transmitted into data-bursts and to send each data-burst in a continuous sequence of IEC 60958 frames.

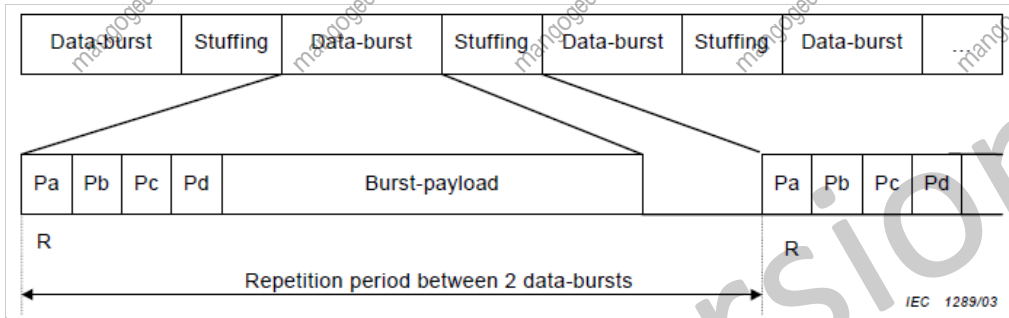

Table 8-13 Bit Allocation of Data-Burst in IEC 60958 Subframes

| Subframe | Bit of subframes | | | | |
|------------------------------------|------------------|------|---------------|------|------------|
| | MSB b27 | b26 | b25 b14 | b13 | LSB b12 |
| Frame 0; subframe B or M | 0 | 1 | | 14 | 15 |
| Frame 0; subframe W | 16 | 17 | | 30 | 31 |
| Frame 1; subframe B or M | 32 | 33 | | 46 | 47 |
| Frame 1; subframe W | 48 | 49 | | 62 | 63 |
| Frame 2; subframe B or M | 64 | 65 | | 78 | 79 |
| ----- | | | ----- | | |
| Last subframe B or M of data-burst | n-32 | n-31 | | n-18 | n-17 |
| Last subframe W of data-burst | n-16 | n-15 | | n-2 | n-1 |

Data Burst Format

Each data-burst contains a burst-preamble consisting of four 16-bit words (Pa, Pb, Pc and Pd) followed by the burst-payload which contains data of an encoded audio frame.

Figure 8-18 Data-Burst Format

(1) Burst-preamble

The burst-preamble consists of four mandatory fields. Pa and Pb represent a synchronization word. Pc gives information about the type of data, and some information/control for the receiver. Pd gives the length of the burst-payload, and is limited to 65535 bits in the case of Pd represent bits length, or is limited to 65535 bytes in the case of Pd represent bytes length.

Figure 8-19 Data-burst Preamble

The four preamble words are contained in two sequential IEC 60958 frames. The frame beginning the data-burst contains preamble word Pa in subframe 1, and Pb in subframe 2. The next frame contains Pc in subframe 1 and Pd in subframe 2. When placed into an IEC 60958 subframe, the MSB of a 16-bit burst-preamble word is placed into time-slot 27 and the LSB is placed into time-slot 12.

Figure 8-20 Data-burst Preamble words

| Preamble word | Length of field | Contents | Value MSB..LSB |
|---------------|-----------------|-------------|--|
| Pa | 16-bit | Sync word 1 | F872h |
| Pb | 16-bit | Sync word 2 | 4E1Fh |
| Pc | 16-bit | Burst-info | Table 5 |
| Pd | 16-bit | Length-code | Number of bits or number of bytes according to data-type |

(2) Burst-information

The 16-bit burst-information contains information about the data which will be found in the data-burst.

Figure 8-21 Fields of Burst-information

| Bits of Pc | Value | Contents | Remark |
|------------|-------|---|-----------------|
| 0 - 6 | | Data-type | See IEC 61937-2 |
| 7 | 0 | Error-flag indicating a valid burst-payload | |
| | 1 | Error-flag indicating that the burst-payload may contain errors | |
| 8 - 12 | | Data-type-dependent info | |
| 13 - 15 | 0 | Bitstream-number | |

NOTE The repetition period of pause data-bursts depends on the application in which IEC 60958 is used to convey encoded audio bitstreams.

The 7-bit data-type is defined in bits 0-6 of the burst-preamble Pc, the bit 6 is the MSB. This data-type field indicates the format of the burst-payload, which will be conveyed in the data-burst. Typical properties of a data-type are the reference point and repetition period of the burst, which is the number of sampling periods of the audio between the reference point of the current data-burst and the reference point of the next data-burst. The reference point is inherently defined for each data-type.

The error-flag bit is available to indicate if the contents of the data-burst contain data errors. If a data-burst is thought to be error-free, or if the data source does not know if the data contains errors, then the value of this bit is set to a '0'. If the data source does know that a particular data-burst contains some errors this bit may be set to a '1'. The usage of this bit by receiver is optional.

The meaning of the 5-bit data-type-dependent info depends on the value of the data-type.

The 3-bit bitstream-number indicates to which bitstream the data-burst belongs. Eight codes (0-7) are available so that up to eight independent bitstreams may be multiplexed in one bitstream in a time multiplex. Each independent bitstream shall use a unique bit-streamnumber.

(3) Length-code

The length-code indicates the number of bits or bytes according to data-type within the databurst, from 0 to 65535. The size of the Pa, Pb, Pc and Pd is not counted in the value of the length-code. In other words, the length-code indicates the number of bits of the burst-payload in bits, plus the conditional length of Pe and Pf, or the number of bytes of the burst-payload in bytes, plus the conditional length of Pe and Pf if exists.

Figure 8-22 Length of the Burst-Payload Specified by Pd

IEC 1292/03

8.3.3.6 Audio Sample Ratio Detection

The sampling rate is calculated according to the data pulse back-stepping method. In the first phase lock of the CDR, find 1 Frame period, count by using the high-speed sampling clock, and read the counting value of the pulse, then the sampling rate can be calculated.

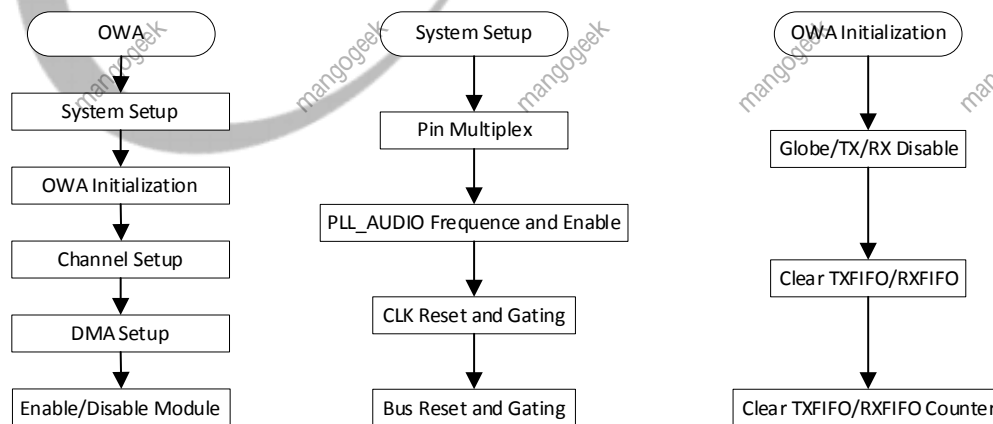

Table 8-14 The Corresponding Relation between Different System Clock and Sample Ratio

| TX Sample Rate (kHz) | Sample Clock Cycles | |
|----------------------|---------------------|----------------|
| | 196.608 MHz-SysClk | 200 MHz-SysClk |
| 22.05 | 8916(±5) | 9070(±5) |
| 24 | 8192(±5) | 8333(±5) |
| 32 | 6144(±5) | 6250(±5) |
| 44.1 | 4458(±5) | 4535(±5) |
| 48 | 4096(±5) | 4166(±5) |
| 96 | 2048(±5) | 2083(±5) |
| 176.4 | 1114(±5) | 1133(±5) |
| 192 | 1024(±5) | 1041(±5) |

8.3.3.7 Operation Modes

The software operation of the OWA is divided into five steps: system setup, OWA initialization, channel setup, DMA setup and enable/disable module. The following sections describe these five steps.

Figure 8-23 OWA Operation Flow

1. System Setup and OWA Initialization

The first step in the OWA initialization is properly programming the GPIO because the OWA port is a multiplex pin. You can find the function in section 9.7 “GPIO”.

The clock source for the OWA should be followed. Firstly, reset the audio PLL in [PLL AUDIOx Control Register](#). Secondly, set up the frequency of the Audio PLL in the [PLL AUDIOx Control Register](#). After that, enable the OWA gating. Lastly, enable the OWA bus gating.

After the system setup, the register of OWA can be set up. Firstly, reset the OWA by writing 1 to [OWA_CTL\[0\]](#) and clear the TX/RX FIFO by writing 1 to [OWA_FCTL\[17:16\]](#). After that, enable the globe enable bit by writing 1 to [OWA_CTL\[1\]](#) and clear the interrupt and TX/RX counter by setting [OWA_ISTA](#) and [OWA_TX_CNT/OWA_RX_CNT.C](#)

2. Channel Setup and DMA Setup

You can set up the audio type, clock divider ratio, the sample format, and the trigger level, and so on. The setup of the register can be found in the specification.

The OWA supports two methods to transfer the data. The most common way is DMA, the configuration of DMA can be found in section 3.9 “[DMAC](#)”. In this module, you just enable the DRQ in [OWA_INT\[7\]](#).

3. Enable and Disable OWA

To enable the function, you can enable TX/RX by writing [OWA_TX_CFG\[31\]/OWA_RX_CFG\[0\]](#). After that, enable OWA by writing 1 to [OWA_CTL\[1\]](#). Writing 0 to [OWA_CTL\[1\]](#) to disable process.

8.3.4 Register List

| Module Name | Base Address |
|-------------|--------------|
| OWA | 0x02036000 |

| Register Name | Offset | Description |
|---------------|--------|---------------------------------|
| OWA_GEN_CTL | 0x0000 | OWA General Control Register |
| OWA_TX_CFG | 0x0004 | OWA TX Configuration Register |
| OWA_RX_CFG | 0x0008 | OWA RX Configuration Register |
| OWA_ISTA | 0x000C | OWA Interrupt Status Register |
| OWA_RXFIFO | 0x0010 | OWA RXFIFO Register |
| OWA_FCTL | 0x0014 | OWA FIFO Control Register |
| OWA_FSTA | 0x0018 | OWA FIFO Status Register |
| OWA_INT | 0x001C | OWA Interrupt Control Register |
| OWA_TX_FIFO | 0x0020 | OWA TX FIFO Register |
| OWA_TX_CNT | 0x0024 | OWA TX Counter Register |
| OWA_RX_CNT | 0x0028 | OWA RX Counter Register |
| OWA_TX_CHSTA0 | 0x002C | OWA TX Channel Status Register0 |

| Register Name | Offset | Description |
|----------------|--------|--------------------------------------|
| OWA_TX_CHSTA1 | 0x0030 | OWA TX Channel Status Register1 |
| OWA_RXCHSTA0 | 0x0034 | OWA RX Channel Status Register0 |
| OWA_RXCHSTA1 | 0x0038 | OWA RX Channel Status Register1 |
| OWA_EXP_CTL | 0x0040 | OWA Expand Control Register |
| OWA_EXP_ISTA | 0x0044 | OWA Expand Interrupt Status Register |
| OWA_EXP_INFO_0 | 0x0048 | OWA Expand Infomation Register0 |
| OWA_EXP_INFO_1 | 0x004C | OWA Expand Infomation Register1 |
| OWA_EXP_DBG_0 | 0x0050 | OWA Expand Debug Register0 |
| OWA_EXP_DBG_1 | 0x0054 | OWA Expand Debug Register1 |

8.3.5 Register Description

8.3.5.1 0x0000 OWA General Control Register (Default Value: 0x0000_0080)

| Offset: 0x0000 | | | Register Name: OWA_CTL |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:13 | / | / | / |
| 12 | R/WAC | 0x0 | RST_RX Reset RX 0: Normal 1: Reset Self clear to '0'. |
| 11:8 | / | / | / |
| 7 | R | 0x1 | Reserved |
| 6:3 | / | / | / |
| 2 | R/W | 0x0 | LOOP Loopback Test 0: Normal Mode 1: Loopback Test When the bit is set to '1', the DOUT and DIN need be connected. |

| Offset: 0x0000 | | | Register Name: OWA_CTL |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 1 | R/W | 0x0 | <p>GEN</p> <p>Global Enable</p> <p>Disabling this bit overrides the operations of enabling and flushing all FIFOs by any other blocks or channels.</p> <p>0: Disabled</p> <p>1: Enabled</p> |
| 0 | R/W | 0x0 | <p>RST_TX</p> <p>Reset TX</p> <p>0: Normal</p> <p>1: Reset</p> <p>Self clear to 0.</p> |

8.3.5.2 0x0004 OWA TX Configure Register (Default Value: 0x0000_00F0)

| Offset: 0x0004 | | | Register Name: OWA_TX_CFG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R/W | 0x0 | <p>TX_SINGLE_MODE</p> <p>Tx Single Channel Mode</p> <p>0: Disabled</p> <p>1: Enabled</p> |
| 30:18 | / | / | / |
| 17 | R/W | 0x0 | <p>ASS</p> <p>Audio Sample Select when TX FIFO Underrun</p> <p>0: Sending 0</p> <p>1: Sending the last audio</p> <p>Note: This bit is only valid in PCM mode.</p> |
| 16 | R/W | 0x0 | <p>TX_AUDIO</p> <p>TX Data Type</p> <p>0: Linear PCM (Valid bit of both sub-frame set to 0)</p> <p>1: Non-audio (Valid bit of both sub-frame set to 1)</p> |
| 15:9 | / | / | / |
| 8:4 | R/W | 0xF | <p>TX_RATIO</p> <p>TX Clock Divide Ratio</p> <p>Clock divide ratio = TX_RATIO + 1</p> <p>$F_s = PLL_AUDIO / [(TX_RATIO + 1) * 64 * 2]$</p> |

| Offset: 0x0004 | | | Register Name: OWA_TX_CFG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 3:2 | R/W | 0x0 | TX_SF TX Sample Format 00: 16 bits 01: 20 bits 10: 24 bits 11: Reserved |
| 1 | R/W | 0x0 | TX_CHM CHSTMODE 0: Channel status A and B set to 0 1: Channel status A and B generated from TX_CHSTA |
| 0 | R/W | 0x0 | TXEN TX Enable 0: Disabled 1: Enabled |

8.3.5.3 0x0008 OWA RX Configure Register (Default Value: 0x0000_0000)

| Offset: 0x0008 | | | Register Name: OWA_RX_CFG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:5 | / | / | / |
| 4 | R | 0x0 | RX_LOCK_FLAG RX Lock Flag 0: Unlocked 1: Locked |
| 3 | R/W | 0x0 | RX_CHST_SRC RX Channel State Source Select 0: RX_CH_STA register holds status from Channel A 1: RX_CH_STA register holds status from Channel B |
| 2 | / | / | / |
| 1 | R/W | 0x0 | CHST_CP Channel Status Capture 0: Idle or Capture End 1: Capture Channel Status Start The field must be set to 1 at each operation (such as recording). When set to '1', the system starts to capture the channel status. When finished, the bit will automatically turn to '0'. |

| Offset: 0x0008 | | | Register Name: OWA_RX_CFG |
|----------------|------------|-------------|-----------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 0 | R/W | 0x0 | RXEN 0: Disabled 1: Enabled |

8.3.5.4 0x000C OWA Interrupt Status Register (Default Value: 0x0000_0010)

| Offset: 0x000C | | | Register Name: OWA_ISTA |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:19 | / | / | / |
| 18 | R/W1C | 0x0 | RX_LOCK_INT RX Lock Interrupt 0: No Pending IRQ 1: RX Lock Pending Interrupt (RX_LOCK_FLAG turns from 0 to 1) Write '1' to clear this interrupt. |
| 17 | R/W1C | 0x0 | RX_UNLOCK_INT RX Unlock Pending Interrupt 0: No Pending IRQ 1: RX Unlock Pending Interrupt (RX_LOCK_FLAG turns from 0 to 1) Write 1 to clear this interrupt. |
| 16 | R/W1C | 0x0 | RX_PARERRI_INT RX Parity Error Pending Interrupt 0: No Pending IRQ 1: RX Parity Error Pending Interrupt Write "1" to clear this interrupt. |
| 15:7 | / | / | / |
| 6 | R/W1C | 0x0 | TXU_INT TX FIFO Underrun Pending Interrupt 0: No Pending IRQ 1: FIFO Underrun Pending Interrupt Writing "1" to clear this interrupt. |

| Offset: 0x000C | | | Register Name: OWA_ISTA |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 5 | R/W1C | 0x0 | TXO_INT TX FIFO Overrun Pending Interrupt 0: No Pending IRQ 1: FIFO Overrun Pending Interrupt Writing "1" to clear this interrupt. |
| 4 | R/W1C | 0x1 | TXE_INT TX FIFO Empty Pending Interrupt 0: No Pending IRQ 1: FIFO Empty Pending Interrupt Writing "1" to clear this interrupt or automatically clear if the interrupt condition fails. |
| 3:2 | / | / | / |
| 1 | R/W1C | 0x0 | RXO_INT RXFIFO Overrun Pending Interrupt 0: RXFIFO Overrun Pending Write '1' to clear this interrupt. |
| 0 | R/W1C | 0x0 | RXA_INT RXFIFO Available Pending Interrupt 0: No Pending IRQ 1: Data Available Pending IRQ Write '1' to clear this interrupt or automatically clear if the interrupt condition fails. |

8.3.5.5 0x0010 OWA RXFIFO Register (Default Value: 0x0000_0000)

| Offset: 0x0010 | | | Register Name: OWA_RXFIFO |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | RX_DATA The host can get one sample by reading this register, A channel data is first, and then the B channel data. |

8.3.5.6 0x0014 OWA FIFO Control Register (Default Value: 0x0004_0200)

| Offset: 0x0014 | | | Register Name: OWA_FCTL |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R/W | 0x0 | HUB_EN Audio Hub Enable The bit takes effect only when the TXEN is set to 1. Audio codec/I2S0/I2S1/I2S2/OWA TXFIFO Hub Enable. 0: Disabled 1: Enabled |
| 30 | R/W1C | 0x0 | FTX Write '1' to flush TXFIFO, self clear to '0'. |
| 29 | R/W1C | 0x0 | FRX Write '1' to flush RXFIFO, self clear to '0'. |
| 28:22 | / | / | / |
| 21 | R/W | 0x0 | RX_SYNC_EN_START The bit takes effect only when the RX_SYNC_EN is set to 1. Audio Codec/I2S0/I2S1/I2S2/DMIC/OWA RX Synchronize Enable Start. 0: Disabled 1: Enabled |
| 20 | R/W | 0x0 | RX_SYNC_EN OWA RX Synchronize Enable 0: Disabled 1: Enabled |
| 19:12 | R/W | 0x40 | TXTL TX FIFO Empty Trigger Level Interrupt and DMA request trigger level for TX FIFO normal condition. Trigger Level = TXTL |
| 11 | / | / | / |
| 10:4 | R/W | 0x20 | RXTL RX FIFO Trigger Level Interrupt and DMA request trigger level for RX FIFO normal condition. Trigger Level = RXTL + 1 |
| 3 | / | / | / |

| Offset: 0x0014 | | | Register Name: OWA_FCTL |
|----------------|------------|-------------|--|

8.4 Audio Codec

8.4.1 Overview

The Audio Codec is high-performance audio encoder and decoder module which supports DAC/ADC, dynamic range controller (DRC) and dynamic voltage controller (DVC) functions.

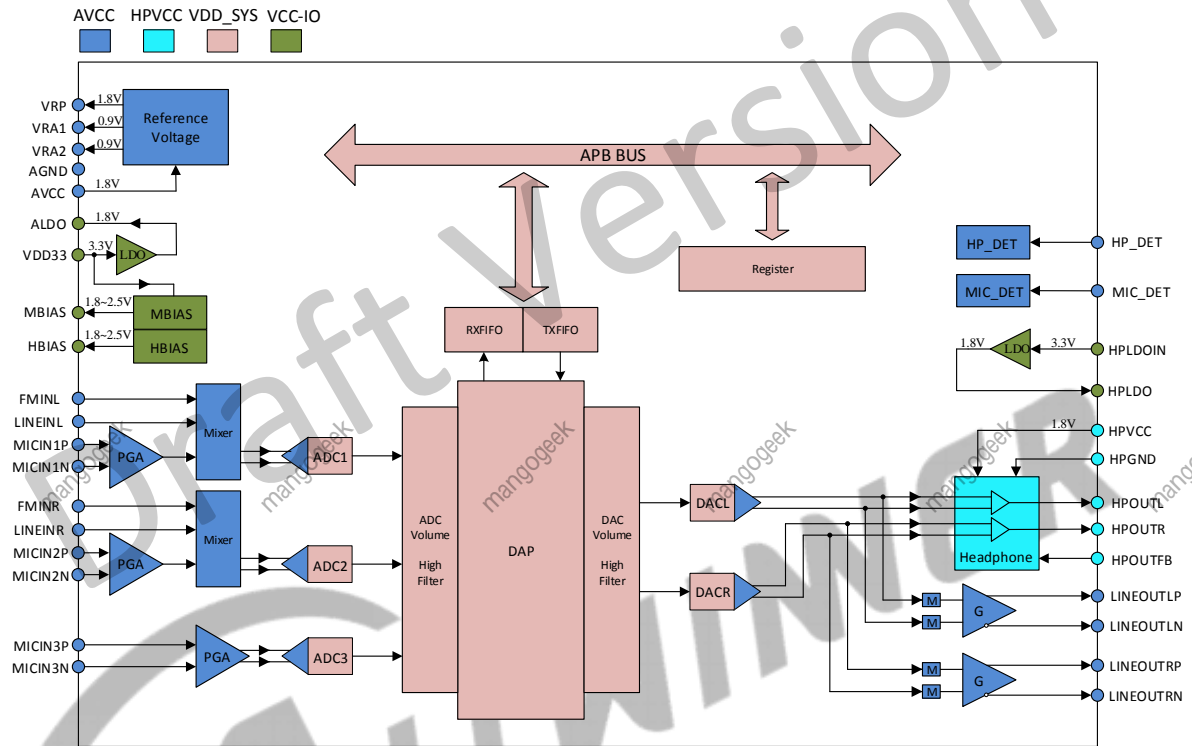

The Audio Codec has the following features:

- Two audio digital-to-analog (DAC) channels
 - Supports the DAC sample rate from 8 kHz to 192 kHz
 - 100 ± 2 dB SNR@A-weight, -85 ± 3 dB THD + N
 - Supports 16-bit and 20-bit audio sample resolution
- Two audio outputs
 - One stereo headphone output: HPOUTL/R
 - One stereo differential lineout output: LINEOUTLP/N and LINEOUTRP/N
- Three audio analog-to-digital (ADC) channels
 - Supports the ADC sample rate from 8 kHz to 48 kHz
 - 95 ± 3 dB SNR@A-weight, -80 ± 3 dB THD + N
 - Supports 16-bit and 20-bit audio sample resolution
- Five audio inputs
 - Three differential microphone inputs: MICIN1P/1N, MICIN2P/2N, MICIN3P/3N
 - One stereo LINEIN input: LINEINL/R
 - One stereo FMIN input: FMINL/R
- Stereo headphone driver
 - 95 ± 3 dB SNR@A-weight
 - Output Level $0.55 V_{rms}@10k \text{ Ohm}/THD+N -77 \pm 3$ dB, $0.37 V_{rms}@16 \text{ Ohm}/THD+N -40$ dB
- Supports Dynamic Range Controller (DRC) adjusting the ADC recording and DAC playback
- One 128x20-bit FIFO for DAC data transmit, one 128x20-bit FIFO for ADC data receive
- Programmable FIFO thresholds
- Supports interrupts and DMA

8.4.2 Block Diagram

The following figure shows the block diagram of Audio Codec.

Figure 8-24 Audio Codec Block Diagram

8.4.3 Functional Description

8.4.3.1 External Signals

Table 8-15 Audio Codec External Signals

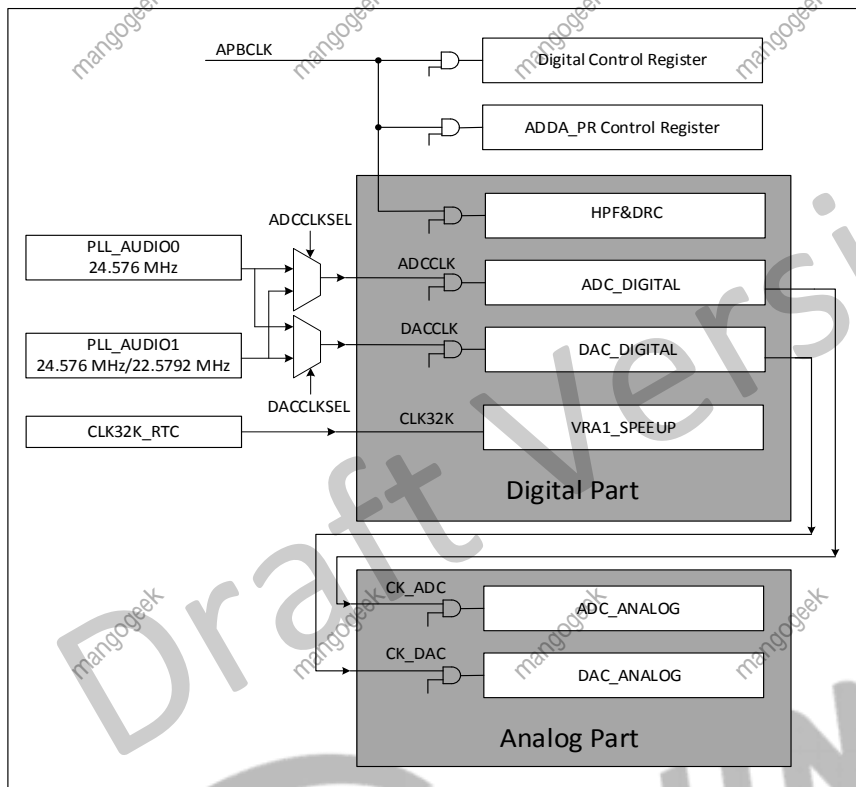

| Signal | Type | Description |
|---------|------|--------------------------------------|
| MICIN1P | AI | Positive Differential Input for MIC1 |
| MICIN1N | AI | Negative Differential Input for MIC1 |
| MICIN2P | AI | Positive Differential Input for MIC2 |
| MICIN2N | AI | Negative Differential Input for MIC2 |
| MICIN3P | AI | Positive Differential Input for MIC3 |
| MICIN3N | AI | Negative Differential Input for MIC3 |
| FMINL | AI | FMIN Left Input |
| FMINR | AI | FMIN Right Input |
| LINEINL | AI | LINEIN Left Single-End Input |

| Signal | Type | Description |
|-----------|------|--|
| LINEINR | AI | LINEIN Right Single-End Input |
| LINEOUTLN | AO | Lineout Left Channel Negative Differential Output |
| LINEOUTLP | AO | Lineout Left Channel Positive Differential Output |
| LINEOUTRN | AO | Lineout Right Channel Negative Differential Output |
| LINEOUTRP | AO | Lineout Right Channel Positive Differential Output |
| HPOUTL | AO | Headphone Light Output |
| HPOUTR | AO | Headphone Right Output |
| HPOUTFB | AI | Pseudo Differential Headphone Ground Reference |
| HP-DET | AI | Headphone Jack Detect |
| HBIAS | AO | Second Bias Voltage Output for Headset Microphone |
| MBIAS | AO | First Bias Voltage Output for Main Microphone |
| MIC-DET | AI | Headphone MIC Detect |
| VRA1 | AO | Internal Reference Voltage |
| VRA2 | AO | Internal Reference Voltage |
| HPLDO | P | Headphone LDO 1.8 V (bonding with HPVCC) |
| HPLDOIN | P | Headphone LDO Input 3.3 V |
| HPVCC | P | Headphone Power 1.8 V |
| VDD33 | P | Analog Power 3.3 V |
| ALDO | P | Analog Power 1.8 V (bonding with AVCC) |
| AVCC | P | Analog Power |
| AGND | G | Analog Ground |

8.4.3.2 Clock Sources

The following figure describes the clock source of Audio Codec. For clock setting, configuration, and gating information, refer to section 3.2 "[CCU](#)".

Figure 8-25 Audio Codec Clock Diagram

The clock source for the digital part is the PLL_AUDIO0 and PLL_AUDIO1. For the ADC clock, configure [AUDIO CODEC ADC CLK REG](#)[25:24] to select the clock source. For the DAC clock, configure [AUDIO CODEC DAC CLK REG](#)[25:24] to select the clock source. The PK-PK jitter of PLL_AUDIO0 and PLL_AUDIO1 should be less than 200 ps.

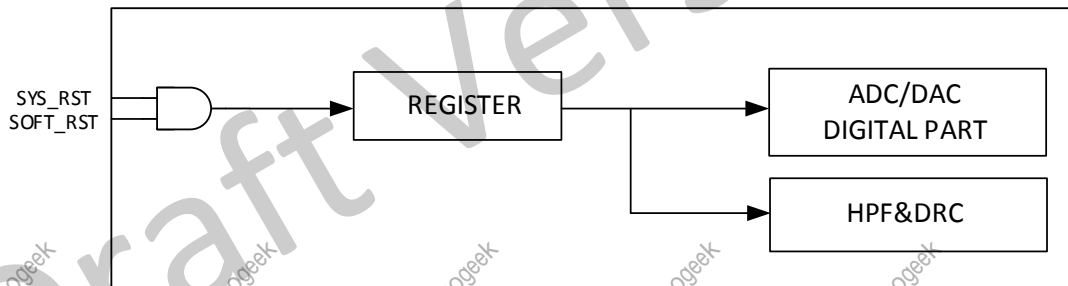

The clock source for the analog part is the CK_ADC and CK_DAC, both of which are divided from the digital part.

8.4.3.3 Reset System

Digital Part Reset System

The following figure shows the reset system of the audio codec digital part.

Figure 8-26 Audio Codec Digital Part Reset System

The SYS_RST comes from the VDD-SYS domain and is produced by the RTC domain. Each domain has the de-bounce to confirm the reset system is strong. For the codec register part, MIX can be reset by the SYS_RST when being powered on or the system soft is writing the reset control logic. The other parts can be reset by the soft configuration through writing the register.

Analog Part Reset System

The following figure shows the reset system of the audio codec analog part.

Figure 8-27 Audio Codec Analog Part Reset System

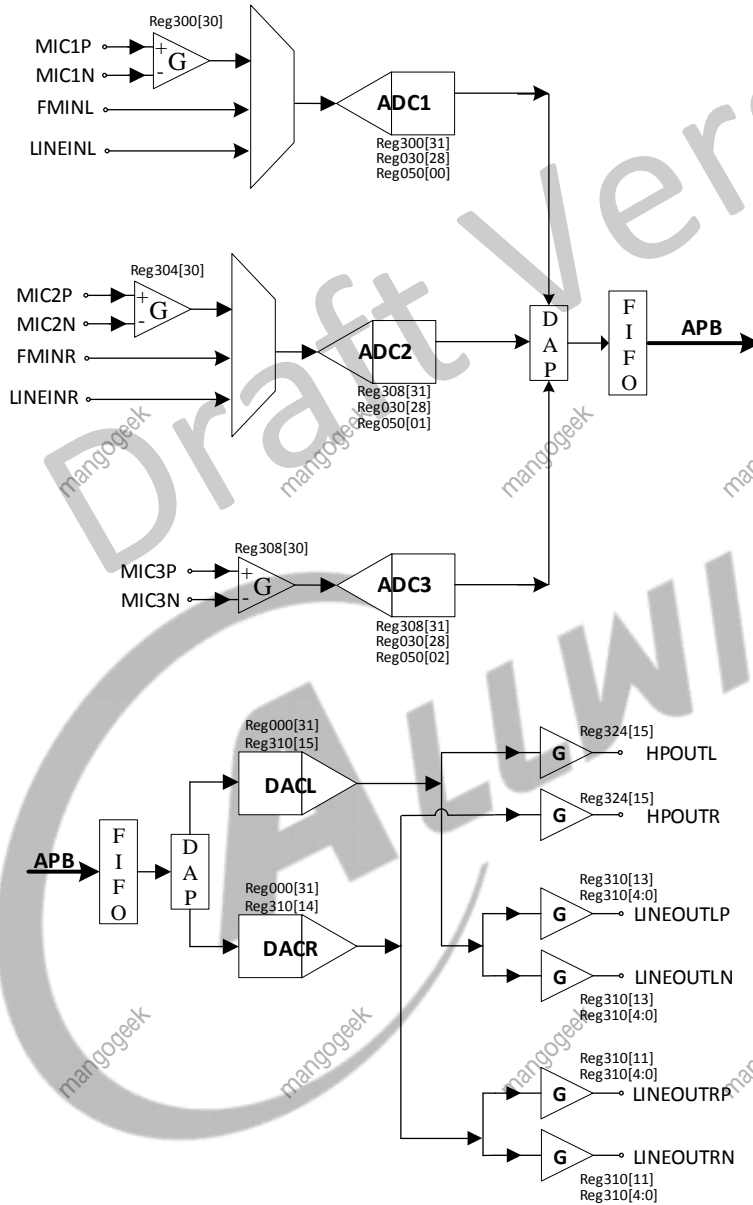

When AVCC is powered on, it sends the AVCC_POR signal. The AVCC_POR signal passes the level shift and RC filter part to the ADDA logic core.

8.4.3.4 Data Path Diagram

The following figure shows a data path of the Audio Codec.

Figure 8-28 Audio Codec Data Path Diagram

8.4.3.5 Three ADCs

The three ADCs are used for recording stereo sound and a reference signal. The sample rates of the three ADCs are independent of the DAC sample rate. The digital ADC part can be enabled or disabled by the bit[28] of the [AC_ADC_FIFO](#) register.

8.4.3.6 Stereo DACs

The stereo DAC sample rate can be configured by setting the register. To save power, the analog DACL can be enabled or disabled by setting the bit[15] of the [DAC_REG](#) register, and the analog DACR can be enabled or disabled by setting the bit[14] of the [DAC_REG](#) register. The digital DAC part can be enabled or disabled by the bit[31] of the [AC_DAC_DPC](#) register.

8.4.3.7 Analog Audio Input Path

The Audio Codec supports 5 analog audio input paths:

- MICIN1P/N
- MICIN2P/N
- MICIN3P/N
- LINEINL/R
- FMINL/R

MICIN1P/N, LINEINL, FMINL provide differential input that can be mixed into the ADC1 record mixer. MICIN2P/N, LINEINR, FMINR provide differential input that can be mixed into the ADC2 record mixer. MICIN3P/N provides differential input. The MICIN is a high impedance, low capacitance input suitable for connecting to various differential microphones of different dynamics and sensitivity. The gain for each pre-amplifier can be set independently. MBIAS provides the reference voltage for electret condenser type (ECM) microphones.

8.4.3.8 Analog Audio Output Path

The Audio Codec has 2 analog output paths:

- LINEOUTLP/N, LINEOUTRP/N
- HPOUTL/R

The headphone PA is powered up or down by HP_REG[bit15] (HPPA_EN). HPOUTL/R can drive a 16R or 32R headphone load without DC capacitors by using Charge Pump to generate the negative rails. HP-FB is the ground loop noise rejection feedback. HBIAS provides reference voltage for electret condenser type (ECM) microphones.

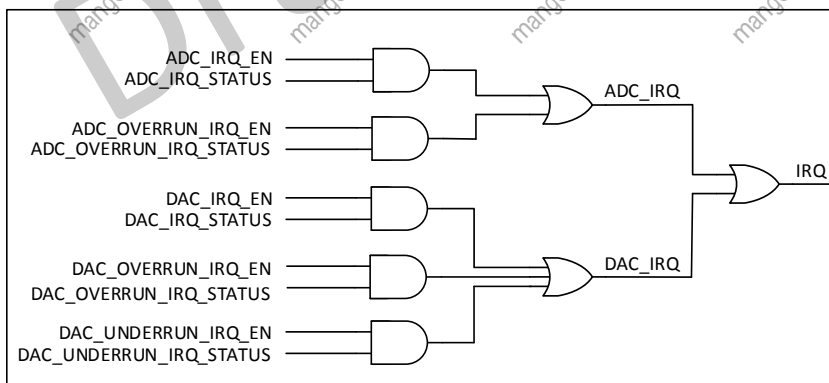

Figure 8-29 Headphone Output Application

8.4.3.9 Interrupts

The Audio Codec has two interrupts. The following figure describes the Audio Codec interrupt system.

Figure 8-30 Audio Codec Interrupt System

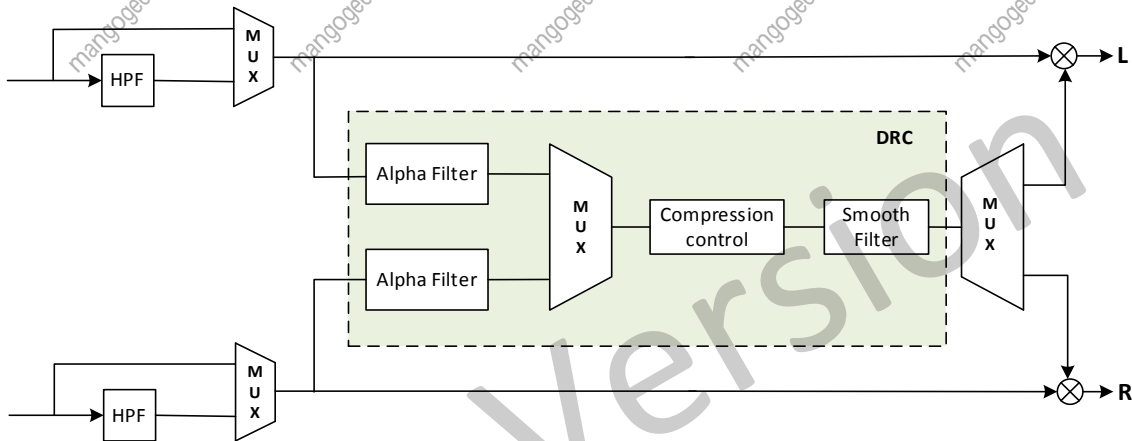

8.4.3.10 Digital Audio Processor (DAP)

The DAP module is used to remove the DC offset and automatically adjusts the volume to a flatten volume level. It mainly consists of two HPF and one DRC.

The following figure shows the DAP data flow.

Figure 8-31 DAP Data Flow

HPF Function

The DAP has individual channel high pass filter (HPF, -3 dB cutoff < 1 Hz) that can be enabled and disabled. The filter cutoff frequency is less than 1 Hz that can be removed DC offset from ADC recording. The HPF can also be bypassed.

Figure 8-32 HPF Logic Structure

DRC Function

The DRC scheme has three thresholds, three offsets, and four slopes (all programmable). There is one ganged DRC for the left and right channels. The following figure shows the diagram of DRC input/output.

Figure 8-33 DRC Block Diagram

Figure 8-34 DRC Static Curve Parameters

Professional-quality dynamic range compression automatically adjusts the volume to flatten volume level.

One DRC for left/right and one DRC for the subwoofer.

Each DRC has an adjustable threshold, offset, and compression levels, programmable energy, attack, and decay time constants.

Transparent compression: Compressors can attack fast enough to avoid apparent clipping before engaging, and decay times can be set slow enough to avoid pumping.

Configure the DRC parameters according to the following guidelines:

- **Number format**

The Number format is N.M which means there are N bits to the left of the decimal point including the sign bit and M bits to the right of the decimal point. For example, Numbers formatted 9.23 means that there are 9 bits at the left of the decimal point and 23 bits at the right decimal point.

- **Energy Filter**

The following figure shows the structure of the energy filter.

Figure 8-35 Energy Filter Structure

The Energy Filter is to estimate the RMS value of the audio data stream into DRC and has two parameters, which determine the time window over which RMS to be made. The parameter is computed by

$$\alpha = 1 - e^{-2.2Ts/ta}$$

For the Compression Control, there are ten parameters (ET, CT, LT, Ke, Kn, Kc, KI, OPL, OPC, and OPE), which are all programmable, and the computation will be explained as follows.

- **Threshold Parameter Computation (T parameter)**

The threshold is the value that determines the signal to be compressed or not. When the RMS of the signal is larger than the threshold, the signal will be compressed. The value of threshold input to the coefficient register is computed by

$$Tin = -\frac{T_{dB}}{6.0206}$$

Where, T_{dB} must less than zero, the positive value is illegal.

For example, it is desired to set CT = -40 dB, then the Tin require to set CT to -40 dB is $CTin = -(-40 \text{ dB})/6.0206 = 6.644$, CT_{in} is entered as a 32-bit number in 8.24 format.

Therefore, $CT_{in} = 6.644 = 0000\ 0110.1010\ 0100\ 1101\ 0011\ 1100\ 0000 = 0x06A4\ D3C0$ in 8.24 format.

- **Slope Parameter Computation (K parameter)**

The K is the slope within the compression region. For example, an n: 1 compression means that an output increase of 1 dB is for n dB RMS input. The k input to the coefficient ram is computed by $K = \frac{1}{n}$

Where, n is from 1 to 50, and must be an integer.

For example, it is desired to set to 2:1, then the Kc requires to set to 2:1, is $Kc = 1/2 = 0.5$, Kc is entered as a 32-bit number in 8.24 format.

Therefore, $Kc = 0.5 = 0000\ 0000.1000\ 0000\ 0000\ 0000\ 0000\ 0000 = 0x0080\ 0000$ in 8.24 format.

- **Gain Smooth Filter**

The Gain Smooth Filter is to smooth the gain and control the ratio of gain increase and decrease. The decay time and attack are shown in Figure 8-36. The structure of the Gain Smooth filter is also the Alpha

filter, so the rise time computation is the same as the Energy filter which is $\alpha = 1 - e^{-2.2Ts/ta}$

Figure 8-36 Gain Smooth Filter

8.4.4 Programming Guidelines

8.4.4.1 Record Process

In recording mode, the analog audio signals are recorded from the microphones at the specified sample rate, processed by the ADC, and then transferred to the DRAM via the DMA.

Step 1 Codec initialization: configure [AUDIO CODEC BGR REG](#) to open the audio codec bus clock gating and de-assert bus reset; configure [AUDIO CODEC ADC CLK REG](#) and [PLL AUDIO0 CTRL REG](#) to configure PLL_Audio0 frequency and enable PLL_Audio0. For details, refer to section 3.2 “CCU”.

Step 2 Configure the sample rate and data transfer format, then open the ADC.

Step 3 Configure the DMA and DMA request.

Step 4 Enable the ADC DRQ and DMA.

8.4.4.2 Playback Process

In playback mode, the audio data are transferred from the DRAM via DMA, processed by the DAC, and finally output via the analog interface.

Step 1 Codec initialization: configure [AUDIO CODEC BGR REG](#) to open the audio codec bus clock gating and de-assert bus reset; configure [AUDIO CODEC DAC CLK REG](#) and [PLL AUDIO1 CTRL REG](#) to configure PLL_Audio1 frequency and enable PLL_Audio1. For details, refer to section 3.2 “CCU”

Step 2 Configure the sample rate and data transfer format, then open the DAC.

Step 3 Configure the DMA and DMA request.

Step 4 Enable the DAC DRQ and DMA.

8.4.5 Register List

| Module Name | Base Address |
|-------------|--------------|
| Audio Codec | 0x02030000 |

| Register Name | Offset | Description |
|-----------------------|--------|------------------------------------|
| AC_DAC_DPC | 0x0000 | DAC Digital Part Control Register |
| DAC_VOL_CTRL | 0x0004 | DAC Volume Control Register |
| AC_DAC_FIFOC | 0x0010 | DAC FIFO Control Register |
| AC_DAC_FIFOS | 0x0014 | DAC FIFO Status Register |
| AC_DAC_TXDATA | 0x0020 | DAC TX DATA Register |
| AC_DAC_CNT | 0x0024 | DAC TX FIFO Counter Register |
| AC_DAC_DG | 0x0028 | DAC Debug Register |

| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15:0 | R/W | 0x2C3F | DAC_DRC_MNGLS The min gain setting, which is determined by equation $MXG_{in}=MNG/6.0206$. The format is 8.24 and must $-60\text{ dB} \leq MNG \leq -40\text{ dB}$ (The default value is -40 dB) |

8.4.6.61 0x01AC DAC DRC Expander Smooth Time High Coef Register (Default Value: 0x0000_0000)

| Offset: 0x01AC | | | Register Name: AC_DAC_DRC_EPSHC |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:11 | / | / | / |
| 10:0 | R/W | 0x0000 | DAC_DRC_EPSHC The gain smooth filter release and attack time parameter setting in expander region, which are determined by the equation that $RT = 1 - \exp(-2.2Ts/tr)$. The format is 3.24. (The default value is 30 ms) |

8.4.6.62 0x01B0 DAC DRC Expander Smooth Time Low Coef Register (Default Value: 0x0000_640C)

| Offset: 0x01B0 | | | Register Name: AC_DAC_DRC_EPSLC |
|----------------|------------|-------------|---------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |

| Offset: 0x01B0 | | | Register Name: AC_DAC_DRC_EPSLC |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 15:0 | R/W | 0x640C | DAC_DRC_EPSLC The gain smooth filter release and attack time parameter setting in expander region, which are determined by the equation that $RT = 1 - \exp(-2.2Ts/tr)$. The format is 3.24. (The default value is 30 ms) |

8.4.6.63 0x01B8 DAC DRC HPF Gain High Coef Register (Default Value: 0x0000_0100)

| Offset: 0x01B8 | | | Register Name: AC_DAC_DRC_HPFHGAIN |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:11 | / | / | / |
| 10:0 | R/W | 0x100 | DAC_DRC_HPFHGAIN The gain of HPF coefficient. The format is 3.24. (gain = 1) |

8.4.6.64 0x01BC DAC DRC HPF Gain Low Coef Register (Default Value: 0x0000_0000)

| Offset: 0x01BC | | | Register Name: AC_DAC_DRC_HPFLGAIN |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15:0 | R/W | 0x0000 | DAC_DRC_HPFLGAIN The gain of HPF coefficient. The format is 3.24. (gain = 1) |

8.4.6.65 0x0200 ADC DRC High HPF Coef Register (Default Value: 0x0000_00FF)

| Offset: 0x0200 | | | Register Name: AC_ADC_DRC_HHPFC |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:11 | / | / | / |
| 10:0 | R/W | 0xFF | ADC_DRC_HHPFC HPF coefficient setting and the data is 3.24 format. |

8.4.6.66 0x0204 ADC DRC Low HPF Coef Register (Default Value: 0x0000_FAC1)

| Offset: 0x0204 | | | Register Name: AC_ADC_DRC_LHPFC |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15:0 | R/W | 0xFAC1 | HPF coefficient setting and the data is 3.24 format. |

8.4.6.67 0x0208 ADC DRC Control Register (Default Value: 0x0000_0080)

| Offset: 0x0208 | | | Register Name: AC_ADC_DRC_CTRL |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15 | R | 0x0 | <p>ADC_DRC_DELAY_BUF_OUTPUT_STATE</p> <p>DRC delay buffer data output state when The DRC delay function is enabled and the DRC function is disabled. After disabled DRC function and this bit goes to 0, the user should write the DRC delay function bit to 0.</p> <p>0: Not completed 1: Completed</p> |
| 14:10 | / | / | / |
| 13:8 | R/W | 0x0 | <p>ADC_DRC_SIGNAL_DELAY_TIME_SET</p> <p>Signal delay time setting</p> <p>6'h00: (8x1) fs 6'h01: (8x2) fs 6'h02: (8x3) fs ----- 6'h2e: (8*47) fs 6'h2f: (8*48) fs 6'h30 -- 6'h3f: (8*48) fs</p> <p>Delay time = 8*(n + 1) fs, n < 6'h30; When the delay function is disabled, the signal delay time is unused.</p> |
| 7 | R/W | 0x1 | <p>ADC_DRC_DELAY_BUF_EN</p> <p>The delay buffer use or not when the DRC is disabled and the DRC buffer data output completely.</p> <p>0: Do not use the buffer 1: Use the buffer</p> |

| Offset: 0x0208 | | | Register Name: AC_ADC_DRC_CTRL |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 6 | R/W | 0x0 | <p>ADC_DRC_GAIN_MAX_LIMIT_EN</p> <p>DRC gain max limit enable</p> <p>0: Disabled</p> <p>1: Enabled</p> |
| 5 | R/W | 0x0 | <p>ADC_DRC_GAIN_MIN_LIMIT_EN</p> <p>DRC gain min limit enable</p> <p>When this function is enabled, it will overwrite the noise detect function.</p> <p>0: Disabled</p> <p>1: Enabled</p> |

| Offset: 0x0208 | | | Register Name: AC_ADC_DRC_CTRL |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 0 | R/W | 0x0 | ADC_DRC_ET_EN DRC ET enable 0: Disabled 1: Enabled When the bit is disabled, Ke and OPE parameter is unused. |

8.4.6.68 0x020C ADC DRC Left Peak Filter High Attack Time Coef Register (Default Value: 0x0000_000B)

| Offset: 0x020C | | | Register Name: AC_ADC_DRC_LPFHAT |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:11 | / | / | / |
| 10:0 | R/W | 0x000B | ADC_DRC_LPFHAT The left peak filter attack time parameter setting, which is determined by the equation that $AT = 1 - \exp(-2.2T_s/ta)$. The format is 3.24. (The default value is 1 ms) |

8.4.6.69 0x0210 ADC DRC Left Peak Filter Low Attack Time Coef Register (Default Value: 0x0000_77BF)

| Offset: 0x0210 | | | Register Name: AC_ADC_DRC_LPFLAT |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15:0 | R/W | 0x77BF | ADC_DRC_LPFLAT The left peak filter attack time parameter setting, which is determined by the equation that $AT = 1 - \exp(-2.2T_s/ta)$. The format is 3.24. (The default value is 1 ms) |

8.4.6.70 0x0214 ADC DRC Right Peak Filter High Attack Time Coef Register (Default Value: 0x0000_000B)

| Offset: 0x0214 | | | Register Name: AC_ADC_DRC_RPFHAT |
|----------------|------------|-------------|----------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |

| Offset: 0x0214 | | | Register Name: AC_ADC_DRC_RPFHAT |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 15:0 | R/W | 0x000B | ADC_DRC_RPFHAT The right peak filter attack time parameter setting, which is determined by the equation that $AT = 1 - \exp(-2.2T_s/ta)$. The format is 3.24. (The default value is 1 ms) |

8.4.6.71 0x0218 ADC DRC Right Peak Filter Low Attack Time Coef Register (Default Value: 0x0000_77BF)

| Offset: 0x0218 | | | Register Name: AC_ADC_DRC_RPFLAT |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15:0 | R/W | 0x77BF | ADC_DRC_RPFLAT The right peak filter attack time parameter setting, which is determined by the equation that $AT = 1 - \exp(-2.2T_s/ta)$. The format is 3.24. (The default value is 1 ms) |

8.4.6.72 0x021C ADC DRC Left Peak Filter High Release Time Coef Register (Default Value: 0x0000_00FF)

| Offset: 0x021C | | | Register Name: AC_ADC_DRC_LPFHRT |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:11 | / | / | / |
| 10:0 | R/W | 0x00FF | ADC_DRC_LPFHRT The left peak filter release time parameter setting, which is determined by the equation that $RT = \exp(-2.2T_s/tr)$. The format is 3.24. (The default value is 100 ms) |

8.4.6.73 0x0220 ADC DRC Left Peak Filter Low Release Time Coef Register (Default Value: 0x0000_E1F8)

| Offset: 0x0220 | | | Register Name: AC_ADC_DRC_LPFLRT |
|----------------|------------|-------------|----------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |

| Offset: 0x0220 | | | Register Name: AC_ADC_DRC_LPFLRT |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 15:0 | R/W | 0xE1F8 | ADC_DRC_LPFLRT The left peak filter release time parameter setting, which is determined by the equation that $RT = \exp(-2.2T_s/tr)$. The format is 3.24. (The default value is 100 ms) |

8.4.6.74 0x0224 ADC DRC Right Peak Filter High Release Time Coef Register (Default Value: 0x0000_00FF)

| Offset: 0x0224 | | | Register Name: AC_ADC_DRC_RPFHRT |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15:0 | R/W | 0x00FF | ADC_DRC_RPFHRT The right peak filter release time parameter setting, which is determined by the equation that $RT = \exp(-2.2T_s/tr)$. The format is 3.24. (The default value is 100 ms) |

8.4.6.75 0x0228 ADC DRC Right Peak Filter Low Release Time Coef Register (Default Value: 0x0000_E1F8)

| Offset: 0x0228 | | | Register Name: AC_ADC_DRC_RPFLRT |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15:0 | R/W | 0xE1F8 | ADC_DRC_RPFLRT The right peak filter release time parameter setting, which is determined by the equation that $RT = \exp(-2.2T_s/tr)$. The format is 3.24. (The default value is 100 ms) |

8.4.6.76 0x022C ADC DRC Left RMS Filter High Coef Register (Default Value: 0x0000_0001)

| Offset: 0x022C | | | Register Name: AC_ADC_DRC_LRMSHAT |
|----------------|------------|-------------|-----------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:11 | / | / | / |

| Offset: 0x022C | | | Register Name: AC_ADC_DRC_LRMSHAT |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 10:0 | R/W | 0x0001 | ADC_DRC_LRMSHAT The left RMS filter average time parameter setting, which is determined by the equation that $AT = 1 - \exp(-2.2T_s/t_{av})$. The format is 3.24. (The default value is 10 ms) |

8.4.6.77 0x0230 ADC DRC Left RMS Filter Low Coef Register (Default Value: 0x0000_2BAF)

| Offset: 0x0230 | | | Register Name: AC_ADC_DRC_LRMSLAT |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15:0 | R/W | 0x2BAF | ADC_DRC_LRMSLAT The left RMS filter average time parameter setting, which is determined by the equation that $AT = 1 - \exp(-2.2T_s/t_{av})$. The format is 3.24. (The default value is 10 ms) |

8.4.6.78 0x0234 ADC DRC Right RMS Filter High Coef Register (Default Value: 0x0000_0001)

| Offset: 0x0234 | | | Register Name: AC_ADC_DRC_RRMSHAT |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:11 | / | / | / |
| 10:0 | R/W | 0x0001 | ADC_DRC_RRMSHAT The right RMS filter average time parameter setting, which is determined by the equation that $AT = 1 - \exp(-2.2T_s/t_{av})$. The format is 3.24. (The default value is 10 ms) |

8.4.6.79 0x0238 ADC DRC Right RMS Filter Low Coef Register (Default Value: 0x0000_2BAF)

| Offset: 0x0238 | | | Register Name: AC_ADC_DRC_RRMSLAT |
|----------------|------------|-------------|-----------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |

| Offset: 0x0238 | | | Register Name: AC_ADC_DRC_RRMSLAT |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 15:0 | R/W | 0x2BAF | ADC_DRC_RRMSLAT The right RMS filter average time parameter setting, which is determined by the equation that $AT = 1 - \exp(-2.2T_s/\tau_{av})$. The format is 3.24. (The default value is 10 ms) |

8.4.6.80 0x023C ADC DRC Compressor Theshold High Setting Register (Default Value: 0x0000_06A4)

| Offset: 0x023C | | | Register Name: AC_ADC_DRC_HCT |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15:0 | R/W | 0x06A4 | ADC_DRC_HCT The compressor threshold setting, which is set by the equation that $CT_{in} = -CT/6.0206$. The format is 8.24. (The default value is -40 dB) |

8.4.6.81 0x0240 ADC DRC Compressor Slope High Setting Register (Default Value: 0x0000_D3C0)

| Offset: 0x0240 | | | Register Name: AC_ADC_DRC_LCT |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15:0 | R/W | 0xD3C0 | ADC_DRC_LCT The compressor threshold setting, which is set by the equation that $CT_{in} = -CT/6.0206$. The format is 8.24. (The default value is -40 dB) |

8.4.6.82 0x0244 ADC DRC Compressor Slope High Setting Register (Default Value: 0x0000_0080)

| Offset: 0x0244 | | | Register Name: AC_ADC_DRC_HKC |
|----------------|------------|-------------|-------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |

| Offset: 0x0244 | | | Register Name: AC_ADC_DRC_HKC |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 15:0 | R/W | 0x0080 | ADC_DRC_HKC The slope of the compressor which is determined by the equation that $K_c = 1/R$. R is the ratio of the compressor, which is always an integer. The format is 8.24. (The default value is <2:1>) |

8.4.6.83 0x0248 ADC DRC Compressor Slope Low Setting Register (Default Value: 0x0000_0000)

| Offset: 0x0248 | | | Register Name: AC_ADC_DRC_LKC |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15:0 | R/W | 0x0000 | ADC_DRC_LKC The slope of the compressor, which is determined by the equation that $K_c = 1/R$. R is the ratio of the compressor, which is always an integer. The format is 8.24. (The default value is <2:1>) |

8.4.6.84 0x024C ADC DRC Compressor High Output at Compressor Threshold Register (Default Value: 0x0000_F95B)

| Offset: 0x024C | | | Register Name: AC_ADC_DRC_HOPC |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15:0 | R/W | 0xF95B | ADC_DRC_HOPC The output of the compressor, which is determined by the equation $-OPC/6.0206$. The format is 8.24. (The default value is -40 dB) |

8.4.6.85 0x0250 ADC DRC Compressor Low Output at Compressor Threshold Register (Default Value: 0x0000_2C3F)

| Offset: 0x0250 | | | Register Name: AC_ADC_DRC_LOPC |
|----------------|------------|-------------|--------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |

| Offset: 0x0250 | | | Register Name: AC_ADC_DRC_LOPC |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 15:0 | R/W | 0x2C3F | ADC_DRC_LOPC The output of the compressor, which is determined by the equation $OPC/6.0206$. The format is 8.24. (The default value is -40 dB) |

8.4.6.86 0x0254 ADC DRC Limiter Theshold High Setting Register (Default Value: 0x0000_01A9)

| Offset: 0x0254 | | | Register Name: AC_ADC_DRC_HLT |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15:0 | R/W | 0x01A9 | ADC_DRC_HLT The limiter threshold setting, which is set by the equation that $LT_{in} = -LT/6.0206$. The format is 8.24. (The default value is -10 dB) |

8.4.6.87 0x0258 ADC DRC Limiter Theshold Low Setting Register (Default Value: 0x0000_34F0)

|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 15:0 | R/W | 0x0000 | ADC_DRC_LKE The slope of the expander, which is determined by the equation that $K_e = 1/R$. R is the ratio of the expander, which is always an integer and the k_e must be larger than 50. The format is 8.24. (The default value is <1:5>) |

8.4.6.96 0x027C ADC DRC Expander High Output at Expander Threshold Register (Default Value: 0x0000_F45F)

| Offset: 0x027C | | | Register Name: AC_ADC_DRC_HOPE |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15:0 | R/W | 0xF45F | ADC_DRC_HOPE The output of the expander, which is determined by equation $OPE/6.0206$. The format is 8.24. (The default value is -70 dB) |

8.4.6.97 0x0280 ADC DRC Expander Low Output at Expander Threshold Register (Default Value: 0x0000_8D6E)

| Offset: 0x0280 | | | Register Name: AC_ADC_DRC_LOPE |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15:0 | R/W | 0x8D6E | ADC_DRC_LOPE The output of the expander, which is determined by equation $OPE/6.0206$. The format is 8.24. (The default value is -70 dB) |

8.4.6.98 0x0284 ADC DRC Linear Slope High Setting Register (Default Value: 0x0000_0100)

| Offset: 0x0284 | | | Register Name: AC_ADC_DRC_HKN |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15:0 | R/W | 0x0100 | ADC_DRC_HKN The slope of the linear, which is determined by the equation that $K_n = 1/R$. R is the ratio of the linear, which is always an integer. The format is 8.24. (The default value is <1:1>) |

8.4.6.99 0x0288 ADC DRC Linear Slope Low Setting Register (Default Value: 0x0000_0000)

| Offset: 0x0288 | | | Register Name: AC_ADC_DRC_LKN |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15:0 | R/W | 0x0000 | ADC_DRC_LKN The slope of the linear, which is determined by the equation that $K_n = 1/R$. R is the ratio of the linear, which is always an integer. The format is 8.24. (The default value is <1:1>) |

8.4.6.100 0x028C ADC DRC Smooth Filter Gain High Attack Time Coef Register (Default Value: 0x0000_0002)

| Offset: 0x028C | | | Register Name: AC_ADC_DRC_SFHAT |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:11 | / | / | / |
| 10:0 | R/W | 0x0002 | ADC_DRC_SFHAT The smooth filter attack time parameter setting, which is determined by the equation that $AT = 1 - \exp(-2.2T_s/tr)$. The format is 3.24. (The default value is 5 ms) |

8.4.6.101 0x0290 ADC DRC Smooth Filter Gain Low Attack Time Coef Register (Default Value: 0x0000_5600)

| Offset: 0x0290 | | | Register Name: AC_ADC_DRC_SFLAT |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15:0 | R/W | 0x5600 | ADC_DRC_SFLAT The smooth filter attack time parameter setting, which is determined by the equation that $AT = 1 - \exp(-2.2T_s/tr)$. The format is 3.24. (The default value is 5 ms) |

8.4.6.102 0x0294 ADC DRC Smooth Filter Gain High Release Time Coef Register (Default Value: 0x0000_0000)

| Offset: 0x0294 | | | Register Name: AC_ADC_DRC_SFHRT |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:11 | / | / | / |
| 10:0 | R/W | 0x0000 | ADC_DRC_SFHRT The gain smooth filter release time parameter setting, which is determined by the equation that $RT = 1 - \exp(-2.2T_s/tr)$. The format is 3.24. (The default value is 200 ms) |

8.4.6.103 0x0298 ADC DRC Smooth Filter Gain Low Release Time Coef Register (Default Value: 0x0000_0F04)

| Offset: 0x0298 | | | Register Name: AC_ADC_DRC_SFLRT |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15:0 | R/W | 0x0F04 | ADC_DRC_SFLRT The gain smooth filter release time parameter setting, which is determined by the equation that $RT = 1 - \exp(-2.2T_s/tr)$. The format is 3.24. (The default value is 200 ms) |

8.4.6.104 0x029C ADC DRC MAX Gain High Setting Register (Default Value: 0x0000_FE56)

| Offset: 0x029C | | | Register Name: AC_ADC_DRC_MXGHS |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15:0 | R/W | 0xFE56 | ADC_DRC_MXGHS The max gain setting, which is determined by equation $MXG_{in} = MXG/6.0206$. The format is 8.24 and must $-20 \text{ dB} < MXG < 30 \text{ dB}$ (The default value is -10 dB) |

8.4.6.105 0x02A0 ADC DRC MAX Gain Low Setting Register (Default Value: 0x0000_CB0F)

| Offset: 0x02A0 | | | Register Name: AC_ADC_DRC_MXGLS |
|----------------|------------|-------------|---------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |

| Offset: 0x02A0 | | | Register Name: AC_ADC_DRC_MXGLS |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 15:0 | R/W | 0xCB0F | ADC_DRC_MXGLS The max gain setting, which is determined by equation $MXG_{in}=MXG/6.0206$. The format is 8.24 and must $-20\text{ dB} < MXG < 30\text{ dB}$ (The default value is -10 dB) |

8.4.6.106 0x02A4 ADC DRC MIN Gain High Setting Register (Default Value: 0x0000_F95B)

| Offset: 0x02A4 | | | Register Name: AC_ADC_DRC_MNGHS |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15:0 | R/W | 0xF95B | ADC_DRC_MNGHS The min gain setting, which is determined by equation $MXG_{in}=MXG/6.0206$. The format is 8.24 and must $-60\text{ dB} \leq MNG \leq -40\text{ dB}$ (The default value is -40 dB) |

8.4.6.107 0x02A8 ADC DRC MIN Gain Low Setting Register (Default Value: 0x0000_2C3F)

| Offset: 0x02A8 | | | Register Name: AC_ADC_DRC_MNGLS |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15:0 | R/W | 0x2C3F | ADC_DRC_MNGLS The min gain setting, which is determined by equation $MXG_{in}=MNG/6.0206$. The format is 8.24 and must $-60\text{ dB} \leq MNG \leq -40\text{ dB}$ (The default value is -40 dB) |

8.4.6.108 0x02AC ADC DAP Expander Smooth Time High Coef Register (Default Value: 0x0000_0000)

| Offset: 0x02AC | | | Register Name: AC_ADC_DRC_EPSHC |
|----------------|------------|-------------|---------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:11 | / | / | / |

| Offset: 0x02AC | | | Register Name: AC_ADC_DRC_EPSHC |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 10:0 | R/W | 0x0000 | ADC_DRC_EPSHC The gain smooth filter release and attack time parameter setting in expander region, which is determined by the equation that $RT = 1 - \exp(-2.2Ts/tr)$. The format is 3.24. (The default value is 30 ms) |

8.4.6.109 0x02B0 ADC DRC Expander Smooth Time Low Coef Register (Default Value: 0x0000_640C)

| Offset: 0x02B0 | | | Register Name: AC_ADC_DRC_EPSLC |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15:0 | R/W | 0x640C | ADC_DRC_EPSLC The gain smooth filter release and attack time parameter setting in expander region, which is determined by the equation that $RT = 1 - \exp(-2.2Ts/tr)$. The format is 3.24. (The default value is 30 ms) |

8.4.6.110 0x02B8 ADC DRC HPF Gain High Coef Register (Default Value: 0x0000_0100)

| Offset: 0x02B8 | | | Register Name: AC_ADC_DRC_HPFHGAIN |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:11 | / | / | / |
| 10:0 | R/W | 0x100 | ADC_DRC_HPFHGAIN The gain of HPF coefficient setting, which format is 3.24. (gain = 1) |

8.4.6.111 0x02BC ADC DRC HPF Gain Low Coef Register (Default Value: 0x0000_0000)

| Offset: 0x02BC | | | Register Name: AC_ADC_DRC_HPFLGAIN |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15:0 | R/W | 0x0000 | ADC_DRC_HPFLGAIN The gain of HPF coefficient setting, which format is 3.24. (gain = 1) |

8.4.6.112 0x0300 ADC1 Analog Control Register (Default Value: 0x001C_C055)

9 Interfaces

9.1 TWI

9.1.1 Overview

The Two Wire Interface (TWI) provides an interface between a CPU and any TWI-bus-compatible device that connects via the TWI bus. The TWI is designed to be compatible with the standard I2C bus protocol. The communication of the TWI is carried out by a byte-wise mode based on interrupt polled handshaking. Each device on the TWI bus is recognized by a unique address and can operate as either transmitter or receiver, a device connected to the TWI bus can be considered as master or slave when performing data transfers. Note that a master device is a device that initiates a data transfer on the bus and generates the clock signals to permit the transfer. During this transfer, any device addressed by this master is considered a slave.

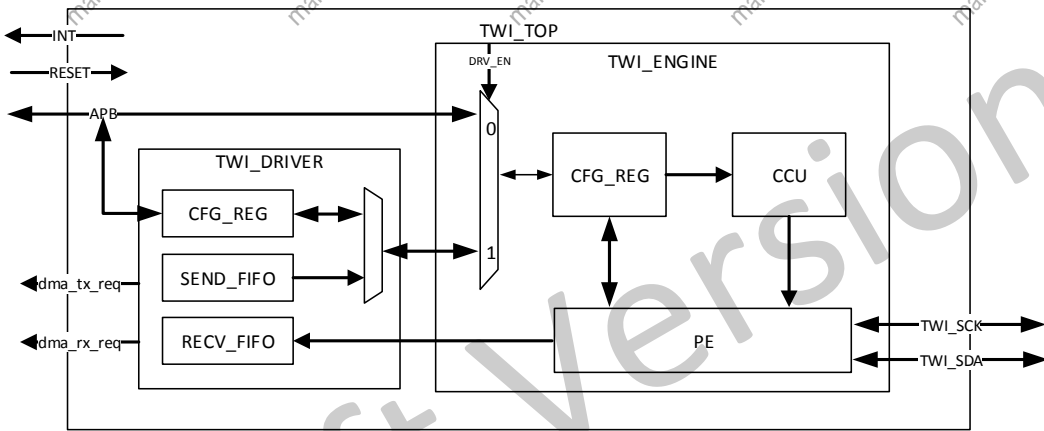

The TWI has the following features:

- Compliant with I2C bus standard
- Supports standard mode (up to 100 kbit/s) and fast mode (up to 400 kbit/s)
- Supports 7-bit and 10-bit device addressing modes
- Supports master mode or slave mode
- Master mode features:
 - Supports the bus arbitration in the case of multiple master devices
 - Supports clock synchronization and bit and byte waiting
 - Supports packet transmission and DMA
- Slave mode features:
 - Interrupt on address detection
- The TWI controller includes one TWI engine and one TWI driver. And the TWI driver supports packet transmission and DMA mode when TWI works in master mode

9.1.2 Block Diagram

Figure 9-1 shows the block diagram of TWI.

Figure 9-1 TWI Block Diagram

TWI contains the following sub-blocks:

Table 9-1 TWI Sub-blocks

| Sub-block | Description |
|-----------|---|
| RESET | Module reset signal |
| INT | Module output interrupt signal |
| CFG_REG | Module configuration register in TWI |
| PE | Packet encoding/decoding |
| CCU | Module clock controller unit |
| SEND_FIFO | The register address bytes and the written data bytes are buffered in SEND_FIFO |
| RECV_FIFO | The read data bytes are buffered in RECV_FIFO |

The controller includes TWI engine and TWI driver. Each time the TWI engine sends a START signal, a STOP signal, or a BYTE data, or a corresponding ACK, the TWI engine will generate an interrupt, and wait for the CPU to process and clear the interrupt before the next START, STOP, or BYTE, ACK transmission can be performed. Therefore, when a device communication is completed, many interrupts will be generated, and the CPU needs to wait for the previous interrupt before it can configure the next one. The TWI driver defines each communication with the device as a packet transmission. The CPU can directly configure the slave address, register address and data transmission for one or more package transmissions without waiting for interruption, then start the TWI driver, and the TWI driver can control the TWI engine to complete a pre-configured communication, and report an interrupt to the CPU after completion.

9.1.3 Functional Description

9.1.3.1 External Signals

The TWI controller has 4 TWI modules called TWI0, TWI1, TWI2, and TWI3. The following table describes the external signals of the TWI. The TWIn-SCK and TWIn-SDA are bidirectional I/O, when the TWI is configured as a master device, the TWIn-SCK is an output pin; when the TWI is configurable as a slave device, the TWIn-SCK is an input pin. When using TWI, the corresponding PADS are selected as TWI function via section 9.7 “GPIO”.

Table 9-2 TWI External Signals

| Signal | Description | Type |
|----------|-------------------|---------|
| TWI0-SCK | TWI0 Clock Signal | I/O, OD |
| TWI0-SDA | TWI0 Serial Data | I/O, OD |
| TWI1-SCK | TWI1 Clock Signal | I/O, OD |
| TWI1-SDA | TWI1 Serial Data | I/O, OD |
| TWI2-SCK | TWI2 Clock Signal | I/O, OD |
| TWI2-SDA | TWI2 Serial Data | I/O, OD |
| TWI3-SCK | TWI3 Clock Signal | I/O, OD |
| TWI3-SDA | TWI3 Serial Data | I/O, OD |

9.1.3.2 Clock Sources

Each TWI controller has an input clock source. The following table describes the clock sources for TWI. After selecting a proper clock, users must open the gating of TWI and release the corresponding reset bit.

For more details on the clock setting, configuration, and gating information, see section 3.2 “CCU”.

Table 9-3 TWI Clock Sources

| Clock Sources | Description |
|---------------|---|
| APB1 Bus | TWI clock source. Refer to CCU for details on APB1. |

9.1.3.3 Write/Read Timing in Standard and Extended Addressing Mode

This section is the 7-bit/10-bit addressing mode of the entire TWI protocol to read and write device registers. It can be achieved by directly using the TWI engine or using the TWI driver to control the TWI engine.

Figure 9-2 describes the write timing in 7-bit standard addressing mode.

Figure 9-2 Write Timing in 7-bit Standard Addressing Mode

Slave addr = 7-bit , register addr = 8-bit, data = 8-bit

Slave addr = 7-bit , register addr = 8-bit, data = n-byte

- from master to slave S: START condition A: acknowledge(SDA LOW)
- from slave to master P: STOP condition \bar{A} : not acknowledge(SDA HIGH)

Figure 9-3 describes the read timing in 7-bit standard address mode.

Figure 9-3 Read Timing in 7-bit Standard Addressing Mode

Slave addr = 7-bit , register addr = 8-bit, data = 8-bit

Slave addr = 7-bit , register addr = 8-bit, data = n-byte

- from master to slave S: START condition A: acknowledge(SDA LOW)
- from slave to master P: STOP condition \bar{A} : not acknowledge(SDA HIGH)
- from slave to master Sr: RE-START condition

Figure 9-4 describes the write timing in 10-bit extended address mode.

Figure 9-6 TWI Driver Write Packet Transmission

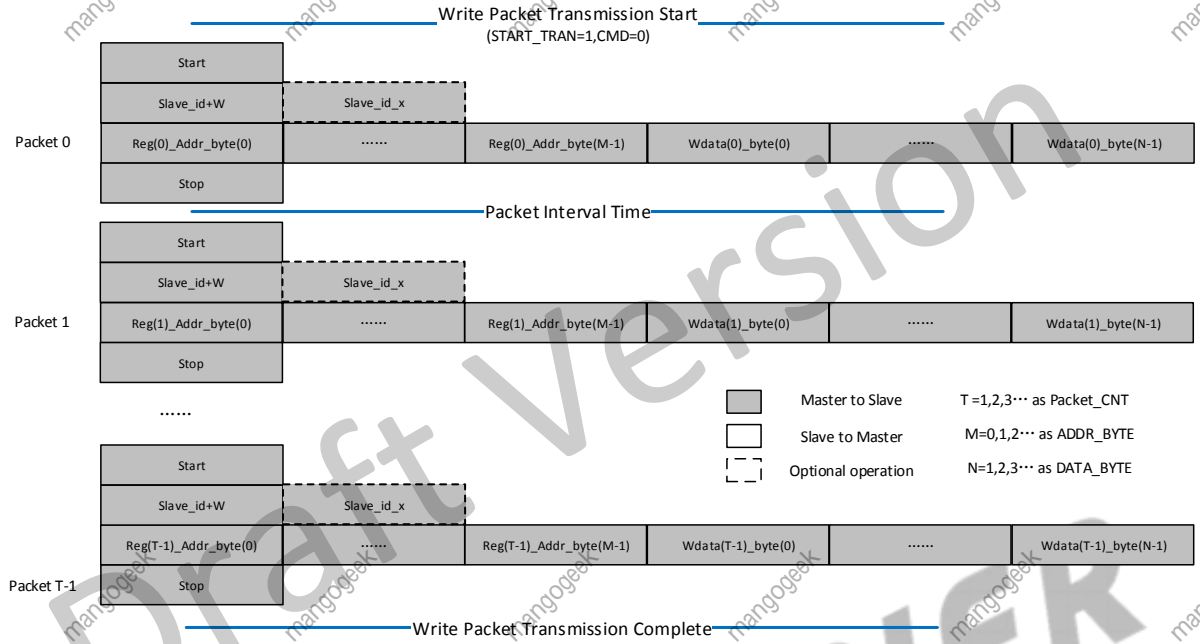

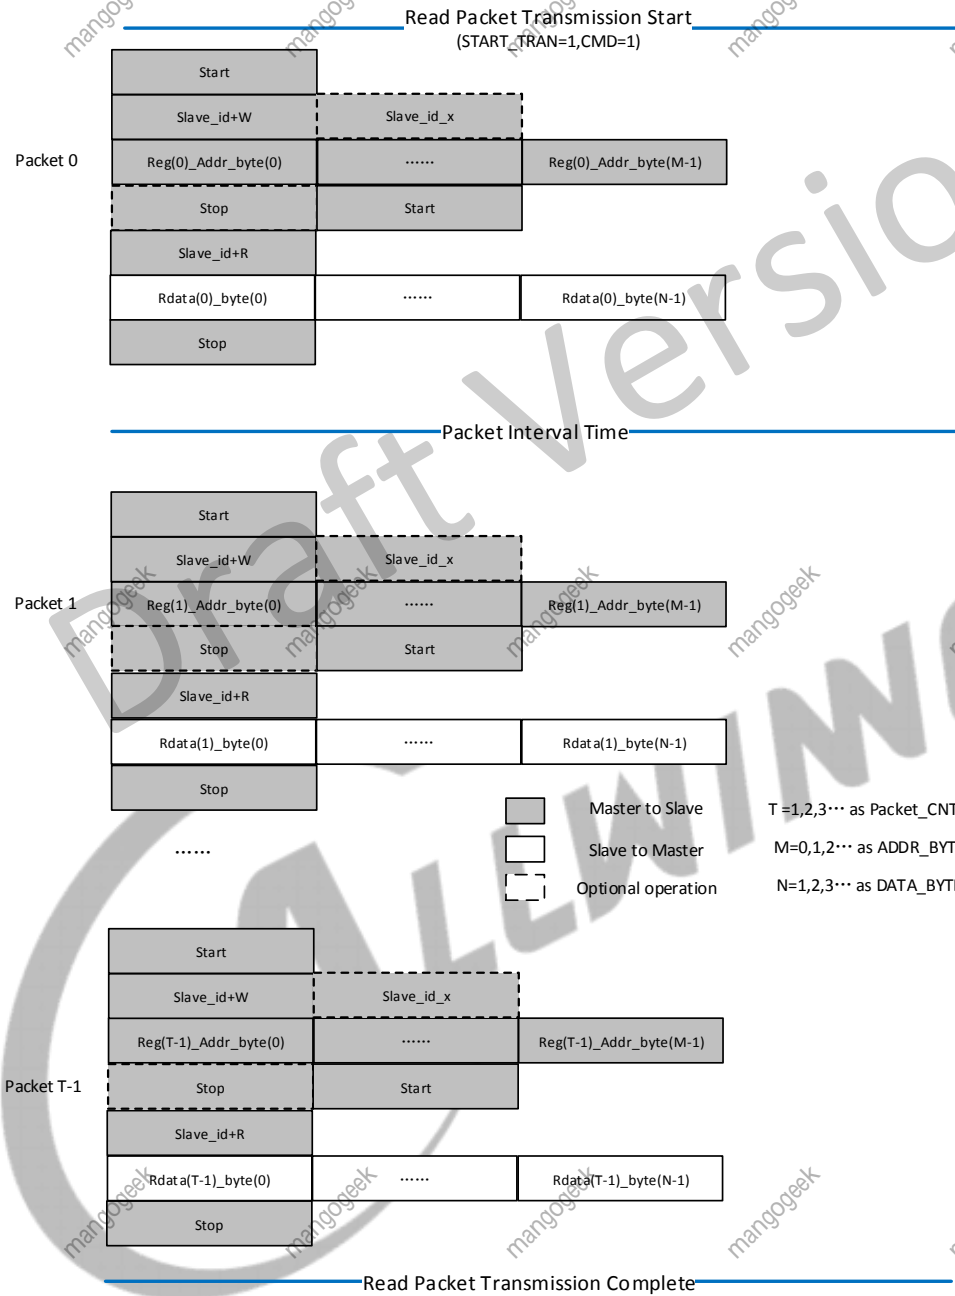

Figure 9-7 TWI Driver Read Packet Transmission

9.1.3.5 Master and Slave Mode of TWI Engine

In Master mode, the CPU host controls the TWI engine by writing command and data to its registers. The TWI engine transmits an interrupt to CPU when each time a byte transfer is done or a START/STOP command is detected. The CPU host can poll the status register if the interrupt mechanism is not disabled by the CPU host.

When the CPU host wants to start a bus transfer, it initiates a bus START to enter the master mode by setting **TWI_CNTR[M_STA]** to high. The TWI engine will assert the INT line and **TWI_CNTR[INT_FLAG]** to indicate a completion for the START command and each consequent byte transfer. At each interrupt, the CPU host needs

to check the current state by the [TWI_STAT](#) register. A transfer must conclude with the STOP command by setting [TWI_CNTR\[M_STP\]](#) to high.

In Slave mode, the TWI engine also constantly samples the bus and look for its own slave address during addressing cycles. Once a match is found, it is addressed, and the TWI engine interrupts the CPU host with the corresponding status. Upon request, the CPU host should read the status, read/write the [TWI_DATA](#) register, and set the [TWI_CNTR](#) register. After each byte transfer, a slave device always stops the operation of the remote master by holding the next low pulse on the SCL line until the CPU host responds to the status of the previous byte transfer or START command.

9.1.3.6 Generation of Repeated Start

After the data transfer, if the master still requires the bus, it can signal another Start followed by another slave address without signaling a Stop.

9.1.3.7 Programming State Diagram

Figure 9-8 shows the TWI programming state diagram. For the value between two states, see the [TWI_STAT](#) register in section 9.1.6.5.

M_SEND_S: master sends START signal;

M_SEND_ADDR: master sends slave address;

M_SEND_XADD: master sends slave extended address;

M_SEND_SR: master repeated start;

M_SEND_DATA: master sends data;

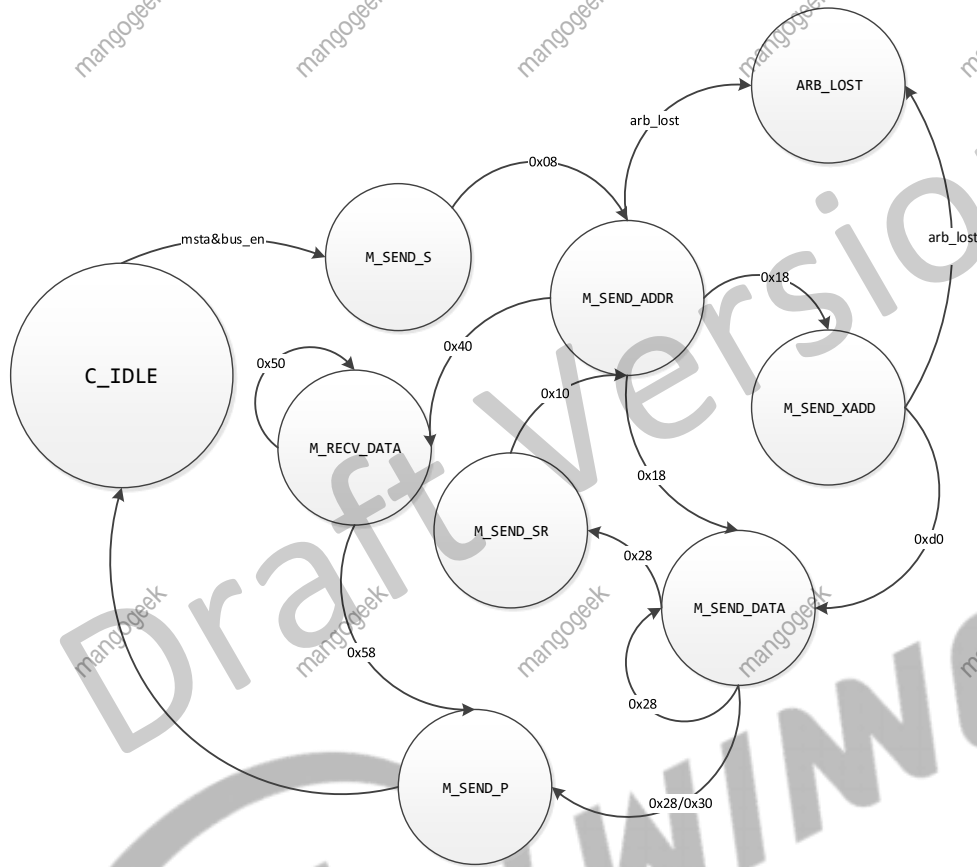

M_SEND_P: master sends STOP signal;

M_RECV_DATA: master receives data;

ARB_LOST: Arbitration lost;

C_IDLE: Idle.

Figure 9-8 TWI Programming State Diagram

9.1.4 Programming Guidelines

The TWI controller operates in an 8-bit data format. The data on the TWI_SDA line is always 8 bits long. At first, the TWI controller sends a start condition. When in the addressing formats of 7-bit, the TWI sends out an 8-bit message which includes 7 MSB slave address and 1 LSB read/write flag. The least significant of the slave address indicates the direction of transmission. When the TWI works in 10-bit slave address mode, the operation will be divided into two steps, for details on the operation, refer to register description in Section 9.1.6.1 and 9.1.6.2.

The following takes the TWI module in the CPUX domain as an example.

9.1.4.1 Initialization for TWI Engine

To initialize the TWI engine, perform the following steps:

- Step 1** Configure corresponding GPIO multiplex function as TWI mode.
- Step 2** For TWIn, set [TWI_BGR_REG\[TWIn_GATING\]](#) in CCU module to 0 to close TWIn clock.
- Step 3** For TWIn, set [TWI_BGR_REG\[TWIn_RST\]](#) in CCU module to 0, then set to 1 to reset TWIn.

- Step 4** For TWIn, set [TWI_BGR_REG](#)[TWIn_GATING] in CCU module to 1 to open TWIn clock.
- Step 5** Configure [TWI_CCR](#)[CLK_M] and [TWI_CCR](#)[CLK_N] to get the needed rate (The clock source of TWI is from APB1).
- Step 6** Configure [TWI_CNTR](#)[BUS_EN] and [TWI_CNTR](#)[A_ACK], when using interrupt mode, set [TWI_CNTR](#)[INT_EN] to 1, and register the system interrupt. In slave mode, configure [TWI_ADDR](#) and [TWI_XADDR](#) registers to finish TWI initialization configuration.

9.1.4.2 Writing Data Operation for TWI Engine

To write data to the device, perform the following steps:

- Step 1** Clear [TWI_EFR](#) register, and configure [TWI_CNTR](#)[M_STA] to 1 to transmit the START signal.
- Step 2** After the START signal is transmitted, the first interrupt is triggered, then write device ID to [TWI_DATA](#) (For a 10-bit device ID, firstly write the first byte ID, secondly write the second byte ID in the next interrupt).
- Step 3** The Interrupt is triggered again after device ID transmission completes, write device data address to be read to [TWI_DATA](#) (For a 16-bit address, firstly write the first-byte address, secondly write the second-byte address).
- Step 4** Interrupt is triggered after data address transmission completes, write data to be transmitted to [TWI_DATA](#) (For consecutive write data operation, every byte transmission completion triggers interrupt, during interrupt write the next byte data to [TWI_DATA](#)).
- Step 5** After transmission completes, write [TWI_CNTR](#)[M_STP] to 1 to transmit the STOP signal and end this write-operation.

9.1.4.3 Reading Data Operation for TWI Engine

To read data from the device, perform the following steps:

- Step 1** Clear [TWI_EFR](#) register, and set [TWI_CNTR](#)[A_ACK] to 1, and configure [TWI_CNTR](#)[M_STA] to 1 to transmit the START signal.
- Step 2** After the START signal is transmitted, the first interrupt is triggered, then write device ID to [TWI_DATA](#) (For a 10-bit device ID, firstly write the first-byte ID, secondly write the second-byte ID in the next interrupt).
- Step 3** The Interrupt is triggered again after device ID transmission completes, write device data address to be read to [TWI_DATA](#) (For a 16-bit address, firstly write the first-byte address, secondly write the second-byte address).

- Step 4** The Interrupt is triggered after data address transmission completes, write [TWI_CNTR\[M_STA\]](#) to 1 to transmit new START signal, and after interrupt triggers, write device ID to [TWI_DATA](#) to start read-operation.
- Step 5** After device address transmission completes, each receive completion will trigger an interrupt, in turn, read [TWI_DATA](#) to get data, when receiving the previous interrupt of the last byte data, clear [C:\Users\chenxiaofang\AppData\Roaming\Microsoft\Word\ Hlk50046436 - Hlk50051279\[A_ACK\]](#) to stop acknowledge signal of the last byte.
- Step 6** Write [TWI_CNTR\[M_STP\]](#) to 1 to transmit the STOP signal and end this read-operation.

9.1.4.4 Initialization for TWI Driver

To initialize the TWI driver, perform the following steps:

- Step 1** Configure corresponding GPIO multiplex function as TWI mode.
- Step 2** For TWIn, set [TWI_BGR_REG\[TWIn_GATING\]](#) in CCU module to 0 to close TWIn clock.
- Step 3** For TWIn, set [TWI_BGR_REG\[TWIn_RST\]](#) in CCU module to 0, then set to 1 to reset TWIn.
- Step 4** For TWIn, set [TWI_BGR_REG\[TWIn_GATING\]](#) in CCU module to 1 to open TWIn clock.
- Step 5** Set [TWI_DRV_CTRL\[TWI_DRV_EN\]](#) to 1 to enable the TWI driver.
- Step 6** Configure [TWI_DRV_BUS_CTRL\[CLK_M\]](#) and [TWI_DRV_BUS_CTRL\[CLK_N\]](#) to get the needed rate (The clock source of TWI is from APB1).
- Step 7** Set [TWI_DRV_CTRL\[RESTART_MODE\]](#) to 0 and [C:\Users\chenxiaofang\AppData\Roaming\Microsoft\Word\ Hlk50051373 - Hlk50051463\[READ_TRAN_MODE\]](#) to 1, set [TWI_DRV_INT_CTRL\[TRAN_COM_INT_EN\]](#) to 1.
- Step 8** When using DMA for data transmission, set [TWI_DRV_DMA_CFG\[DMA_RX_EN\]](#) and [TWI_DRV_DMA_CFG\[DMA_TX_EN\]](#) to 1, and configure [TWI_DRV_DMA_CFG\[RX_TRIG\]](#) and [TWI_DRV_DMA_CFG\[TX_TRIG\]](#) to set the thresholds of RXFIFO and TXFIFO.

9.1.4.5 Writing Packet Transmission for TWI Driver

To write package to the device, perform the following steps:

- Step 1** Configure [TWI_DRV_SLV\[SLV_ID\]](#) to set the device ID, and configure [TWI_DRV_SLV\[CMD\]](#) to 0 to set the write operation.
- Step 2** Configure [TWI_DRV_FMT\[ADDR_BYTE\]](#) according to the address width of the device register, and [TWI_DRV_FMT\[DATA_BYTE\]](#) according to the written data count in a packet.

- Step 3** Configure [TWI_DRV_CFG](#)[PACKET_CNT] to set the written packet number.
- Step 4** Configure DMA channel, including TWI TXFIFO, device register address, and the written data.
- Step 5** Set [C:\Users\chenxiaofang\AppData\Roaming\Microsoft\Word\ Hlk50051463 - Hlk50051932](#)[START_TRAN] to 1 to start TWI Driver transmission.
- Step 6** When TWI driver transmission completes, the interrupt is triggered, it indicates that the write packet transmission ends.

9.1.4.6 Reading Packet Transmission for TWI Driver

To read package from the device, perform the following steps:

- Step 1** Configure [TWI_DRV_SLV](#)[SLV_ID] to set the device ID, and configure [TWI_DRV_SLV](#)[CMD] to 1 to set the read operation.
- Step 2** Configure [TWI_DRV_FMT](#)[ADDR_BYTE] according to the address width of the device register, and [TWI_DRV_FMT](#)[DATA_BYTE] according to the read data count in a packet.
- Step 3** Configure [TWI_DRV_CFG](#)[PACKET_CNT] to set the read packet number.
- Step 4** Configure DMA channel, including TWI TXFIFO, TWI RXFIFO, device register address and the read data.
- Step 5** Set [C:\Users\chenxiaofang\AppData\Roaming\Microsoft\Word\ Hlk50051463 - Hlk50051932](#)[START_TRAN] to 1 to start TWI Driver transmission.
- Step 6** When TWI driver transmission completes, the interrupt is triggered, it indicates that the read packet transmission ends.

9.1.5 Register List

| Module Name | Base Address |
|-------------|--------------|
| TWI0 | 0x02502000 |
| TWI1 | 0x02502400 |
| TWI2 | 0x02502800 |
| TWI3 | 0x02502C00 |

| Register Name | Offset | Description |
|---------------|--------|-------------------------------------|
| TWI_ADDR | 0x0000 | TWI Slave Address Register |
| TWI_XADDR | 0x0004 | TWI Extended Slave Address Register |
| TWI_DATA | 0x0008 | TWI Data Byte Register |

| Register Name | Offset | Description |
|-----------------------|--------|---|
| TWI_CNTR | 0x000C | TWI Control Register |
| TWI_STAT | 0x0010 | TWI Status Register |
| TWI_CCR | 0x0014 | TWI Clock Control Register |
| TWI_SRST | 0x0018 | TWI Software Reset Register |
| TWI_EFR | 0x001C | TWI Enhance Feature Register |
| TWI_LCR | 0x0020 | TWI Line Control Register |
| TWI_DRV_CTRL | 0x0200 | TWI_DRV Control Register |
| TWI_DRV_CFG | 0x0204 | TWI_DRV Transmission Configuration Register |
| TWI_DRV_SLV | 0x0208 | TWI_DRV Slave ID Register |
| TWI_DRV_FMT | 0x020C | TWI_DRV Packet Format Register |
| TWI_DRV_BUS_CTRL | 0x0210 | TWI_DRV Bus Control Register |
| TWI_DRV_INT_CTRL | 0x0214 | TWI_DRV Interrupt Control Register |
| TWI_DRV_DMA_CFG | 0x0218 | TWI_DRV DMA Configure Register |
| TWI_DRV_FIFO_CON | 0x021C | TWI_DRV FIFO Content Register |
| TWI_DRV_SEND_FIFO_ACC | 0x0300 | TWI_DRV Send Data FIFO Access Register |
| TWI_DRV_RECV_FIFO_ACC | 0x0304 | TWI_DRV Receive Data FIFO Access Register |

9.1.6 Register Description

9.1.6.1 0x0000 TWI Slave Address Register (Default Value: 0x0000_0000)

| Offset: 0x0000 | | | Register Name: TWI_ADDR |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:8 | / | / | / |
| 7:1 | R/W | 0x0 | SLA Slave Address For 7-bit addressing, the bit[7:1] indicates: SLA6, SLA5, SLA4, SLA3, SLA2, SLA1, SLA0 For 10-bit addressing, the bit[7:1] indicates: 1, 1, 1, 1, 0, SLAX[9:8] |
| 0 | R/W | 0x0 | GCE General Call Address Enable 0: Disable 1: Enable |

 **NOTE**

For 7-bit addressing:

SLA6 – SLA0 is the 7-bit address of the TWI in slave mode. When the TWI receives this address after a START condition, it will generate an interrupt and enter slave mode. (SLA6 corresponds to the first bit received from the TWI bus.) If GCE is set to ‘1’, the TWI will also recognize the general call address (00h).

For 10-bit addressing:

When the address received starts with b’11110, the TWI recognizes b’11110 as the first part of a 10-bit address and if the next two bits match ADDR[2:1] (For example, SLAX9 and SLAX8 for the extended address of the device), it sends an ACK. (The device does not generate an interrupt at this point.) If the next byte of the address matches the XADDR register (SLAX7 – SLAX0), the TWI generates an interrupt and goes into slave mode.

9.1.6.2 0x0004 TWI Extend Address Register (Default Value: 0x0000_0000)

| Offset: 0x0004 | | | Register Name: TWI_XADDR |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:8 | / | / | / |
| 7:0 | R/W | 0x0 | SLAX Extend Slave Address SLAX[7:0] |

9.1.6.3 0x0008 TWI Data Register (Default Value: 0x0000_0000)

| Offset: 0x0008 | | | Register Name: TWI_DATA |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:8 | / | / | / |
| 7:0 | R/W | 0x0 | TWI_DATA Data byte transmitted or received |

9.1.6.4 0x000C TWI Control Register (Default Value: 0x0000_0000)

| Offset: 0x000C | | | Register Name: TWI_CNTR |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:8 | / | / | / |
| 7 | R/W | 0x0 | <p>INT_EN Interrupt Enable</p> <p>0: The interrupt line always low 1: The interrupt line will go high when INT_FLAG is set.</p> |
| 6 | R/W | 0x0 | <p>BUS_EN TWI Bus Enable</p> <p>0: The TWI bus SDA/SCL is ignored and the TWI controller will not respond to any address on the bus. 1: The TWI will respond to call to its slave address – and to the general call address if the GCE bit in the ADDR register is set.</p> <p>Note: In master operation mode, this bit should be set to '1'.</p> |
| 5 | R/WAC | 0x0 | <p>M_STA Master Mode Start</p> <p>When the M_STA is set to '1', the TWI controller enters master mode and will transmit a START condition on the bus when the bus is free. If the M_STA bit is set to '1' when the TWI controller is already in master mode and one or more bytes have been transmitted, then a repeated START condition will be sent. If the M_STA bit is set to '1' when the TWI is accessed in slave mode, the TWI will complete the data transfer in slave mode then enter master mode when the bus has been released.</p> <p>The M_STA bit is cleared automatically after a START condition has been sent. Writing a '0' to this bit has no effect.</p> |
| 4 | R/W1C | 0x0 | <p>M_STP Master Mode Stop</p> <p>If the M_STP is set to '1' in master mode, a STOP condition is transmitted on the TWI bus. If the M_STP bit is set to '1' in slave mode, the TWI will indicate if a STOP condition has been received, but no STOP condition will be transmitted on the TWI bus. If both M_STA and M_STP bits are set, the TWI will first transmit the STOP condition (if in master mode), then transmit the START condition.</p> <p>The M_STP bit is cleared automatically. Writing a '0' to this bit has no effect.</p> |

| Offset: 0x000C | | | Register Name: TWI_CNTR |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 3 | R/W1C | 0x0 | <p>INT_FLAG Interrupt Flag</p> <p>The INT_FLAG is automatically set to '1' when any of the 28 (out of the possible 29) states is entered (see 'STAT Register' below). The state that does not set INT_FLAG is state F8h. If the INT_EN bit is set, the interrupt line goes high when INT_FLAG is set to '1'. If the TWI is operating in slave mode, the data transfer is suspended when INT_FLAG is set and the low period of the TWI bus clock line (SCL) is stretched until '1' is written to INT_FLAG. The TWI clock line is then released and the interrupt line goes low.</p> |
| 2 | R/W | 0x0 | <p>A_ACK Assert Acknowledge</p> <p>When A_ACK is set to '1', an Acknowledge (low level on SDA) will be sent during the acknowledge clock pulse on the TWI bus if:</p> <ol style="list-style-type: none"> (1). Either the whole of a matching 7-bit slave address or the first or the second byte of a matching 10-bit slave address has been received. (2). The general call address has been received and the GCE bit in the ADDR register is set to '1'. (3). A data byte has been received in master or slave mode. <p>When A_ACK is '0', a Not Acknowledge (high level on SDA) will be sent when a data byte is received in master or slave mode.</p> <p>If A_ACK is cleared to '0' in slave transmitter mode, the byte in the DATA register is assumed to be the 'last byte'. After this byte has been transmitted, the TWI will enter state C8h then return to the idle state (status code F8h) when INT_FLAG is cleared.</p> <p>The TWI will not respond as a slave unless A_ACK is set.</p> |
| 1 | / | / | / |
| 0 | R/W | 0x0 | <p>CLK_COUNT_MODE</p> <p>0: scl clock high period count on oscl 1: scl clock high period count on iscl</p> |

9.1.6.5 0x0010 TWI Status Register (Default Value: 0x0000_00F8)

| Offset: 0x0010 | | | Register Name: TWI_STAT |
|----------------|------------|-------------|-------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:8 | / | / | / |

| Offset: 0x0010 | | | Register Name: TWI_STAT |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 7:0 | R | 0xF8 | <p>STA</p> <p>Status Information Byte</p> <p>Code Status</p> <p>0x00: Bus error</p> <p>0x08: START condition transmitted</p> <p>0x10: Repeated START condition transmitted</p> <p>0x18: Address + Write bit transmitted, ACK received</p> <p>0x20: Address + Write bit transmitted, ACK not received</p> <p>0x28: Data byte transmitted in master mode, ACK received</p> <p>0x30: Data byte transmitted in master mode, ACK not received</p> <p>0x38: Arbitration lost in address or data byte</p> <p>0x40: Address + Read bit transmitted, ACK received</p> <p>0x48: Address + Read bit transmitted, ACK not received</p> <p>0x50: Data byte received in master mode, ACK transmitted</p> <p>0x58: Data byte received in master mode, not ACK transmitted</p> <p>0x60: Slave address + Write bit received, ACK transmitted</p> <p>0x68: Arbitration lost in the address as master, slave address + Write bit received, ACK transmitted</p> <p>0x70: General Call address received, ACK transmitted</p> <p>0x78: Arbitration lost in the address as master, General Call address received, ACK transmitted</p> <p>0x80: Data byte received after slave address received, ACK transmitted</p> <p>0x88: Data byte received after slave address received, not ACK transmitted</p> <p>0x90: Data byte received after General Call received, ACK transmitted</p> <p>0x98: Data byte received after General Call received, not ACK transmitted</p> <p>0xA0: STOP or repeated START condition received in slave mode</p> <p>0xA8: Slave address + Read bit received, ACK transmitted</p> <p>0xB0: Arbitration lost in the address as master, slave address + Read bit received, ACK transmitted</p> <p>0xB8: Data byte transmitted in slave mode, ACK received</p> <p>0xC0: Data byte transmitted in slave mode, ACK not received</p> <p>0xC8: The Last byte transmitted in slave mode, ACK received</p> <p>0xD0: Second Address byte + Write bit transmitted, ACK received</p> |

| Offset: 0x0010 | | | Register Name: TWI_STAT |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| | | | 0xD8: Second Address byte + Write bit transmitted, ACK not received 0xF8: No relevant status information, INT_FLAG=0 Others: Reserved |

9.1.6.6 0x0014 TWI Clock Register (Default Value: 0x0000_0080)

| Offset: 0x0014 | | | Register Name: TWI_CCR |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:8 | / | / | / |
| 7 | R/W | 0x1 | CLK_DUTY Setting duty cycle of clock as master 0: 50% 1: 40% |
| 6:3 | R/W | 0x0 | CLK_M The TWI SCL output frequency, in master mode, is F1/10: $F1 = F0 / (CLK_M + 1)$ $Fscl = F1 / 10 = Fin / (2^{CLK_N} * (CLK_M + 1) * 10)$ Specially, $Fscl = F1 / 11$ when $CLK_M=0$ and $CLK_DUTY=40\%$ due to the delay of SCL sample debounce. |
| 2:0 | R/W | 0x0 | CLK_N The TWI bus is sampled by the TWI at the frequency defined by F0: $Fsamp = F0 = Fin / 2^{CLK_N}$ The TWI SCL output frequency, in master mode, is F1/10: $F1 = F0 / (CLK_M + 1)$ $Fscl = F1 / 10 = Fin / (2^{CLK_N} * (CLK_M + 1) * 10)$ Specially, $Fscl = F1 / 11$ when $CLK_M=0$ and $CLK_DUTY=40\%$ due to the delay of SCL sample debounce. For Example: Fin = 24 MHz (APB clock input) For 400 kHz full speed 2-wire, $CLK_N = 1$, $CLK_M = 2$ $F0 = 24\text{ MHz} / 2^1 = 12\text{ MHz}$, $F1 = F0 / (10 * (2+1)) = 0.4\text{ MHz}$ For 100 kHz standard speed 2-wire, $CLK_N = 1$, $CLK_M = 11$ $F0 = 24\text{ MHz} / 2^1 = 12\text{ MHz}$, $F1 = F0 / (10 * (11+1)) = 0.1\text{ MHz}$ |

9.1.6.7 0x0018 TWI Soft Reset Register (Default Value: 0x0000_0000)

| Offset: 0x0018 | | | Register Name: TWI_SRST |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:1 | / | / | / |
| 0 | R/WAC | 0x0 | SOFT_RST Soft Reset Write '1' to this bit to reset the TWI and clear to '0' when completing Soft Reset operation. |

9.1.6.8 0x001C TWI Enhance Feature Register (Default Value: 0x0000_0000)

| Offset: 0x001C | | | Register Name: TWI_EFR |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:2 | / | / | / |
| 1:0 | R/W | 0x0 | DBN Data Byte Number Follow Read Command Control 00: No data byte can be written after the read command 01: Only 1-byte data can be written after the read command 10: 2-bytes data can be written after the read command 11: 3-bytes data can be written after the read command |

9.1.6.9 0x0020 TWI Line Control Register (Default Value: 0x0000_003A)

| Offset: 0x0020 | | | Register Name: TWI_LCR |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:6 | / | / | / |
| 5 | R | 0x1 | SCL_STATE Current State of TWI_SCL 0: Low 1: High |
| 4 | R | 0x1 | SDA_STATE Current State of TWI_SDA 0: Low 1: High |

| Offset: 0x0020 | | | Register Name: TWI_LCR |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 3 | R/W | 0x1 | <p>SCL_CTL TWI_SCL Line State Control Bit</p> <p>When the line control mode is enabled (bit[2] is set), this bit decides the output level of TWI_SCL.</p> <p>0: Output low level 1: Output high level</p> |
| 2 | R/W | 0x0 | <p>SCL_CTL_EN TWI_SCL Line State Control Enable</p> <p>When this bit is set, the state of TWI_SCL is controlled by the value of bit[3].</p> <p>0: Disable TWI_SCL line control mode 1: Enable TWI_SCL line control mode</p> |
| 1 | R/W | 0x1 | <p>SDA_CTL TWI_SDA Line State Control Bit</p> <p>When the line control mode is enabled (bit[0] is set), this bit decides the output level of TWI_SDA.</p> <p>0: Output low level 1: Output high level</p> |
| 0 | R/W | 0x0 | <p>SDA_CTL_EN TWI_SDA Line State Control Enable</p> <p>When this bit is set, the state of TWI_SDA is controlled by the value of bit[1].</p> <p>0: Disable TWI_SDA line control mode 1: Enable TWI_SDA line control mode</p> |

9.1.6.10 0x0200 TWI_DRV Control Register (Default Value: 0x00F8_1000)

| Offset: 0x0200 | | | Register Name: TWI_DRV_CTRL |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R/WAC | 0x0 | <p>START_TRAN</p> <p>Start transmission</p> <p>0: Transmission idle</p> <p>1: Start transmission</p> <p>Automatically cleared to '0' when finished. If the slave is not responding for the expected status over the time defined by TIMEOUT, the current transmission will stop. All setting formats and data will be loaded from registers and FIFO when the transmission starts.</p> |

| 1 | R/W | 0x0 | SCL_MOE SCL manual output enable |
| 0 | R/W | 0x0 | SDA_MOE SDA manual output enable |

9.1.6.15 0x0214 TWI_DRV Interrupt Control Register (Default Value: 0x0000_0000)

| Offset: 0x0214 | | | Register Name: TWI_DRV_INT_CTRL |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:18 | / | / | / |
| 19 | R/W | 0x0 | RX_REQ_INT_EN If set, an interrupt is sent when RX_REQ_PD sets. |
| 18 | R/W | 0x0 | TX_REQ_INT_EN If set, an interrupt is sent when TX_REQ_PD sets. |
| 17 | R/W | 0x0 | TRAN_ERR_INT_EN If set, an interrupt is sent when TRAN_ERR_PD sets. |
| 16 | R/W | 0x0 | TRAN_COM_INT_EN If set, an interrupt is sent when TRAN_COM_PD sets. |
| 15:4 | / | / | / |
| 3 | R/W1C | 0x0 | RX_REQ_PD Set when the data byte number in RECV_FIFO reaches RX_TRIG. |
| 2 | R/W1C | 0x0 | TX_REQ_PD Set when there is no less than DMA_TX_TRIG empty byte number in SEND_FIFO. |
| 1 | R/W1C | 0x0 | TRAN_ERR_PD Packet transmission failure pending |
| 0 | R/W1C | 0x0 | TRAN_COM_PD Packet transmission completion pending |

9.1.6.16 0x0218 TWI_DRV DMA Configure Register (Default Value: 0x0010_0010)

| Offset: 0x0218 | | | Register Name: TWI_DRV_DMA_CFG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:25 | / | / | / |
| 24 | R/W | 0x0 | DMA_RX_EN DMA RX Enable |
| 23:22 | / | / | / |
| 21:16 | R/W | 0x10 | RX_TRIG RX trigger When DMA_RX_EN is set, send DMA RX Req when the data byte number in RECV_FIFO reaches RX_TRIG, or the read transmission is completed, the data of RECV_FIFO does not reach RX_TRIG but as long as the RECV_FIFO is not empty. |
| 15:9 | / | / | / |
| 8 | R/W | 0x0 | DMA_TX_EN DMA TX Enable |
| 7:6 | / | / | / |
| 5:0 | R/W | 0x10 | TX_TRIG TX trigger When DMA_TX_EN is set, send DMA TX Req when the space of SEND_FIFO (FIFO Level – data volume) reaches TX_TRIG. |

9.1.6.17 0x021C TWI_DRV FIFO Content Register (Default Value: 0x0000_0000)

| Offset: 0x021C | | | Register Name: TWI_DRV_FIFO_CON |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:23 | / | / | / |
| 22 | R/WAC | 0x0 | RECV_FIFO_CLEAR Set this bit to clear RECV_FIFO pointer, and this bit is cleared automatically. |
| 21:16 | R | 0x0 | RECV_FIFO_CONTENT The number of data in RECV_FIFO |
| 15:7 | / | / | / |
| 6 | R/WAC | 0x0 | SEND_FIFO_CLEAR Set this bit to clear SEND_FIFO pointer, and this bit is cleared automatically. |

| Offset: 0x021C | | | Register Name: TWI_DRV_FIFO_CON |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 5:0 | R | 0x0 | SEND_FIFO_CONTENT The number of data in SEND_FIFO |

9.1.6.18 0x0300 TWI_DRV Send Data FIFO Access Register (Default Value: 0x0000_0000)

| Offset: 0x0300 | | | Register Name: TWI_DRV_SEND_FIFO_ACC |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:8 | / | / | / |
| 7:0 | W | 0x0 | SEND_DATA_FIFO Address of a 32x8 SEND_FIFO, which stores reg address and data sending to the slave device. |

9.1.6.19 0x0304 TWI_DRV Receive Data FIFO Access Register (Default Value: 0x0000_0000)

| Offset: 0x0304 | | | Register Name: TWI_DRV_RECV_FIFO_ACC |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:8 | / | / | / |
| 7:0 | R | 0x0 | RECV_DATA_FIFO Address of a 32x8 RECV_FIFO, which stores data received from the slave device. |

9.2 UART

9.2.1 Overview

The universal asynchronous receiver transmitter (UART) provides an asynchronous serial communication with external devices, modem (data carrier equipment, DCE). It performs serial-to-parallel conversion on the data received from peripherals and transmits the converted data to the internal bus. It also performs parallel-to-serial conversion on the data that is transmitted to peripherals.

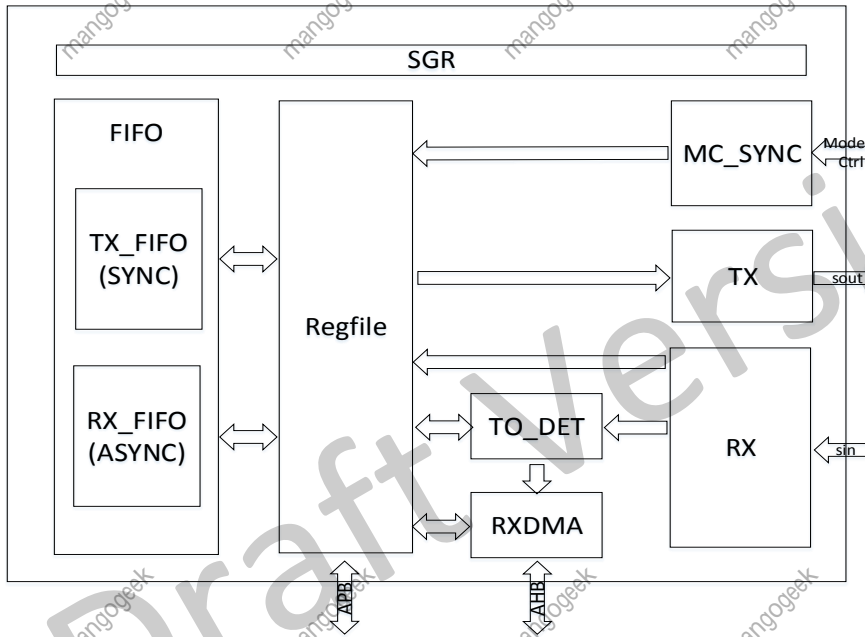

The UART has the following features:

- Compatible with industry-standard 16450/16550 UARTs
- Supports IrDA-compatible slow infrared (SIR) format
- Two separate FIFOs: one is RX FIFO, and the other is TX FIFO
 - Each of them is 64 bytes (For UART0)
 - Each of them is 256 bytes (For UART1, UART2, UART3, UART4, and UART5)
- The working reference clock is from the APB bus clock
 - Speed up to 4 Mbit/s with 64 MHz APB clock
 - Speed up to 1.5 Mbit/s with 24 MHz APB clock
- 5 to 8 data bits for RS-232 characters, or 9 bits RS-485 format
- 1, 1.5 or 2 stop bits
- Programmable parity (even, odd, or no parity)
- Supports TX/RX DMA slave controller interface
- Supports software/hardware flow control
- Supports RX DMA Master interface (Only for UART1)
- Supports auto-flow by using CTS & RTS (Only for UART1/2/3)

9.2.2 Block Diagram

Figure 9-9 shows a block diagram of the UART.

Figure 9-9 UART Block Diagram

9.2.3 Functional Description

9.2.3.1 External Signals

The following table describes the external signals of UART.

Table 9-4 UART External Signals

| Signal | Description | Type |
|-----------|----------------------------|------|
| UART0-TX | UART0 Data Transmit | O |
| UART0-RX | UART0 Data Receive | I |
| UART1-TX | UART1 Data Transmit | O |
| UART1-RX | UART1 Data Receive | I |
| UART1-CTS | UART1 Data Clear to Send | I |
| UART1-RTS | UART1 Data Request to Send | O |
| UART2-TX | UART2 Data Transmit | O |
| UART2-RX | UART2 Data Receive | I |
| UART2-CTS | UART2 Data Clear to Send | I |
| UART2-RTS | UART2 Data Request to Send | O |
| UART3-TX | UART3 Data Transmit | O |
| UART3-RX | UART3 Data Receive | I |

| Signal | Description | Type |
|-----------|----------------------------|------|
| UART3-CTS | UART3 Data Clear to Send | I |
| UART3-RTS | UART3 Data Request to Send | O |
| UART4-TX | UART4 Data Transmit | O |
| UART4-RX | UART4 Data Receive | I |
| UART5-TX | UART5 Data Transmit | O |
| UART5-RX | UART5 Data Receive | I |

9.2.3.2 Clock Sources

The following table describes the clock sources of UART.

Table 9-5 UART Clock Sources

| Clock Sources | Description |
|---------------|--|
| APB1 Bus | UART clock source. Refer to CCU for details on APB1. |

9.2.3.3 Typical Applications and Timing Diagram

UART Serial Data Format

The following figure shows the UART serial data format. The start bit, data bit, parity bit, and stop bit can be configured.

Figure 9-10 UART Serial Data Format

Using UART for RTS/CTS Autoflow Control

Figure 9-11 shows the typical application diagram for RTS/CTS autoflow control. Figure 9-12 shows the data format of the RTS/CTS autoflow control.

Figure 9-16 RS-485 Data Format

9.2.3.4 UART Operating Mode

Data Frame Format

The [UART LCR](#) register can set the basic parameter of a data frame: data width (5 to 8 bits), stop bit number (1/1.5/2), parity type.

A frame transfer of the UART includes the start signal, data signal, parity bit, and stop signal. The LSB is transmitted first.

- Start signal (start bit): It is the start flag of a data frame. According to the UART protocol, the low level of the TXD signal indicates the start of a data frame. When the UART transmits data, the level needs to hold high.
- Data signal (data bit): The data bit width can be configured as 5-bit, 6-bit, 7-bit, and 8-bit through different applications.

- Parity bit: It is a 1-bit error correction signal. Parity bit includes odd parity, even parity. The UART can enable and disable the parity bit by setting the [UART LCR](#) register.
- Stop Signal (stop bit): It is the stop bit of a data frame. The stop bit can be set to 1-bit, 1.5-bit, and 2-bit by the [UART LCR](#) register. The high level of the TXD signal indicates the end of a data frame.

Baud and Error Rates

The baud rate is calculated as follows: Baud rate = SCLK/(16 * divisor).

The SCLK is usually APB1 and can be set in section 3.2 “[CCU](#)”.

The divisor is frequency divider of UART. The frequency divider has 16-bit, the low 8-bit is in the [UART DLL](#) register, the high 8-bit is in the [UART DLH](#) register.

The relationship between the different UART mode and the error rate is as follows.

Figure 9-17 UART Mode Baud and Error Rates

| Clock source | Divisor | Baud rate | Over sampling | Error (%) |
|--------------|---------|-----------|---------------|-----------|
| 24000000 | 5000 | 300 | 16 | 0 |
| 24000000 | 2500 | 600 | 16 | 0 |
| 24000000 | 1250 | 1200 | 16 | 0 |
| 24000000 | 625 | 2400 | 16 | 0 |
| 24000000 | 313 | 4800 | 16 | -0.16 |
| 24000000 | 156 | 9600 | 16 | 0.16 |
| 24000000 | 78 | 19200 | 16 | 0.16 |
| 24000000 | 39 | 38400 | 16 | 0.16 |
| 24000000 | 26 | 57600 | 16 | 0.16 |
| 24000000 | 13 | 115200 | 16 | 0.16 |
| 48000000 | 13 | 230400 | 16 | 0.16 |

| 24000000 | 13 | 115200 | 16 | 0.16 |

DLAB Definition

The DLAB control bit ([UART_LCR\[7\]](#)) is the access control bit of the divisor Latch register.

If DLAB is 0, then the 0x00 offset address is the [UART_RBR/UART_THR](#) (RX/TX FIFO) register, and the 0x04 offset address is the [UART_IER](#) register.

If DLAB is 1, then the 0x00 offset address is the [UART_DLL](#) register, and the 0x04 offset address is the [UART_DLH](#) register.

When the UART initials, the divisor needs to be set. That is, writing 1 to DLAB can access the [UART_DLL](#) and [UART_DLH](#) register, after finished the configuration, writing 0 to DLAB can access the [UART_RBR/UART_THR](#) register.

CHCFG_AT_BUSY Definition

The function of the CHCFG_AT_BUSY ([UART_HALT\[1\]](#)) and CHANGE_UPDATE ([UART_HALT\[2\]](#)) are as follows.

CHCFG_AT_BUSY: Enable the bit, the software can also set the UART controller when UART is busy, such as the [UART_LCR](#), [UART_DLH](#), [UART_DLL](#) register.

CHANGE_UPDATE: If CHCFG_AT_BUSY is enabled, and CHANGE_UPDATE is written to 1, the configuration of the UART controller can be updated. After completed the update, the bit is cleared to 0 automatically.

Setting divisor performs the following steps:

- Step 1** Write 1 to CHCFG_AT_BUSY to enable “configure at busy”.
- Step 2** Write 1 to DLAB ([UART_LCR\[7\]](#)) and set the [UART_DLH](#) and [UART_DLL](#) registers.
- Step 3** Write 1 to CHANGE_UPDATE to update the configuration. The bit is cleared to 0 automatically after completing the update.

UART Busy Flag

The [UART_USR\[0\]](#) is a busy flag of the UART controller.

When the TX transmits data, or the RX receives data, or the TX FIFO is not empty, or the RX FIFO is not empty, then the busy flag bit can be set to 1 by hardware, which indicates the UART controller is busy.

9.2.4 Programming Guidelines

The following takes the UART module in the CPUX domain as an example.

9.2.4.1 Initialization

Step 1 System Initialization

- Configure [APB1_CFG_REG](#) in the CCU module to set the APB1 bus clock (The clock is 24MHz by default).
- Set [UART_BGR_REG\[UARTx_GATING\]](#) to 1 to enable the module clock, and set [UART_BGR_REG\[UARTx_RST\]](#) to 1 to de-assert the module.

Step 2 UART Controller Initialization

- IO configuration: Configure GPIO multiplex as UART function, and set UART pins to internal pull-up mode (For detail, see the description in section 9.7 “GPIO”).
- Baud-rate configuration:
 - Set UART baud-rate (refer to section 9.2.3.4);
 - Write [UART_FCR](#)[FIFOE] to 1 to enable TX/RX FIFO;
 - Write [UART_HALT](#)[HALT_TX] to 1 to disable TX transfer;
 - Set [UART_LCR](#)[DLAB] to 1, remain default configuration for other bits; set 0x00 offset address to the [UART_DLL](#) register, set 0x04 offset address to the [UART_DLH](#) register;
 - Write the high 8-bit of divisor to the [UART_DLH](#) register, and write the low 8-bit of divisor to the [UART_DLL](#) register;
 - Set [UART_LCR](#)[DLAB] to 0, remain default configuration for other bits; set 0x00 offset address to the [UART_RBR/UART_THR](#) register, set 0x04 offset address to the [UART_IER](#) register;
 - Set [UART_HALT](#)[HALT_TX] to 0 to enable TX transfer.

Step 3 Controller Parameter Configuration

- Set data width, stop bits, and even/odd parity type by writing the [UART_LCR](#) register.
- Reset, enable FIFO and set FIFO trigger condition by writing the [UART_FCR](#) register.
- Set the flow control parameter by writing the [UART_MCR](#) register.

Step 4 Interrupt Configuration

- Configure UART interrupt vector number to request UART interrupt (Refer to section 3.8 “PLIC” module for interrupt vector number).
- In DMA mode, write [UART_IER](#) to 0 to disable interrupt; write [UART_HSK](#)[Handshake configuration] to 0xE5 to set DMA handshake mode; write [UART_FCR](#)[DMAM] to 1 to set DMA transmission/reception mode; set DMA parameter and request DMA interrupt according to DMA configuration process.
- In Interrupt mode, configure [UART_IER](#) to enable the corresponding interrupt according to requirements: such as transmit (TX) interrupt, receive (RX) interrupt, receive line status interrupt, RS48 interrupt, etc. (Here TX/RX interrupt is usually used).

9.2.4.2 Transferring/Receiving Data in Query Mode

Data transfer

Step 1 Write data to [UART_THR](#) to start data transfer.

Step 2 Check TX_FIFO status by reading [UART_USR](#)[TFNF]. If the bit is 1, data can continue to be written; if the bit is 0, wait for data transfer, and data cannot continue to write until FIFO is not full.

Data receive

Step 1 Check RX_FIFO status by reading [UART_USR](#)[RFNE].

Step 2 Read data from [UART_RBR](#) if RX_FIFO is not empty.

Step 3 If [UART_USR](#)[RFNE] is 0, data is received completely.

9.2.4.3 Transferring/Receiving Data in Interrupt Mode

Data transfer

Step 1 Set [UART_IER](#)[ETBEI] to 1 to enable the *UART transmission interrupt*.

Step 2 Write the data to be transmitted to [UART_THR](#).

Step 3 When the data of TX_FIFO meets trigger condition (such as FIFO/2, FIFO/4), the UART transfer interrupt is generated.

Step 4 Check [UART_USR](#)[TFE] and determine whether TX_FIFO is empty. If [UART_USR](#)[TFE] is 1, it indicates that the data in TX_FIFO is transmitted completely.

Step 5 Clear [UART_IER](#)[ETBEI] to 0 to disable transfer interrupt.

Data receive

Step 1 Set [UART_IER](#)[ERBFI] to 1 to enable the *UART reception interrupt*.

Step 2 When the received data from RX_FIFO meets trigger condition (such as FIFO/2, FIFO/4), the UART receive interrupt is generated.

Step 3 Read data from [UART_RBR](#).

Step 4 Check RX_FIFO status by reading [UART_USR](#)[RFNE] and determine whether to read data. If the bit is 1, continue to read data from [UART_RBR](#) until [UART_USR](#)[RFNE] is cleared to 0, which indicates data is received completely.

9.2.4.4 Transferring/Receiving Data in DMA Mode

Data transfer

- Step 1** Configure the UART DMA interrupt according to the initialization process.
- Step 2** Configure DMA data channel, including the transfer source address, the transfer destination address, the number of data to be transferred, and the transfer type, and so on. (For details, see section 3.9 “DMAC”).
- Step 3** Enable the DMA transfer function of the UART by setting the register of the DMA module.
- Step 4** Determine whether UART data is transferred completely based on the DMA status. If all data is transferred completely, disable the DMA transfer function of the UART.

Data receive

- Step 1** Configure DMA data channel, including the transfer source address, the transfer destination address, the number of data to be transferred, and the transfer type, and so on. (For details, see section 3.9 “DMAC”).
- Step 2** Enable the DMA receive function of the UART by setting the register of the DMA module.
- Step 3** Determine whether UART data is received completely based on the DMA status. If all data is received completely, disable the DMA receive function of the UART.

9.2.5 Register List

| Module Name | Base Address |
|-------------|--------------|
| UART0 | 0x02500000 |
| UART1 | 0x02500400 |
| UART2 | 0x02500800 |
| UART3 | 0x02500C00 |
| UART4 | 0x02501000 |
| UART5 | 0x02501400 |

| Register Name | Offset | Description |
|---------------|--------|---------------------------------|
| UART_RBR | 0x0000 | UART Receive Buffer Register |
| UART_THR | 0x0000 | UART Transmit Holding Register |
| UART_DLL | 0x0000 | UART Divisor Latch Low Register |

| Register Name | Offset | Description |
|---------------------|--------|---|
| UART_DLH | 0x0004 | UART Divisor Latch High Register |
| UART_IER | 0x0004 | UART Interrupt Enable Register |
| UART_IIR | 0x0008 | UART Interrupt Identity Register |
| UART_FCR | 0x0008 | UART FIFO Control Register |
| UART_LCR | 0x000C | UART Line Control Register |
| UART_MCR | 0x0010 | UART Modem Control Register |
| UART_LSR | 0x0014 | UART Line Status Register |
| UART_MSR | 0x0018 | UART Modem Status Register |
| UART_SCH | 0x001C | UART Scratch Register |
| UART_USR | 0x007C | UART Status Register |
| UART_TFL | 0x0080 | UART Transmit FIFO Level Register |
| UART_RFL | 0x0084 | UART Receive FIFO Level Register |
| UART_HSK | 0x0088 | UART DMA Handshake Configuration Register |
| UART_DMA_REQ_EN | 0x008C | UART DMA Request Enable Register |
| UART_HALT | 0x00A4 | UART Halt TX Register |
| UART_DBG_DLL | 0x00B0 | UART Debug DLL Register |
| UART_DBG_DLH | 0x00B4 | UART Debug DLH Register |
| UART_A_FCC | 0x00F0 | UART FIFO Clock Control Register |
| UART_A_RXDMA_CTRL | 0x0100 | UART RXDMA Control Register |
| UART_A_RXDMA_STR | 0x0104 | UART RXDMA Start Register |
| UART_A_RXDMA_STA | 0x0108 | UART RXDMA Status Register |
| UART_A_RXDMA_LMT | 0x010C | UART RXDMA Limit Register |
| UART_A_RXDMA_SADDRL | 0x0110 | UART RXDMA Buffer Start Address Low Register |
| UART_A_RXDMA_SADDRH | 0x0114 | UART RXDMA Buffer Start Address High Register |
| UART_A_RXDMA_BL | 0x0118 | UART RXDMA Buffer Length Register |
| UART_A_RXDMA_IE | 0x0120 | UART RXDMA Interrupt Enable Register |
| UART_A_RXDMA_IS | 0x0124 | UART RXDMA Interrupt Status Register |
| UART_A_RXDMA_WADDRL | 0x0128 | UART RXDMA Write Address Low Register |
| UART_A_RXDMA_WADDRH | 0x012C | UART RXDMA Write Address high Register |
| UART_A_RXDMA_RADDRL | 0x0130 | UART RXDMA Read Address Low Register |
| UART_A_RXDMA_RADDRH | 0x0134 | UART RXDMA Read Address high Register |
| UART_A_RXDMA_DCNT | 0x0138 | UART RADMA Data Count Register |

9.2.6 Register Description

9.2.6.1 0x0000 UART Receiver Buffer Register (Default Value: 0x0000_0000)

| Offset: 0x0000 | | | Register Name: UART_RBR |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:8 | / | / | / |
| 7:0 | R | 0x0 | <p>RBR Receiver Buffer Register</p> <p>Data byte received on the serial input port (sin) in UART mode, or the serial infrared input (sir_in) in infrared mode. The data in this register is valid only if the Data Ready (DR) bit in UART_LCR is set.</p> <p>If in FIFO mode and FIFOs are enabled (The UART_FCR[0] is set to 1), this register accesses the head of the receive FIFO. If the receive FIFO is full and this register can not read before the next data character arrives, then the data already in the FIFO are preserved, but any incoming data are lost and an overrun error occurs.</p> |

9.2.6.2 0x0000 UART Transmit Holding Register (Default Value: 0x0000_0000)

| Offset: 0x0000 | | | Register Name: UART_THR |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:8 | / | / | / |
| 7:0 | W | 0x0 | <p>THR Transmit Holding Register</p> <p>Data is transmitted on the serial output port (SOUT) in UART mode or the serial infrared output (sir_out_n) in infrared mode. Data should only be written to the UART_THR when the THRE bit (UART_LSR[5]) is set.</p> <p>If in FIFO mode and FIFOs are enabled (UART_FCR[0] = 1) and THRE is set, the 16 number of characters data may be written to the UART_THR before the FIFO is full. When the FIFO is full, any written data results in the written data being lost.</p> |

9.2.6.3 0x0000 UART Divisor Latch Low Register (Default Value: 0x0000_0000)

| Offset: 0x0000 | | | Register Name: UART_DLL |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:8 | / | / | / |
| 7:0 | R/W | 0x0 | <p>DLL Divisor Latch Low</p> <p>Lower 8 bits of 16 bits, read/write, Divisor Latch Register contains the baud rate divisor for the UART. This register may only be accessed when the DLAB bit (UART_LCR[7]) is set and the UART is not busy (UART_USR[0] is 0).</p> <p>The output baud rate is equal to the serial clock (SCLK) frequency divided by sixteen times the value of the baud rate divisor, as follows: baud rate = (serial clock freq)/(16 * divisor).</p> <p>Note that when the Divisor Latch Registers (UART_DLL and UART_DLH) are set to 0, the baud clock is disabled and no serial communications occur. Also, once the DLL is set, at least 8 clock cycles of the slowest UART clock should be allowed to pass before transmitting or receiving data.</p> |

9.2.6.4 0x0004 UART Divisor Latch High Register (Default Value: 0x0000_0000)

| Offset: 0x0004 | | | Register Name: UART_DLH |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:8 | / | / | / |
| 7:0 | R/W | 0x0 | <p>DLH Divisor Latch High</p> <p>Upper 8 bits of 16 bits, read/write, Divisor Latch Register contains the baud rate divisor for the UART. This register may only be accessed when the DLAB bit (UART_LCR[7]) is set and the UART is not busy (UART_USR[0] is 0).</p> <p>The output baud rate is equal to the serial clock (SCLK) frequency divided by sixteen times the value of the baud rate divisor, as follows: baud rate = (serial clock freq)/(16 * divisor).</p> <p>Note that when the Divisor Latch Registers (UART_DLL and UART_DLH) is set to 0, the baud clock is disabled and no serial communications occur. Also, once the DLH is set, at least 8 clock cycles of the slowest UART clock should be allowed to pass before transmitting or receiving data.</p> |

9.2.6.5 0x0004 UART Interrupt Enable Register (Default Value: 0x0000_0000)

| Offset: 0x0004 | | | Register Name: UART_IER |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:8 | / | / | / |
| 7 | R/W | 0x0 | PTIME Programmable THRE Interrupt Mode Enable This is used to enable/disable the generation of THRE Interrupt. 0: Disable 1: Enable |
| 6:5 | / | / | / |
| 4 | R/W | 0x0 | RS485_INT_EN RS485 Interrupt Enable 0: Disable 1: Enable |
| 3 | R/W | 0x0 | EDSSI Enable Modem Status Interrupt This is used to enable/disable the generation of Modem Status Interrupt. This is the fourth highest priority interrupt. 0: Disable 1: Enable |
| 2 | R/W | 0x0 | ELSI Enable Receiver Line Status Interrupt This is used to enable/disable the generation of Receiver Line Status Interrupt. This is the highest priority interrupt. 0: Disable 1: Enable |
| 1 | R/W | 0x0 | ETBEI Enable Transmit Holding Register Empty Interrupt This is used to enable/disable the generation of Transmitter Holding Register Empty Interrupt. This is the third-highest priority interrupt. 0: Disable 1: Enable |

| Offset: 0x0004 | | | Register Name: UART_IER |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 0 | R/W | 0x0 | <p>ERBFF</p> <p>Enable Received Data Available Interrupt</p> <p>This is used to enable/disable the generation of Received Data Available Interrupt and the Character Timeout Interrupt (if in FIFO mode and FIFOs enabled). These are the second-highest priority interrupt.</p> <p>0: Disable 1: Enable</p> |

9.2.6.6 0x0008 UART Interrupt Identity Register (Default Value: 0x0000_0001)

| Offset: 0x0008 | | | Register Name: UART_IIR |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:8 | / | / | / |
| 7:6 | R | 0x0 | <p>FEFLAG</p> <p>FIFOs Enable Flag</p> <p>This is used to indicate whether the FIFOs are enabled or disabled.</p> <p>00: Disable 11: Enable</p> |
| 5:4 | / | / | / |
| 3:0 | R | 0x1 | <p>IID</p> <p>Interrupt ID</p> <p>This indicates the highest priority pending interrupt which can be one of the following types.</p> <p>0000: modem status 0001: no interrupt pending 0010: THR empty 0011: RS485 Interrupt 0100: received data available 0110: receiver line status 0111: busy detect 1100: character timeout</p> <p>The bit 3 indicates an interrupt can only occur when the FIFOs are enabled and used to distinguish a Character Timeout condition interrupt.</p> |

| Interrupt ID | Priority Level | Interrupt Type | Interrupt Source | Interrupt Reset |
|--------------|----------------|---------------------------------|---|--|
| 0001 | - | None | None | - |
| 0110 | Highest | Receiver line status | Overrun/parity/framing errors or break interrupt | Reading the line status register |
| 0011 | Second | RS485 Interrupt | In RS485 mode, receives address data and match setting address | Writes 1 to addr flag to reset |
| 0100 | Third | Received data available | Receiver data available (non-FIFO mode or FIFOs disabled) or RCVR FIFO trigger level reached (FIFO mode and FIFOs enabled) | Reading the receiver buffer register (non-FIFO mode or FIFOs disabled) or the FIFO drops below the trigger level (FIFO mode and FIFOs enabled) |
| 1100 | Fourth | Character timeout indication | No characters in or out of the RCVR FIFO during the last 4 character times and there is at least 1 character in it during This time | Reading the receiver buffer register |
| 0010 | Fifth | Transmit holding register empty | Transmitter holding register empty (Program THRE mode disabled) or XMIT FIFO at or below threshold (Program THRE mode enabled) | Reading the IIR register (if the source of interrupt); or, writing into THR (FIFOs or THRE mode not selected or disabled) or XMIT FIFO above threshold (FIFOs and THRE mode selected and enabled). |
| 0000 | Sixth | Modem status | Clear to send or data set ready or ring indicator or data carrier detect. Note that if the autoflow control mode is enabled, a change in CTS (that is, DCTS set) does not cause an interrupt. | Reading the Modem status register |
| 0111 | Seventh | Busy detect indication | UART_16550_COMPATIBLE = NO and master has tried to write to the Line Control Register while the UART is busy (USR[0] is set to one). | Reading the UART status register |

9.2.6.7 0x0008 UART FIFO Control Register (Default Value: 0x0000_0000)

| Offset: 0x0008 | | | Register Name: UART_FCR |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:8 | / | / | / |
| 7:6 | W | 0x0 | <p>RT RCVR Trigger</p> <p>This is used to select the trigger level in the receiver FIFO when the Received Data Available Interrupt is generated. In the autoflow control mode, it is used to determine when the rts_n signal is de-asserted. It also determines when the dma_rx_req_n signal is asserted in certain modes of operation.</p> <p>00: 1 character in the FIFO 01: FIFO ¼ full 10: FIFO ½ full 11: FIFO-2 less than full</p> |
| 5:4 | W | 0x0 | <p>TFT TX Empty Trigger</p> <p>This is used to select the empty threshold level when the THRE Interrupts are generated and the mode is active. It also determines when the dma_tx_req_n signal is asserted in certain modes of operation.</p> <p>00: FIFO empty 01: 2 characters in the FIFO 10: FIFO ¼ full 11: FIFO ½ full</p> |

| Offset: 0x0008 | | | Register Name: UART_FCR |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 3 | W | 0x0 | <p>DMAM DMA Mode</p> <p>0: Mode 0</p> <p>In this mode, when the PTE in UART_HALT is high and TX FIFO is enabled, the TX DMA request will be set when the TFL in UART_TFL is less than or equal to FIFO Trigger Level (otherwise it will be cleared). When the PTE is high and TX FIFO is disabled, the TX DMA request will be set only if the THR in UART_THR is empty. If the PTE is low, the TX DMA request will be set only if the TX FIFO (TX FIFO enabled) or THR (TX FIFO disabled) is empty.</p> <p>When the DMA_PTE_RX in UART_HALT is high and RX FIFO is enabled, the RX DRQ will be set only if the RFL in UART_RFL is equal to or more than FIFO Trigger Level, otherwise, it will be cleared.</p> <p>1: Mode 1</p> <p>In this mode, TX FIFO should be enabled. If the PTE in UART_HALT is high, the TX DMA request will be set when the TFL in UART_TFL is less than or equal to FIFO Trigger Level; If the PTE is low, the TX DMA request will be set when TX FIFO is empty. Once the request is set, it is cleared only when TX FIFO is full.</p> <p>If the RFL in UART_RFL is equal to or more than FIFO Trigger Level or there is a character timeout, the RX DRQ will be set; Once the RX DRQ is set, it is cleared only when RX FIFO (RX FIFO enabled) or RBR (RX FIFO disabled) is empty.</p> |
| 2 | W | 0x0 | <p>XFIFOR XMIT FIFO Reset</p> <p>The bit resets the control part of the transfer FIFO and treats the FIFO as empty. This also de-asserts the DMA TX request. It is 'self-cleared'. It is not necessary to clear this bit.</p> |
| 1 | W | 0x0 | <p>RFIFOR RCVR FIFO Reset</p> <p>The bit resets the control part of the receive FIFO and treats the FIFO as empty. This also de-asserts the DMA RX request. It is 'self-cleared'. It is not necessary to clear this bit.</p> |
| 0 | W | 0x0 | <p>FIFOE Enable FIFOs</p> <p>The bit enables/disables the transmitting (XMIT) and receiving (RCVR) FIFOs. Whenever the value of this bit is changed, both the XMIT and RCVR controller part of FIFOs is reset.</p> |

9.2.6.8 0x000C UART Line Control Register (Default Value: 0x0000_0000)

| Offset: 0x000C | | | Register Name: UART_LCR |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:8 | / | / | / |
| 7 | R/W | 0x0 | <p>DLAB</p> <p>Divisor Latch Access Bit</p> <p>It is writable only when UART is not busy (UART_USR[0] is 0) and always readable. This bit is used to enable the reading and writing of the Divisor Latch register (UART_DLL and UART_DLH) to set the baud rate of the UART. This bit must be cleared after the initial baud rate setup in order to access other registers.</p> <p>0: Select RX Buffer Register (UART_RBR)/TX Holding Register (UART_THR) and Interrupt Enable Register (UART_IER)</p> <p>1: Select Divisor Latch LS Register (UART_DLL) and Divisor Latch MS Register (UART_DLM)</p> |
| 6 | R/W | 0x0 | <p>BC</p> <p>Break Control Bit</p> <p>This is used to cause a break condition to be transmitted to the receiving device. If set to 0, the serial output is forced to the spacing (logic 0) state. When not in Loopback mode, as determined by UART_MCR[4], the SOUT line is forced low until the Break bit is cleared. If SIR_MODE is enabled and active (UART_MCR[6] is set to 1), the sir_out_n line is continuously pulsed. When in Loopback mode, the break condition is internally looped back to the receiver and the sir_out_n line is forced low.</p> |

| Offset: 0x000C | | | Register Name: UART_LCR |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 5:4 | R/W | 0x0 | <p>EPS Even Parity Select</p> <p>It is writable only when UART is not busy (UART_USR[0] is 0). This is used to select the even and odd parity when the PEN is enabled (the UART_LCR[3] is set to 1). Setting the UART_LCR[5] is unset to reverse the LCR[4].</p> <p>00: Odd Parity 01: Even Parity 1X: Reverse LCR[4]</p> <p>In RS485 mode, it is the 9th bit--address bit.</p> <p>11: 9th bit = 0, indicates that this is a data byte. 10: 9th bit = 1, indicates that this is an address byte.</p> <p>Note: When using this function, the PEN(UART_LCR[3]) must set to 1.</p> |
| 3 | R/W | 0x0 | <p>PEN Parity Enable</p> <p>It is writable only when UART is not busy (UART_USR[0] is 0) and always readable. This bit is used to enable and disable parity generation and detection in transmitted and received serial characters respectively.</p> <p>0: Parity disabled 1: Parity enabled</p> |
| 2 | R/W | 0x0 | <p>STOP Number of stop bits</p> <p>It is writable only when UART is not busy (UART_USR[0] is 0) and always readable. This is used to select the number of stop bits per character that the peripheral transmits and receives. If set to 0, one stop bit is transmitted in the serial data. If set to 1 and the data bits are set to 5 (UART_LCR[1:0] is 0), one and a half stop bit is transmitted. Otherwise, two stop bits are transmitted. Note that regardless of the number of stop bits selected, the receiver checks only the first stop bit.</p> <p>0: 1 stop bit 1: 1.5 stop bits when DLS (LCR[1:0]) is zero, else 2 stop bit</p> |

| Offset: 0x000C | | | Register Name: UART_LCR |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 1:0 | R/W | 0x0 | <p>DLS Data Length Select</p> <p>It is writable only when UART is not busy (UART_USR[0] is 0) and always readable. This is used to select the count of bits in a transmitted or received frame.</p> <p>00: 5 bits 01: 6 bits 10: 7 bits 11: 8 bits</p> |

9.2.6.9 0x0010 UART Modem Control Register (Default Value: 0x0000_0000)

| Offset: 0x0010 | | | Register Name: UART_MCR |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:8 | / | / | / |
| 7:6 | R/W | 0x0 | <p>UART_FUNCTION Select IrDA or RS485</p> <p>00: UART Mode 01: IrDA SIR Mode 10: RS485 Mode 11: Reserved</p> |
| 5 | R/W | 0x0 | <p>AFCE Auto Flow Control Enable</p> <p>When FIFOs are enabled and the AFCE bit is set, the AutoFlow Control is enabled.</p> <p>0: Auto Flow Control mode disabled 1: Auto Flow Control mode enabled</p> |

| Offset: 0x0010 | | | Register Name: UART_MCR |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 4 | R/W | 0x0 | <p>LOOP</p> <p>Loop Back Mode</p> <p>0: Normal Mode</p> <p>1: Loop Back Mode</p> <p>This is used to put the UART into a diagnostic mode for test purposes. If operating in UART mode (SIR_MODE != Enabled or not active, UART_MCR[6] is set to 0), the data on the SOUT line is held high, while serial data output is looped back to the sin line, internally. In this mode, all the interrupts are fully functional. Also, in loopback mode, the modem control inputs (dsr_n, cts_n, ri_n, dcd_n) are disconnected and the modem control outputs (dtr_n, rts_n, out1_n, out2_n) are looped back to the inputs, internally. If operating in infrared mode (SIR_MODE == Enabled AND active, UART_MCR[6] is set to 1), the data on the sir_out_n line is held low, while serial data output is inverted and looped back to the sir_in line.</p> |
| 3:2 | / | / | / |
| 1 | R/W | 0x0 | <p>RTS</p> <p>Request to Send</p> <p>This is used to directly control the Request to Send (rts_n) output. The RTS (rts_n) output is used to inform the modem or data set that the UART is ready to exchange data. When Auto RTS Flow Control is not enabled (UART_MCR[5] is set to 0), the rts_n signal is set low by programming UART_MCR[1] (RTS) to a high. In Auto Flow Control, AFCE_MODE == Enabled and active (UART_MCR[5] is set to 1) and FIFOs enable (UART_FCR[0] is set to 1), the rts_n output is controlled in the same way, but is also gated with the receiver FIFO threshold trigger (rts_n is inactive high when above the threshold). The rts_n signal is de-asserted when UART_MCR[1] is set low.</p> <p>0: rts_n de-asserted (logic 1)</p> <p>1: rts_n asserted (logic 0)</p> <p>Note that in Loopback mode (UART_MCR[4] is set to 1), the rts_n output is held inactive high while the value of this location is internally looped back to an input.</p> |

| Offset: 0x0010 | | | Register Name: UART_MCR |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 0 | R/W | 0x0 | <p>DTR Data Terminal Ready</p> <p>This is used to directly control the Data Terminal Ready (dtr_n) output. The value written to this location is inverted and driven out on dtr_n.</p> <p>0: dtr_n de-asserted (logic 1) 1: dtr_n asserted (logic 0)</p> <p>The DTR output is used to inform the modem or data set that the UART is ready to establish communications.</p> <p>Note that in Loopback mode (UART_MCR[4] is set to 1), the dtr_n output is held inactive high while the value of this location is internally looped back to an input.</p> |

9.2.6.10 0x0014 UART Line Status Register (Default Value: 0x0000_0060)

| Offset:0x0014 | | | Register Name: UART_LSR |
|---------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:8 | / | / | / |
| 7 | R | 0x0 | <p>FIFOERR RX Data Error in FIFO</p> <p>When FIFOs are disabled, this bit is always 0. When FIFOs are enabled, this bit is set to "1" when there is at least one PE, FE, or BI in the RX FIFO. It is cleared by reading from the UART_LSR register, there are no subsequent errors in the FIFO.</p> |
| 6 | R | 0x1 | <p>TEMT Transmitter Empty</p> <p>If the FIFOs are disabled, this bit is set to "1" whenever the TX Holding Register (UART_THR) and the TX Shift Register are empty. If the FIFOs are enabled, this bit is set whenever the TX FIFO and the TX Shift Register are empty. In both cases, this bit is cleared when a byte is written to the TX data channel.</p> |

| Offset:0x0014 | | | Register Name: UART_LSR |
|---------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 5 | R | 0x1 | <p>THRE</p> <p>TX Holding Register Empty</p> <p>If the FIFOs are disabled, this bit is set to "1" when the TX Holding Register (UART_THR) is empty and ready to accept new data and it is cleared when the CPU writes to the TX Holding Register.</p> <p>If the FIFOs are enabled, this bit is set to "1" whenever the TX FIFO is empty and it is cleared when at least one byte is written to the TX FIFO.</p> |
| 4 | R | 0x0 | <p>BI</p> <p>Break Interrupt</p> <p>This is used to indicate the detection of a break sequence on the serial input data.</p> <p>If in UART mode (SIR_MODE == Disabled), it is set when the serial input, <i>sir_in</i>, is held in a logic '0' state for longer than the sum of <i>start time + data bits + parity + stop bits</i>.</p> <p>If in infrared mode (SIR_MODE == Enabled), it is set when the serial input, <i>sir_in</i>, is continuously pulsed to logic '0' for longer than the sum of <i>start time + data bits + parity + stop bits</i>. A break condition on serial input causes one and only one character, consisting of all zeros, to be received by the UART.</p> <p>In the FIFO mode, the character associated with the break condition is carried through the FIFO and is revealed when the character is at the top of the FIFO. Reading the UART_LSR clears the BI bit. In the non-FIFO mode, the BI indication occurs immediately and persists until the UART_LSR is read.</p> |

| Offset:0x0014 | | | Register Name: UART_LSR |
|---------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 3 | RC | 0x0 | <p>FE</p> <p>Framing Error</p> <p>This is used to indicate the occurrence of a framing error in the receiver. A framing error occurs when the receiver does not detect a valid STOP bit in the received data.</p> <p>In the FIFO mode, since the framing error is associated with a character received, it is revealed when the character with the framing error is at the top of the FIFO. When a framing error occurs, the UART tries to resynchronize. It does this by assuming that the error was due to the start bit of the next character and then continues receiving the other bit i.e. data, and/or parity and stop. It should be noted that the Framing Error (FE) bit (UART_LSR[3]) is set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (UART_LSR[4]).</p> <p>0: no framing error 1: framing error</p> <p>Reading the UART_LSR clears the FE bit.</p> |
| 2 | RC | 0x0 | <p>PE</p> <p>Parity Error</p> <p>This is used to indicate the occurrence of a parity error in the receiver if the Parity Enable (PEN) bit (UART_LCR[3]) is set. In the FIFO mode, since the parity error is associated with a character received, it is revealed when the character with the parity error arrives at the top of the FIFO. It should be noted that the Parity Error (PE) bit (UART_LSR[2]) is set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (UART_LSR[4]).</p> <p>0: no parity error 1: parity error</p> <p>Reading the UART_LSR clears the PE bit.</p> |

| Offset:0x0014 | | | Register Name: UART_LSR |
|---------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 1 | RC | 0x0 | <p>OE Overrun Error</p> <p>This occurs if a new data character was received before the previous data was read. In the non-FIFO mode, the OE bit is set when a new character arrives in the receiver before the previous character was read from the UART_RBR. When this happens, the data in the UART_RBR is overwritten. In the FIFO mode, an overrun error occurs when the FIFO is full and a new character arrives at the receiver. The data in the FIFO is retained and the data in the receive shift register is lost.</p> <p>0: no overrun error 1: overrun error</p> <p>Reading the UART_LSR clears the OE bit.</p> |
| 0 | R | 0x0 | <p>DR Data Ready</p> <p>This is used to indicate that the receiver contains at least one character in the UART_RBR or the receiver FIFO.</p> <p>0: no data ready 1: data ready</p> <p>This bit is cleared when the UART_RBR is read in non-FIFO mode, or when the receiver FIFO is empty, in FIFO mode.</p> <p>Note: Not use when the RXDMA master is enabled (rxdma_ctrl[0] is set to 1).</p> |

9.2.6.11 0x0018 UART Modem Status Register (Default Value: 0x0000_0000)

| Offset: 0x0018 | | | Register Name: UART_MSR |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:8 | / | / | / |
| 7 | R | 0x0 | <p>DCD Line State of Data Carrier Detect</p> <p>This is used to indicate the current state of the modem control line dcd_n. This bit is the complement of dcd_n. When the Data Carrier Detect input (dcd_n) is asserted it is an indication that the carrier has been detected by the modem or data set.</p> <p>0: dcd_n input is de-asserted (logic 1) 1: dcd_n input is asserted (logic 0)</p> |

| Offset: 0x0018 | | | Register Name: UART_MSR |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 6 | R | 0x0 | <p>RI</p> <p>Line State of Ring Indicator</p> <p>This is used to indicate the current state of the modem control line ri_n. This bit is the complement of ri_n. When the Ring Indicator input (ri_n) is asserted it is an indication that a telephone ringing signal has been received by setting the modem or data.</p> <p>0: ri_n input is de-asserted (logic 1)</p> <p>1: ri_n input is asserted (logic 0)</p> |
| 5 | R | 0x0 | <p>DSR</p> <p>Line State of Data Set Ready</p> <p>This is used to indicate the current state of the modem control line dsr_n. This bit is the complement of the dsr_n. When the Data Set Ready input (dsr_n) is asserted, it is an indication that the modem or data set is ready to establish communication with UART.</p> <p>0: dsr_n input is de-asserted (logic 1)</p> <p>1: dsr_n input is asserted (logic 0)</p> <p>In Loopback Mode (UART_MCR[4] is set to 1), the DSR is the same as the DTR (UART_MCR[0]).</p> |
| 4 | R | 0x0 | <p>CTS</p> <p>Line State of Clear To Send</p> <p>This is used to indicate the current state of the modem control line cts_n. This bit is the complement of cts_n. When the Clear to Send input (cts_n) is asserted, it is an indication that the modem or data set is ready to exchange data with UART.</p> <p>0: cts_n input is de-asserted (logic 1)</p> <p>1: cts_n input is asserted (logic 0)</p> <p>In Loopback Mode (UART_MCR[4] = 1), the CTS is the same as the RTS (UART_MCR[1]).</p> |

| Offset: 0x0018 | | | Register Name: UART_MSR |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 3 | RC | 0x0 | <p>DDCD Delta Data Carrier Detect</p> <p>This is used to indicate that the modem control line dcd_n has changed since the last time the UART_MSR was read.</p> <p>0: no change on dcd_n since the last read of UART_MSR 1: change on dcd_n since the last read of UART_MSR</p> <p>Reading the UART_MSR clears the DDCD bit.</p> <p>Note: If the DDCD bit is not set and the dcd_n signal is asserted (low) and a reset occurs, then the DDCD bit is set when the reset is removed if the dcd_n signal remains asserted.</p> |
| 2 | RC | 0x0 | <p>TERI Trailing Edge Ring Indicator</p> <p>This is used to indicate that a change in the input ri_n (from an active-low to an inactive-high state) has occurred since the last time the UART_MSR was read.</p> <p>0: no change on ri_n since the last read of UART_MSR 1: change on ri_n since the last read of UART_MSR</p> <p>Reading the UART_MSR clears the TERI bit.</p> |
| 1 | RC | 0x0 | <p>DDSR Delta Data Set Ready</p> <p>This is used to indicate that the modem control line dsr_n has changed since the last time the UART_MSR was read.</p> <p>0: no change on dsr_n since the last read of UART_MSR 1: change on dsr_n since the last read of UART_MSR</p> <p>Reading the UART_MSR clears the DDSR bit. In Loopback Mode (UART_MCR[4] = 1), the DDSR reflects changes on the DTR (UART_MCR[0]).</p> <p>Note: If the DDSR bit is not set and the dsr_n signal is asserted (low) and a reset occurs, then the DDSR bit is set when the reset is removed if the dsr_n signal remains asserted.</p> |

| Offset: 0x0018 | | | Register Name: UART_MSR |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 0 | RC | 0x0 | <p>DCTS Delta Clear to Send</p> <p>This is used to indicate that the modem control line cts_n has changed since the last time the UART_MSR was read.</p> <p>0: no change on ctsdsr_n since the last read of UART_MSR 1: change on ctsdsr_n since the last read of UART_MSR</p> <p>Reading the UART_MSR clears the DCTS bit. In Loopback Mode (UART_MCR[4] = 1), the DCTS reflects changes on the RTS (UART_MCR[1]).</p> <p>Note: If the DCTS bit is not set and the cts_n signal is asserted (low) and a reset occurs, then the DCTS bit is set when the reset is removed if the cts_n signal remains asserted.</p> |

9.2.6.12 0x001C UART Scratch Register (Default Value: 0x0000_0000)

| Offset: 0x001C | | | Register Name: UART_SCH |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:8 | / | / | / |
| 7:0 | R/W | 0x0 | <p>SCRATCH_REG Scratch Register</p> <p>This register is for programmers to use as a temporary storage space. It has no defined purpose in the UART.</p> |

9.2.6.13 0x007C UART Status Register (Default Value: 0x0000_0006)

| Offset: 0x007C | | | Register Name: UART_USR |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:5 | / | / | / |
| 4 | R | 0x0 | <p>RFF RX FIFO Full</p> <p>This is used to indicate that the RX FIFO is completely full.</p> <p>0: RX FIFO not full 1: RX FIFO Full</p> <p>This bit is cleared when the RX FIFO is no longer full.</p> |

| Offset: 0x007C | | | Register Name: UART_USR |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 3 | R | 0x0 | <p>RFNE RX FIFO Not Empty</p> <p>This is used to indicate that the RX FIFO contains one or more entries.</p> <p>0: RX FIFO is empty 1: RX FIFO is not empty</p> <p>This bit is cleared when the RX FIFO is empty.</p> |
| 2 | R | 0x1 | <p>TFE TX FIFO Empty</p> <p>This is used to indicate that the TX FIFO is completely empty.</p> <p>0: TX FIFO is not empty 1: TX FIFO is empty</p> <p>This bit is cleared when the TX FIFO is no longer empty.</p> |
| 1 | R | 0x1 | <p>TFNF TX FIFO Not Full</p> <p>This is used to indicate that the TX FIFO is not full.</p> <p>0: TX FIFO is full 1: TX FIFO is not full</p> <p>This bit is cleared when the TX FIFO is full.</p> |
| 0 | R | 0x0 | <p>BUSY UART Busy Bit</p> <p>0: Idle or inactive 1: Busy</p> |

9.2.6.14 0x0080 UART Transmit FIFO Level Register (Default Value: 0x0000_0000)

| Offset: 0x0080 | | | Register Name: UART_TFL |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:9 | / | / | / |
| 8:0 | R | 0x0 | <p>TFL TX FIFO Level</p> <p>The bit indicates the number of data entries in the TX FIFO.</p> |

9.2.6.15 0x0084 UART Receive FIFO Level Register (Default Value: 0x0000_0000)

| Offset: 0x0084 | | | Register Name: UART_RFL |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:9 | / | / | / |
| 8:0 | R | 0x0 | RFL RX FIFO Level The bit indicates the number of data entries in the RX FIFO. Note: Not use when the RXDMA master is enabled (UART_RXDMA_CTRL[0] is set to 1). |

9.2.6.16 0x0088 UART DMA Handshake Configuration Register (Default Value: 0x0000_00A5)

| Offset: 0x0088 | | | Register Name: UART_HSK |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:8 | / | / | / |
| 7:0 | R/W | 0xA5 | Handshake configuration 0xA5: DMA wait cycle mode 0xE5: DMA handshake mode |

9.2.6.17 0x008C UART DMA Request Enable Register(Default Value: 0x0000_0003)

| Offset: 0x008C | | | Register Name: UART_DMA_REQ_EN |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:3 | / | / | / |
| 2 | R/W | 0x0 | DMA Timeout Enable 0: Disable 1: Enable |
| 1 | R/W | 0x1 | DMA TX REQ Enable 0: Disable 1: Enable |
| 0 | R/W | 0x1 | DMA RX REQ Enable 0: Disable 1: Enable |

9.2.6.18 0x00A4 UART Halt TX Register (Default Value: 0x0000_0000)

| Offset: 0x00A4 | | | Register Name: UART_HALT |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:8 | / | / | / |
| 7 | R/W | 0x0 | <p>PTE</p> <p>The sending of TX_REQ</p> <p>In DMA1 mode (FIFO on), if the PTE is set to 1 when the TFL in UART_TFL is less than or equal to the trigger value, the controller sends the DMA request. If the PTE is set to 0, when FIFO is empty, the controller sends the DMA request. The DMA request will stop when FIFO is full.</p> <p>In DMA0 mode, if the PTE is set to 1 and FIFO is on, when the TFL in UART_TFL is less than or equal to the trigger value, the controller sends DMA request. If the PTE is set to 1 and FIFO off, when the THR in UART_THR is empty, the controller sends DMA request. If the PTE is set to 0, when FIFO(FIFO Enable) or THR(FIFO Enable) is empty, the controller sends DMA request. Otherwise, the DMA request is cleared.</p> |
| 6 | R/W | 0x0 | <p>DMA_PTE_RX</p> <p>The Transmission of RX_DRQ</p> <p>In DMA1 mode, when RFL is more than or equal to the trigger value, or a receive timeout has occurred, the controller sends DRQ.</p> <p>In DMA0 mode, when DMA_PTE_RX = 1 and FIFO is on, if RFL is more than or equal to trig, the controller sends DRQ, else DRQ is cleared. In other cases, once the received data is valid, the controller sends DRQ.</p> |
| 5 | R/W | 0x0 | <p>SIR_RX_INVERT</p> <p>SIR RX Pulse Polarity Invert</p> <p>0: Not invert receiver signal</p> <p>1: Invert receiver signal</p> |
| 4 | R/W | 0x0 | <p>SIR_TX_INVERT</p> <p>SIR TX Pulse Polarity Invert</p> <p>0: Not invert transmit pulse</p> <p>1: Invert transmit pulse</p> |
| 3 | / | / | / |

| Offset: 0x00A4 | | | Register Name: UART_HALT |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 2 | R/WAC | 0x0 | <p>CHANGE_UPDATE</p> <p>After the user uses UART_HALT[1] to change the baud rate or LCR configuration, write 1 to update the configuration and wait this bit to self-clear to 0 to finish update process. Writing 0 to this bit has no effect.</p> <p>1: Update trigger, self-clear to 0 when finish update.</p> |
| 1 | R/W | 0x0 | <p>CHCFG_AT_BUSY</p> <p>This is an enable bit for the user to change LCR register configuration and baud rate register (UART_DLH and UART_DLL) when the UART is busy.</p> <p>1: Enable change when busy</p> |
| 0 | R/W | 0x0 | <p>HALT_TX</p> <p>Halt TX</p> <p>This register is used to halt transmissions for testing, so that the transmit FIFO can be filled by the master when FIFOs are implemented and enabled.</p> <p>0 : Halt TX disabled 1 : Halt TX enabled</p> <p>Note: If FIFOs are not enabled, the setting has no effect on operation.</p> |

9.2.6.19 0x00B0 UART DBG DLL Register (Default Value: 0x0000_0000)

| Offset: 0x00B0 | | | Register Name: UART_DBG_DLL |
|----------------|------------|-------------|-----------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:8 | / | / | / |
| 7:0 | R | 0x0 | DEBUG DLL |

9.2.6.20 0x00B4 UART DBG DLH Register (Default Value: 0x0000_0000)

| Offset: 0x00B4 | | | Register Name: UART_DBG_DLH |
|----------------|------------|-------------|-----------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:8 | / | / | / |
| 7:0 | R | 0x0 | DEBUG DLH |

9.2.6.21 0x00F0 UART FIFO Clock Control Register (Default Value: 0x0000_0003)

| Offset: 0x00F0 | | | Register Name: UART_FCC |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:8 | R | 0x0 | FIFO Depth Indicates the depth of TX/RX FIFO |
| 7:3 | / | / | / |
| 2 | R/W | 0x0 | RXFIFO Clock Mode 0: Sync mode, writing/reading clocks use apb clock 1: Sync mode, writing clock uses apb clock, reading clock uses ahb clock |
| 1 | R/W | 0x1 | TX FIFO Clock Enable 0: Clock disable 1: Clock enable |
| 0 | R/W | 0x1 | RX FIFO Clock Enable 0: Clock disable 1: Clock enable |

9.2.6.22 0x0100 UART RXDMA Control Register (Default Value: 0x0000_0000)

| Offset: 0x0100 | | | Register Name: UART_RXDMA_CTRL |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:24 | / | / | / |
| 23:8 | R/W | 0x0 | RXDMA Timeout Threshold Unit is 1 UART bit time Note that this field is only configurable when RXDMA Busy is 0. |
| 7 | / | / | / |
| 6 | R/W | 0x0 | RXDMA Timeout Enable Once enable, the DMA starts a transfer even the data entries in RX FIFO do not reach BLK_SIZE. Note that this field is only configurable when RXDMA Busy is 0. |

| Offset: 0x0100 | | | Register Name: UART_RXDMA_CTRL |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 5:4 | R/W | 0x0 | <p>RXDMA AHB Burst Mode</p> <p>Set for AHB port burst supported</p> <p>INCR8 is recommended, while INCR16 may be unsupported due to the system bus.</p> <p>00: SIGNLE</p> <p>01: INCR4</p> <p>10: INCR8</p> <p>11: INCR16</p> <p>Note that this field is only configurable while RXDMA Busy is 0.</p> |
| 3:2 | R/W | 0x0 | <p>RXDMA BLK SIZE</p> <p>Every time when data entries in RX FIFO reach BLK_SIZE, start a DMA block transfer. It is recommended that the block size no more than RX FIFO Depth.</p> <p>00: 8 bytes</p> <p>01: 16 bytes</p> <p>10: 32 bytes</p> <p>11: 64 bytes</p> <p>Note that this field is only configurable while RXDMA Busy is 0.</p> |
| 1 | R/W | 0x0 | <p>RXDMA Mode</p> <p>0: Continuous</p> <p>1: Limited</p> <p>When data transferred reaches the limited count set in RXDMA LIMIT, the DMA stops and the RXDMA Start bit is cleared automatically.</p> <p>Note that this field is only configurable while RXDMA Busy is 0.</p> |
| 0 | R/W | 0x0 | <p>RXDMA Enable</p> <p>0: RXDMA Disable</p> <p>1: RXDMA Enable</p> <p>Note that if the software turns off this bit, the RXDMA will stop after the current block transfer completes, then the software should do a reset to the RX FIFO before re-enable.</p> |

9.2.6.23 0x0104 UART RXDMA Start Register (Default Value: 0x0000_0000)

| Offset: 0x0104 | | | Register Name: UART_RXDMA_STR |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:2 | / | / | / |
| 0 | R/WAC | 0x0 | RXDMA Start Only valid when RXDMA mode is set to 1, it is auto cleared when data transferred reaches the RXDMA Limit Size. |

9.2.6.24 0x0108 UART RXDMA Status Register (Default Value: 0x0000_0000)

| Offset: 0x0108 | | | Register Name: UART_RXDMA_STA |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:1 | / | / | / |
| 1 | R | 0x0 | Buffer Read Address Updating 0: Buffer Read Address Register is ready for updating 1: Buffer Read Address Register is busy for updating The software should not update Buffer Read Address Register until this bit is 0. |
| 0 | R | 0x0 | RXDMA BUSY 0: RXDMA is idle 1: RXDMA is busy |

9.2.6.25 0x010C UART RXDMA Limit Register (Default Value: 0x0000_0000)

| Offset: 0x010C | | | Register Name: UART_RXDMA_LMT |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15:0 | R/W | 0x0 | RXDMA Limit Size Only valid when RXDMA Mode is set to 1, and the unit is byte. Note that this field is only configurable while RXDMA Busy is 0. |

9.2.6.26 0x0110 UART RXDMA Buffer Start Address Low Register (Default Value: 0x0000_0000)

| Offset: 0x0110 | | | Register Name: UART_RXDMA_SADDRL |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | RXDMA Buffer Start Address [31:0] Byte address Note that this field is only configurable while RXDMA Busy is 0. |

9.2.6.27 0x0114 UART RXDMA Buffer Start Address High Register (Default Value: 0x0000_0000)

| Offset: 0x0114 | | | Register Name: UART_RXDMA_SADDRH |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:2 | / | / | / |
| 1:0 | R/W | 0x0 | RXDMA Buffer Start Address [33:32] Byte address Note that this field is only configurable while RXDMA Busy is 0. |

9.2.6.28 0x0118 UART RXDMA Buffer Length Register (Default Value: 0x0000_0000)

| Offset: 0x0118 | | | Register Name: UART_RXDMA_BL |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15:0 | R/W | 0x0 | RXDMA Buffer Length Unit is byte Note that this field is only configurable while RXDMA Busy is 0. |

9.2.6.29 0x0120 UART RXDMA Interrupt Enable Register (Default Value: 0x0000_0000)

| Offset: 0x0120 | | | Register Name: UART_RXDMA_IE |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:4 | / | / | / |
| 3 | R/W | 0x0 | RXDMA Buffer Overrun RXDMA Buffer Overrun Interrupt Enable |

| Offset: 0x0120 | | | Register Name: UART_RXDMA_IE |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 2 | R/W | 0x0 | RXDMA Timeout Done RXDMA Timeout Done Interrupt Enable |
| 1 | R/W | 0x0 | RXDMA BLK Done RXDMA BLK Done Interrupt Enable |
| 0 | R/W | 0x0 | RXDMA Limit Done RXDMA Limit Done Interrupt Enable |

9.2.6.30 0x0124 UART RXDMA Interrupt Status Register (Default Value: 0x0000_0000)

| Offset: 0x0124 | | | Register Name: UART_RXDMA_IS |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:4 | / | / | / |
| 3 | R/W1C | 0x0 | RXDMA Buffer Overrun Asserted when the RXDMA buffer is overflow. |
| 2 | R/W1C | 0x0 | RXDMA Timeout Done Asserted when a DMA transfer caused by timeout is done. |
| 1 | R/W1C | 0x0 | RXDMA BLK Done Asserted when a DMA block transfer is done. |
| 0 | R/W1C | 0x0 | RXDMA Limit Done Asserted when data transferred reaches limit size in RXDMA Limit Mode. |

9.2.6.31 0x0128 UART RXDMA Write Address Low Register (Default Value: 0x0000_0000)

| Offset: 0x0128 | | | Register Name: UART_RXDMA_WADDRL |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | RXDMA Current Write Address[31:0] Updated when every DMA transfer is done It is byte address. |

9.2.6.32 0x012C UART RXDMA Write Address High Register (Default Value: 0x0000_0000)

| Offset: 0x012C | | | Register Name: UART_RXDMA_WADDRH |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:2 | / | / | / |
| 1:0 | R | 0x0 | RXDMA Current Write Address[33:32] Updated when every DMA transfer is done It is byte address. |

9.2.6.33 0x0130 UART RXDMA Read Address Low Register (Default Value: 0x0000_0000)

| Offset: 0x0130 | | | Register Name: UART_RXDMA_RADDRL |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | RXDMA Current Read Address[31:0] Software should update this register after reading data in RXDMA Buffer in time It is byte address. The software should not update Buffer Read Address Register until UART_RXDMA_STA[1] is 0. The software should update Read Address High Register first, and then Read Address Low Register, even there is no change on Read Address High Register. |

9.2.6.34 0x0134 UART RXDMA Read Address High Register (Default Value: 0x0000_0000)

| Offset: 0x0134 | | | Register Name: UART_RXDMA_RADDRH |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:2 | / | / | / |
| 1:0 | R/W | 0x0 | RXDMA Current Read Address[33:32] Software should update this register after reading data in RXDMA Buffer in time. It is byte address. The software should not update Buffer Read Address Register until until UART_RXDMA_STA[1] is 0. The software should update Read Address High Register first and then Read Address Low Register , even there is no change on Read Address High Register. |

9.2.6.35 0x0138 UART RXDMA Data Count Register (Default Value: 0x0000_0000)

| Offset: 0x0138 | | | Register Name: UART_RXDMA_DCNT |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15:0 | R | 0x0 | RXDMA Data Count Only valid while RXDMA Mode is set to 1, it is used for counting the data transferred by RXDMA, and is cleared when reaches RXDMA Limit Size. Its unit is byte. |

9.3 SPI

9.3.1 Overview

The Serial Peripheral Interface (SPI) is a full-duplex, synchronous, four-wire serial communication interface between a CPU and SPI-compliant external devices. The SPI controller contains a 64 x 8 bits receiver buffer (RXFIFO) and a 64 x 8 bits transmit buffer (TXFIFO). It can work in master mode and slave mode.

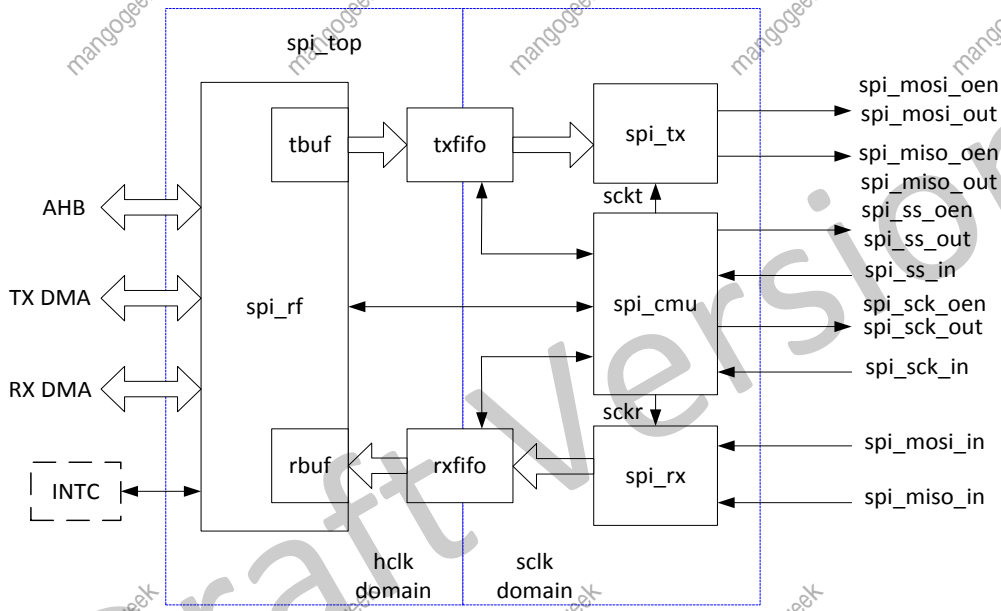

The SPI has the following features:

- Full-duplex synchronous serial interface
- Master/slave configurable
- 8-bit wide by 64-entry FIFO for both transmit and receive data
- Polarity and phase of the Chip Select (SPI_SS) and SPI Clock (SPI_SCLK) are configurable
- Supports interrupts and DMA
- Supports mode0, mode1, mode2, and mode3
- Supports 3-wire/4-wire SPI
- Supports programmable serial data frame length: 1 bit to 32 bits
- Supports standard SPI, dual-output/dual-input SPI, dual I/O SPI, quad-output/quad-input SPI
- Supports maximum IO rate of the mass production: 100 MHz

9.3.2 Block Diagram

Figure 9-20 shows a block diagram of the SPI.

Figure 9-20 SPI Block Diagram

SPI contains the following sub-blocks:

Table 9-6 SPI Sub-blocks

| Sub-block | Description |
|----------------|---|
| spi_rf | Responsible for implementing the internal register, interrupt, and DMA Request. |
| spi_tbuf | The data length transmitted from AHB to TXFIFO is converted into 8 bits, then the data is written into the RXFIFO. |
| spi_rbuf | The block is used to convert the RXFIFO data into the reading data length of AHB. |
| txfifo, rxfifo | The data transmitted from the SPI to the external serial device is written into the TXFIFO; the data received from the external serial device into SPI is pushed into the RXFIFO. |
| spi_cmdu | Responsible for implementing SPI bus clock, chip select, internal sample, and the generation of transfer clock. |
| spi_tx | Responsible for implementing SPI data transfer, the interface of the internal TXFIFO, and status register. |
| spi_rx | Responsible for implementing SPI data receive, the interface of the internal RXFIFO, and status register. |

9.3.3 Functional Description

9.3.3.1 External Signals

The following table describes the external signals of SPI. The MOSI and MISO are bidirectional I/O, when SPI is as a master device, the CLK and CS are the output pin; when SPI is as a slave device, the CLK and CS are the input pin. When using SPI, the corresponding PADS are selected as SPI function via section 9.7 “GPIO”.

Table 9-7 SPI External Signals

| Signal | Description | Type |
|-----------|--|------|
| SPI0-CS | SPI0 chip select signal, low active When the device is not selected, data will not be accepted via the SI pin, and the SO pin will stop transmission. | I/O |
| SPI0-CLK | SPI0 clock signal This pin is used to provide a clock to the device and is used to control the flow of data to and from the device. | I/O |
| SPI0-MOSI | SPI0 master data out, slave data in | I/O |
| SPI0-MISO | SPI0 master data in, slave data out | I/O |
| SPI0-WP | Write protection and low active It also can be used for serial data input and output for SPI Quad Input or Quad Output mode. | I/O |
| SPI0-HOLD | When the device is selected and a serial sequence is underway, the HOLD pin can be used to temporarily pause the serial communication with the master device without deselecting or resetting the serial sequence. While the HOLD pin is asserted, the SO pin is at high impedance, and all transitions on the SCK pin and data on the SI pin are ignored. It also can be used for serial data input and output for SPI Quad Input or Quad Output mode. | I/O |

9.3.3.2 Clock Sources

The SPI controller gets 5 different clock sources, users can select one of them to make SPI clock source. The following table describes the clock sources for SPI. For more details on the clock setting, configuration, and gating information, see section 3.2 “CCU”.

Table 9-8 SPI Clock Sources

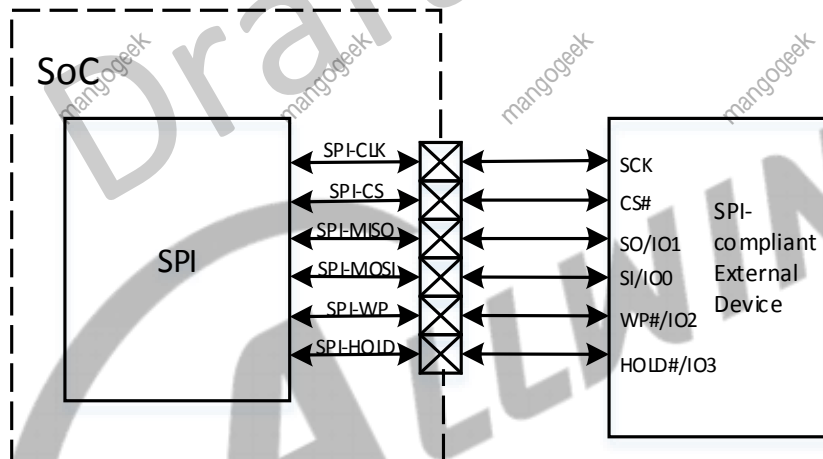

| Clock Sources | Description |
|---------------|----------------|
| HOSC | 24 MHz Crystal |

| Clock Sources | Description |
|------------------|---|
| PLL_PERI(1X) | Peripheral Clock, default value is 600 MHz |
| PLL_PERI(2X) | Peripheral Clock, default value is 1200 MHz |
| PLL_AUDIO0(DIV2) | Audio Clock, the default value is 1536 MHz |
| PLL_AUDIO0(DIV5) | Audio Clock, the default value is 614.4 MHz |

9.3.3.3 Typical Application

Figure 9-21 shows the application block diagram when the SPI master device is connected to a slave device.

Figure 9-21 SPI Application Block Diagram

9.3.3.4 SPI Transmit Format

The SPI supports 4 different formats for data transfer. The software can select one of the four modes in which the SPI works by setting the bit1 (Polarity) and bit0 (Phase) of [SPI_TCR](#). The SPI controller master uses the SPI_SCLK signal to transfer data in and out of the shift register. Data is clocked using any one of four programmable clock phase and polarity combinations.

The CPOL ([SPI_TCR\[1\]](#)) defines the polarity of the clock signal (SPI_SCLK). The SPI_SCLK is a high level when CPOL is '1' and it is a low level when CPOL is '0'. The CPHA ([SPI_TCR\[0\]](#)) decides whether the leading edge of SPI_SCLK is used to setup or sample data. The leading edge is used to setup data when CPHA is '1', and sample data when CPHA is '0'. The following table lists the four modes.

Table 9-9 SPI Transmit Format

| Mode | Polarity (CPOL) | Phase (CPHA) | Leading Edge | Trailing Edge |
|-------|-----------------|--------------|----------------------------|----------------------------|
| Mode0 | 0 | 0 | Sample on the rising edge | Setup on the falling edge |
| Mode1 | 0 | 1 | Setup on the rising edge | Sample on the falling edge |
| Mode2 | 1 | 0 | Sample on the falling edge | Setup on the rising edge |
| Mode3 | 1 | 1 | Setup on the falling edge | Sample on the rising edge |

Figure 9-22 and Figure 9-23 describe four waveforms for SPI_SCLK.

Figure 9-22 SPI Phase 0 Timing Diagram

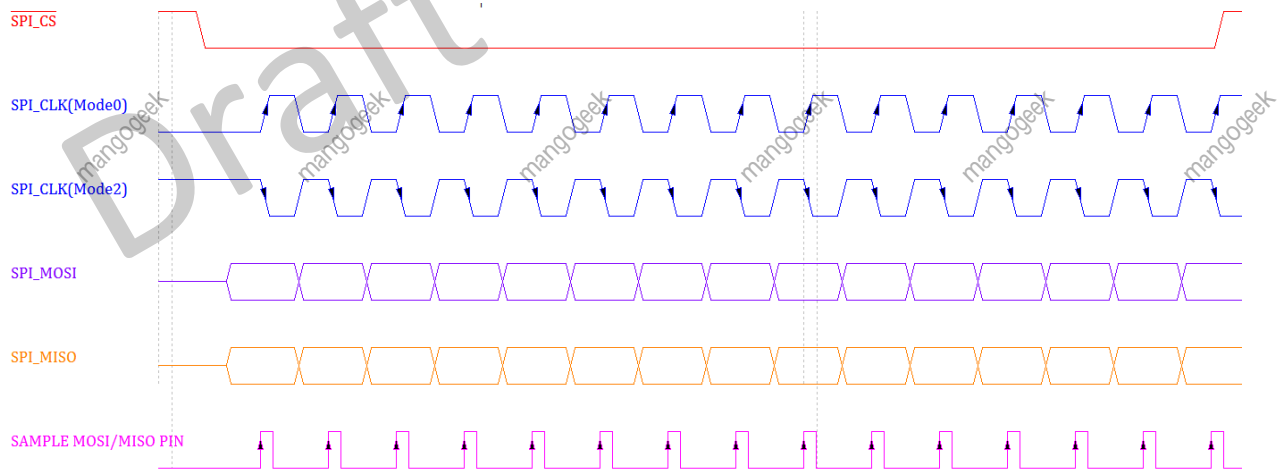

Figure 9-23 SPI Phase 1 Timing Diagram

9.3.3.5 SPI Master and Slave Mode

The SPI controller can be configured to a master or slave device. The master mode is selected by setting the MODE bit ([SPI_GCR\[1\]](#)); the slave mode is selected by clearing the MODE bit.

In master mode, the SPI_CLK is generated and transmitted to the external device, and the data from the TX FIFO is transmitted on the MOSI pin, the data from the slave device is received on the MISO pin and sent to RX FIFO. The Chip Select (SPI_SS) is an active low signal, and it must be set low before the data are transmitted or received. The SPI_SS can be selected the auto control mode or software manual control mode. When using the auto control, the SS_OWNER ([SPI_TCR\[6\]](#)) must be cleared (default value is 0); when using the manual control, the SS_OWNER must be set. And the level of SPI_SS is controlled by SS_LEVEL ([SPI_TCR\[7\]](#)).

In slave mode, after the software selects the MODE bit ([SPI_GCR\[1\]](#)) to '0', it waits for master initiate a transaction. When the master asserts SPI_SS, then SPI_CLK is transmitted to the slave device, the slave data is transmitted from TX FIFO on the MISO pin and the data from the MOSI pin is received in RX FIFO.

9.3.3.6 SPI 3-Wire Mode

The SPI 3-wire mode is only valid when the SPI controller work in master mode, and is selected when the Work Mode Select bit ([SPI_BATC\[1:0\]](#)) is equal to 0x2. And in the 3-wire mode, the input data and the output data use the same single data line. The following figure describes the 3-wire mode.

Figure 9-24 SPI 3-Wire Mode

9.3.3.7 SPI Dual-Input/Dual-Output and Dual I/O Mode

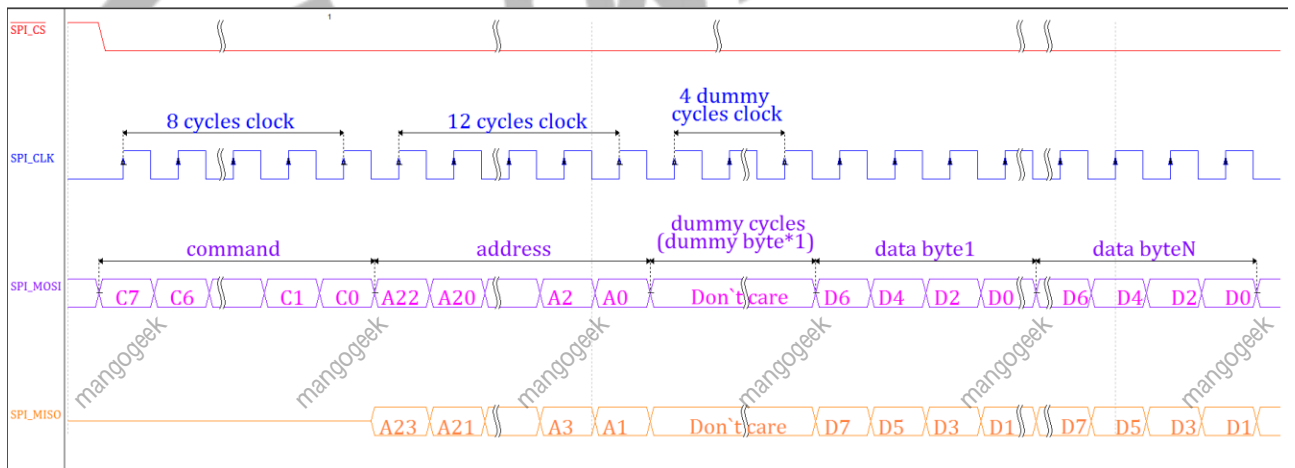

The dual read mode (SPI x2) is selected when the DRM is set in [SPI_BCC\[28\]](#). Using the dual mode allows data to be transferred to or from the device at double the rate of standard single mode, the data can be read at fast speed using two data bits (MOSI and MISO) at a time. The following figure describes the dual-input/dual-output SPI (Figure 9-25) and the dual I/O SPI (Figure 9-26).

Figure 9-25 SPI Dual-Input/Dual-Output Mode

In the dual-input/dual-output SPI mode, the command, address, and the dummy bytes output in a unit of a single bit in serial mode through the SPI_MOSI line, only the data bytes are output (write) and input (read) in a unit of dual bits through the SPI_MOSI and SPI_MISO.

Figure 9-26 SPI Dual I/O Mode

In the dual I/O SPI mode, only the command bytes output in a unit of a single bit in serial mode through the SPI_MOSI line. The address bytes and the dummy bytes output in a unit of dual bits through the SPI_MOSI and SPI_MISO. And the data bytes output (write) and input (read) in a unit of dual bits through the SPI_MOSI and SPI_MISO.

9.3.3.8 SPI Quad-Input/Quad-Output Mode

The quad read mode (SPI x4) is selected when the Quad_EN is set in [SPI_BCC\[29\]](#). Using the quad mode allows data to be transferred to or from the device at 4 times the rate of standard single mode, the data can be read at fast speed using four data bits (MOSI, MISO, IO2 (WP#) and IO3 (HOLD#)) at the same time. The following figure describes the quad-input/quad-output SPI.

Figure 9-27 SPI Quad-Input/Quad-Output Mode

In the quad-input/quad-output SPI mode, the command, address, and the dummy bytes output in a unit of a single bit in serial mode through SPI_MOSI line. Only the data bytes output (write) and input (read) in a unit of quad bits through the SPI_MOSI, SPI_MISO, SPI_WP#, and SPI_HOLD#.

9.3.3.9 Transmission/Reception Bursts in Master Mode

In SPI master mode, the transmission and reception bursts (byte in unit) are configured before the SPI transfers the serial data between the processor and external device. The transmission bursts are written in MWTC (bit[23:0]) of the [SPI Master Transmit Counter Register](#). The transmission bursts in single mode before automatically sending dummy bursts are written in STC (bit[23:0]) of the [SPI Master Transmit Counter Register](#). For dummy data, the SPI controller can automatically send before receiving by writing DBC (bit[27:24]) in the [SPI Master Transmit Counter Register](#). If users do not use the SPI controller to send dummy data automatically, then the dummy bursts are used as the transmission counters to write together in MWTC (bit[23:0]) of the [SPI Master Transmit Counter Register](#). In master mode, the total burst numbers are written in MBC (bit[23:0]) of the [SPI Master Transmit Counter Register](#). When all transmission and reception bursts are transferred, the SPI controller will send a completed interrupt, at the same time, the SPI controller will clear [DBC](#), [MWTC](#), and [MBC](#).

9.3.3.10 SPI Sample Mode and Run Clock Configuration

The SPI controller runs at 3 kHz–100 MHz at its interface to external SPI devices. The internal SPI clock should run at the same frequency as the outgoing clock in the master mode. The SPI clock is selected from different clock sources, the SPI must configure different work mode. There are three work modes: normal sample mode, delay half-cycle sample mode, delay one-cycle sample mode. The Delay half-cycle sample mode is the default mode of the SPI controller. When the SPI runs at 40 MHz or below 40 MHz, the SPI can work at normal sample mode or delay half-cycle sample mode. When the SPI runs over 80 MHz, setting the SDC bit in the [SPI Transfer Control Register](#) to ‘1’ makes the internal read sample point with a half-cycle delay of SPI_CLK, which is used in high speed read operation to reduce the error caused by the time delay of SPI_CLK between master and slave. Table 9-10 and Table 9-11 show the different configurations of the SPI sample mode.

Table 9-10 SPI Old Sample Mode and Run Clock

| SPI Sample Mode | SDM(bit13) | SDC(bit11) | Run Clock |
|-------------------------|------------|------------|-----------|
| normal sample | 1 | 0 | <=24 MHz |
| delay half cycle sample | 0 | 0 | <=40 MHz |
| delay one cycle sample | 0 | 1 | >=80 MHz |

The remaining spectrum is not recommended. Because when the output delay of SPI flash (refer to the datasheet of the manufactures for the specific delay time) is the same with the half-cycle time of SPI working clock, the variable edge of the output data for the device bumps into the clock sampling edge of the controller, so setting 1 cycle of sampling delay would cause stability problem.

Table 9-11 SPI New Sample Mode

| SPI Sample Mode | SDM (bit13) | SDC (bit11) | SDC1 (bit15) |
|-------------------------|-------------|-------------|--------------|
| normal sample | 1 | 0 | 0 |
| delay half cycle sample | 0 | 0 | 0 |
| delay one cycle sample | 0 | 1 | 0 |
| delay 1.5 cycle sample | 1 | 1 | 0 |
| delay 2 cycle sample | 1 | 0 | 1 |
| delay 2.5 cycle sample | 0 | 0 | 1 |
| delay 3 cycle sample | 0 | 1 | 1 |

9.3.3.11 SPI Error Conditions

If any error conditions occur, the hardware will set the corresponding status bits in the [SPI Interrupt Status Register](#) and stop the transfer. For the SPI controller, the following error scenarios can happen.

1. TX_FIFO Underrun

The TX_FIFO underrun happens when the CPU/DMA reads data from TX FIFO when it is empty. In the case, the SPI controller will end the transaction and flag the error bit along with the TF_UDF bit in the [SPI Interrupt Status Register](#). The SPI controller will generate an interrupt if interrupts are enabled. The software has to clear the error bit and the TF_UDF bit. To start a new transaction, the software has to reset the FIFO by writing to the SRST (soft reset) bit in the [SPI Global Control Register](#).

2. TX_FIFO Overflow

The TX_FIFO overflow happens when the CPU/DMA writes data into the TX FIFO when it is full. In the case, the SPI controller will end the transaction and flag the error bit along with the TF_OVF bit in the [SPI Interrupt Status Register](#). The SPI controller will generate an interrupt if interrupts are enabled. The software has to clear the error bit and the TF_OVF bit. To start a new transaction, the software has to reset the FIFO by writing to the SRST (soft reset) bit in the [SPI Global Control Register](#).

3. RX_FIFO Underrun

The RX_FIFO underrun happens when the CPU/DMA reads data from RX FIFO when it is empty. In the case, the SPI controller will end the transaction and flag the error bit along with the RF_UDF bit in the [SPI Interrupt Status Register](#). The SPI controller will generate an interrupt if interrupts are enabled. The software has to clear the error bit and the RF_UDF bit. To start a new transaction, the software has to reset the fifo by writing to the SRST (soft reset) bit in the [SPI Global Control Register](#).

4. RX_FIFO Overflow

The RX_FIFO overflow happens when the CPU/DMA writes data into the RX FIFO when it is full. In the case, the SPI controller will end the transaction and flag the error bit along with the RF_OVF bit in the [SPI Interrupt Status Register](#). The SPI controller will generate an interrupt if interrupts are enabled. The software has to clear the error bit and the RF_OVF bit. To start a new transaction, the software has to reset the FIFO by writing to the SRST (soft reset) bit in the [SPI Global Control Register](#).

9.3.4 Programming Guidelines

9.3.4.1 Writing/Reading Data Process

The SPI transfers serial data between the processor and the external device. The CPU mode and DMA mode are the two main operational modes for SPI. For each SPI, the data is simultaneously transmitted (shifted out serially) and received (shifted in serially). The SPI has 2 channels, including the TX channel and RX channel. The TX channel has the path from TX FIFO to the external device. The RX channel has the path from the external device to RX FIFO.

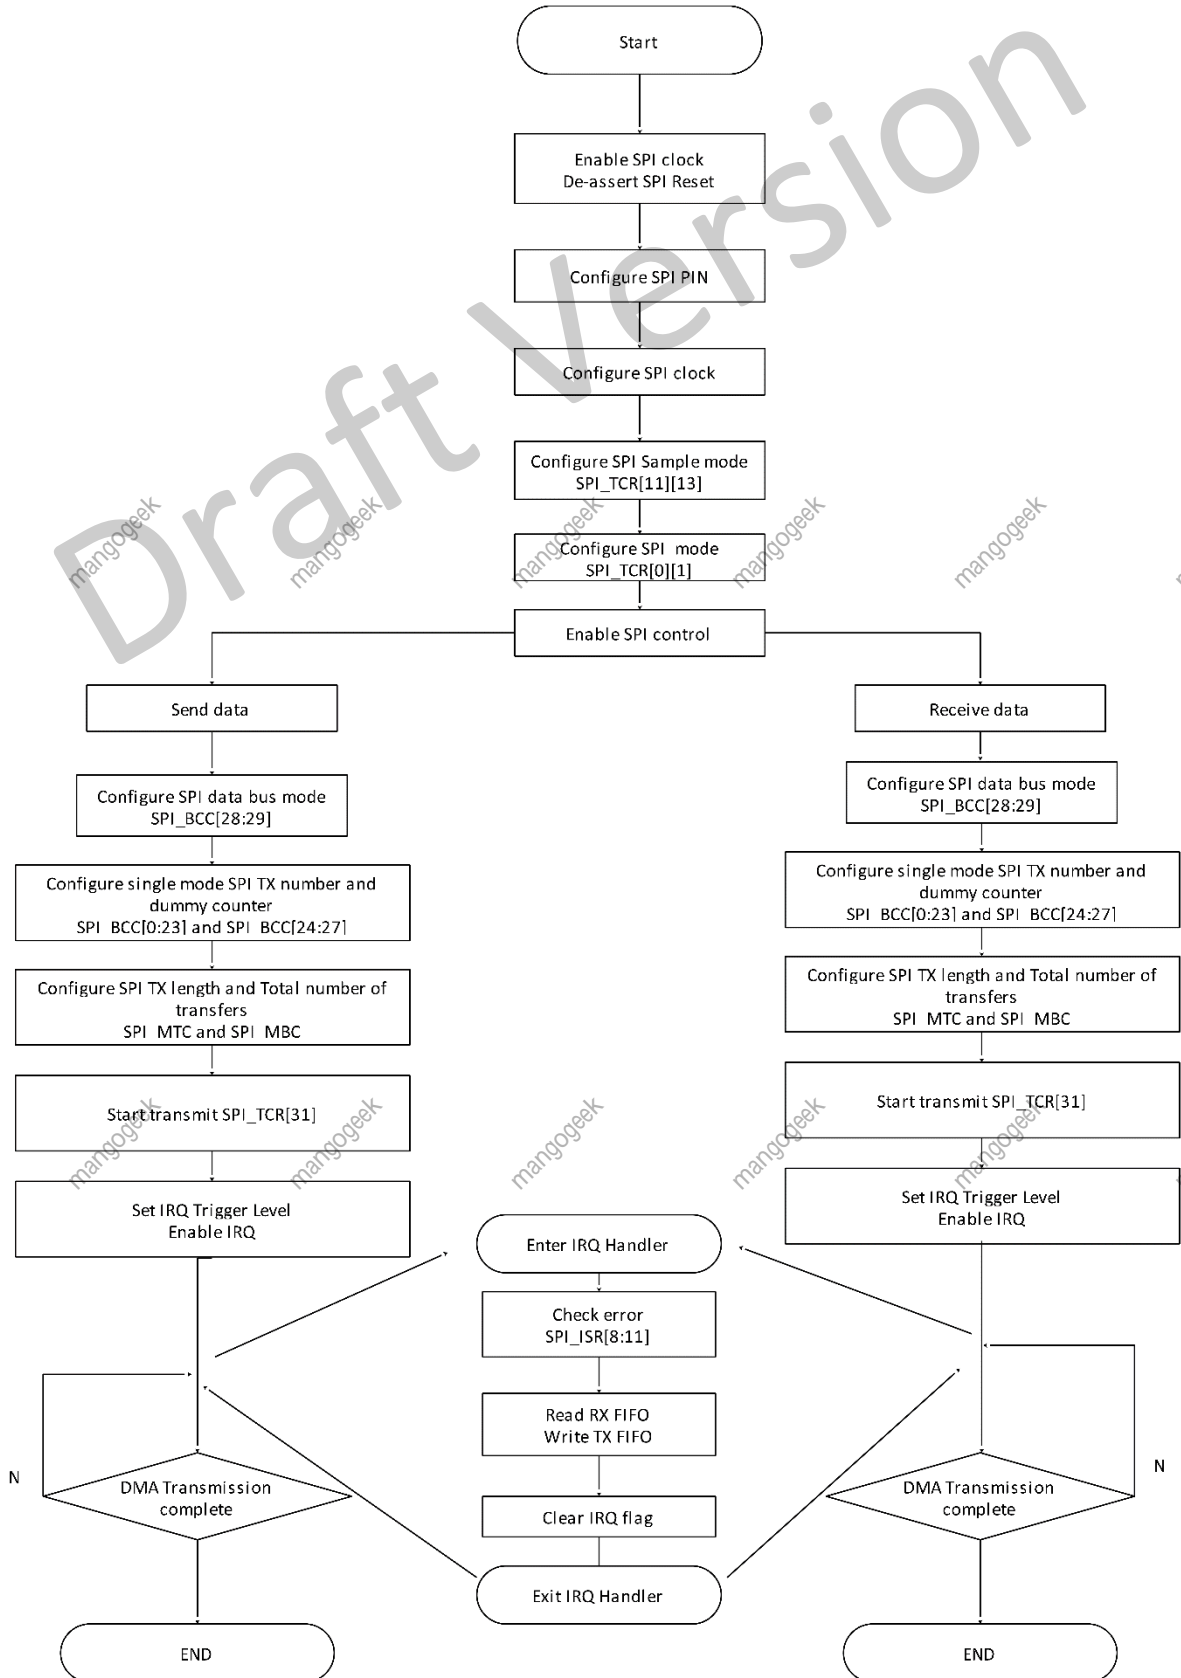

Write Data: The CPU or DMA must write data on the [SPI_TXD](#) register, the data on the register are automatically moved to TX FIFO.

Read Data: To read data from RX FIFO, the CPU or DMA must access the [SPI_RXD](#) register and the data are automatically sent to the [SPI_RXD](#) register.

In CPU or DMA mode, the SPI sends a completed interrupt ([SPI_ISR\[TC\]](#)) to the processor after each transmission is complete.

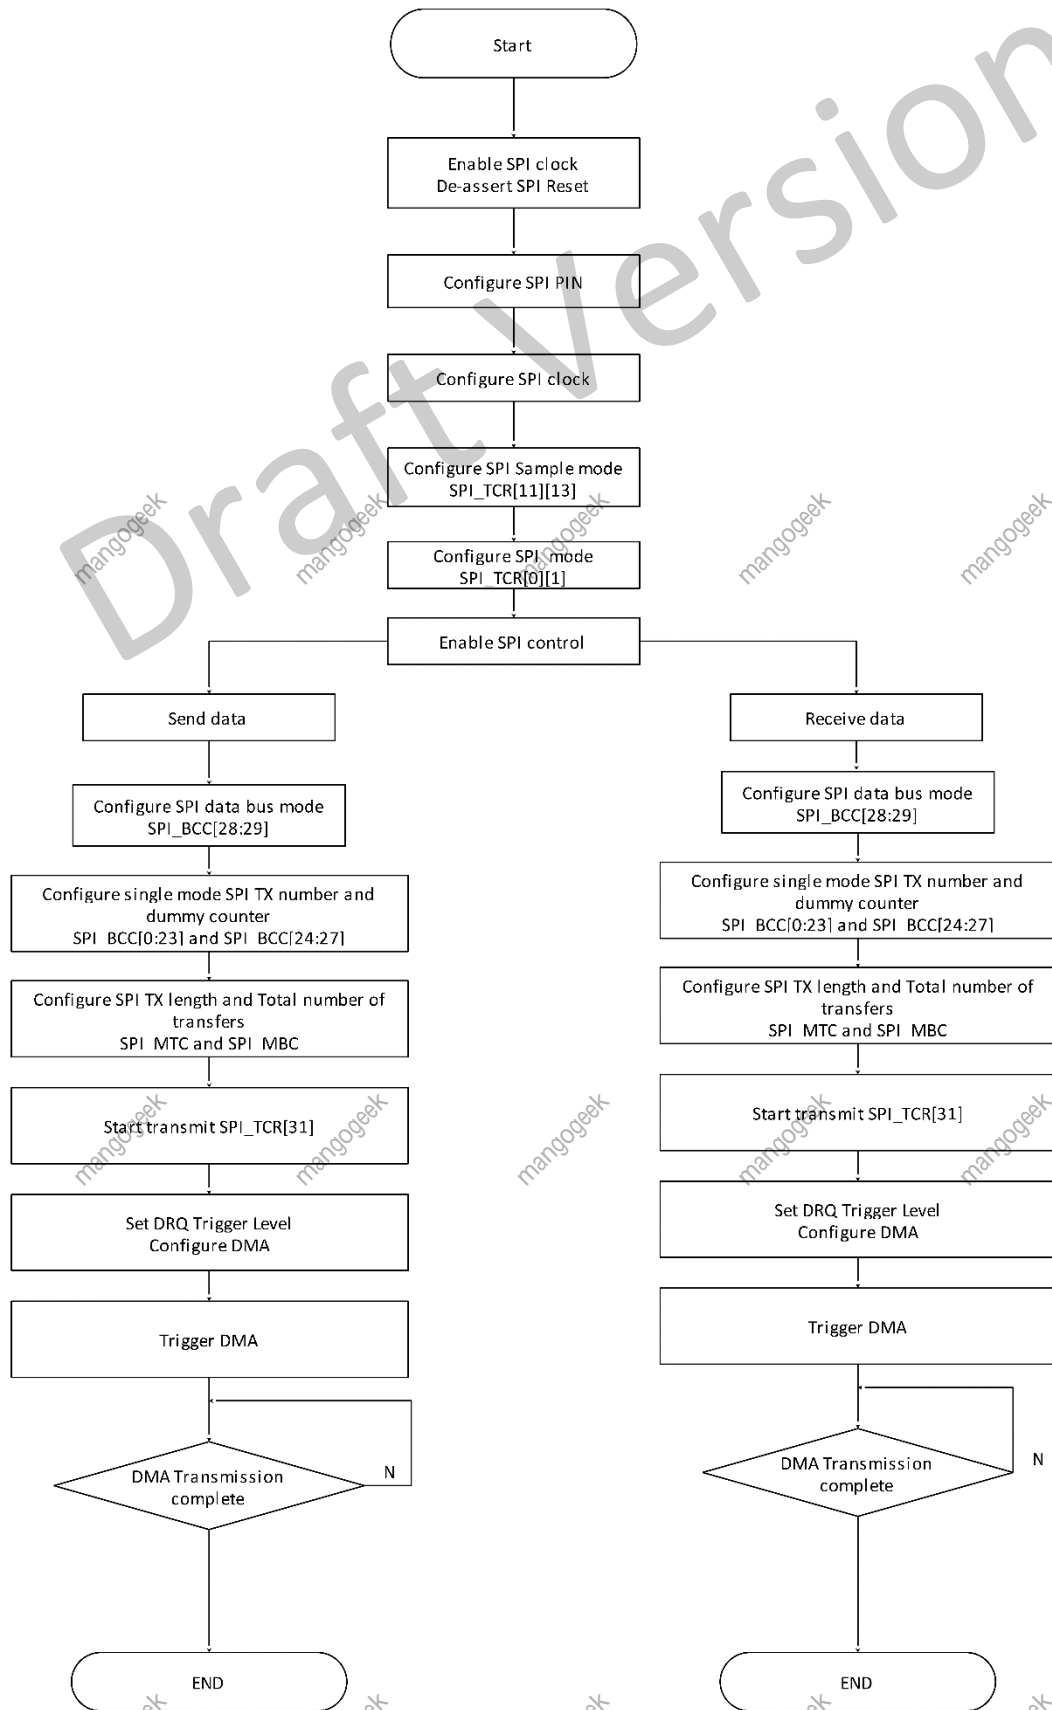

CPU Mode

Figure 9-28 SPI Write/Read Data in CPU Mode

DMA Mode

Figure 9-29 SPI Write/Read Data in DMA Mode

9.3.4.2 Calibrate Delay Chain

The SPI has one delay chain which is used to generate delay to make proper timing between the internal SPI clock signal and data signals. Delay chain is made up of 64 delay cells. The delay time of one delay cell can be estimated through delay chain calibration.

The steps to calibrate delay chain are as follows:

- Step 1** Enable SPI. To calibrate the delay chain by the operation registers in SPI, the SPI must be enabled through AHB reset and AHB clock gating control registers.
- Step 2** Configure a proper clock for SPI. The calibration delay chain is based on the clock for SPI from CCU.
- Step 3** Set proper initial delay value. Write 0xA0 to the [SPI Sample Delay Control Register](#) to set initial delay value 0x20 to delay chain. Then write 0x0 to the [SPI Sample Delay Control Register](#) to clear this value.
- Step 4** Write 0x8000 to the [SPI Sample Delay Control Register](#) to start to calibrate the delay chain.
- Step 5** Wait until the flag (bit14 in the [SPI Sample Delay Control Register](#)) of calibration done is set. The number of delay cells is shown at the bit[13:8] of the [SPI Sample Delay Control Register](#). The delay time generated by these delay cells is equal to the cycle of the SPI clock nearly. This value is the result of calibration.
- Step 6** Calculate the delay time of one delay cell according to the cycle of the SPI clock and the result of calibration.

9.3.5 Register List

| Module Name | Base Address |
|-------------|--------------|
| SPIO | 0x04025000 |

| Register Name | Offset | Description |
|---------------|--------|-----------------------------------|
| SPI_GCR | 0x0004 | SPI Global Control Register |
| SPI_TCR | 0x0008 | SPI Transfer Control Register |
| SPI_IER | 0x0010 | SPI Interrupt Control Register |
| SPI_ISR | 0x0014 | SPI Interrupt Status Register |
| SPI_FCR | 0x0018 | SPI FIFO Control Register |
| SPI_FSR | 0x001C | SPI FIFO Status Register |
| SPI_WCR | 0x0020 | SPI Wait Clock Register |
| SPI_SAMP_DL | 0x0028 | SPI Sample Delay Control Register |
| SPI_MBC | 0x0030 | SPI Master Burst Counter Register |

| Register Name | Offset | Description |
|-------------------|--------|--|
| SPI_MTC | 0x0034 | SPI Master Transmit Counter Register |
| SPI_BCC | 0x0038 | SPI Master Burst Control Register |
| SPI_BATCR | 0x0040 | SPI Bit-Aligned Transfer Configure Register |
| SPI_BA_CCR | 0x0044 | SPI Bit-Aligned Clock Configuration Register |
| SPI_TBR | 0x0048 | SPI TX Bit Register |
| SPI_RBR | 0x004C | SPI RX Bit Register |
| SPI_NDMA_MODE_CTL | 0x0088 | SPI Normal DMA Mode Control Register |
| SPI_TXD | 0x0200 | SPI TX Data Register |
| SPI_RXD | 0x0300 | SPI RX Data Register |

9.3.6 Register Description

9.3.6.1 0x0004 SPI Global Control Register (Default Value: 0x0000_0080)

| Offset:0x0004 | | | Register Name: SPI_GCR |
|---------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R/WAC | 0x0 | SRST Soft reset Writing '1' to this bit will clear the SPI controller, and auto clear to '0' when reset operation completes. Writing '0' to this bit has no effect. |
| 30:8 | / | / | / |
| 7 | R/W | 0x1 | TP_EN Transmit Pause Enable In master mode, it is used to control the transmit state machine to stop smart burst sending when RX FIFO is full. 0: Normal operation, ignore RXFIFO status 1: Stop transmit data when RXFIFO full Cannot be written when XCH=1. |
| 6:3 | / | / | / |
| 2 | R/W | 0x0 | MODE_SELEC Sample Timing Mode Select 0: Old mode of Sample Timing 1: New mode of Sample Timing Cannot be written when XCH=1. |

| Offset:0x0004 | | | Register Name: SPI_GCR |
|---------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 1 | R/W | 0x0 | <p>MODE</p> <p>SPI Function Mode Select</p> <p>0: Slave mode</p> <p>1: Master mode</p> <p>Cannot be written when XCH=1.</p> |
| 0 | R/W | 0x0 | <p>EN</p> <p>SPI Module Enable Control</p> <p>0: Disable</p> <p>1: Enable</p> <p>After transforming from bit_mode to byte_mode, it must enable the SPI module again.</p> |

9.3.6.2 0x0008 SPI Transfer Control Register (Default Value: 0x0000_0087)

| Offset: 0x0008 | | | Register Name: SPI_TCR |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R/WAC | 0x0 | <p>XCH</p> <p>Exchange Burst</p> <p>In master mode, it is used to start SPI burst.</p> <p>0: Idle</p> <p>1: Initiates exchange.</p> <p>Writing "1" to this bit will start the SPI burst, and will auto-clear after finishing the bursts transfer specified by SPI_MBC. Writing "1" to SRST(SPI_GCR[31]) will also clear this bit. Writing '0' to this bit has no effect.</p> <p>Cannot be written when XCH=1.</p> |
| 30:16 | / | / | / |
| 15 | R/W | 0x0 | <p>SDC1</p> <p>Master Sample Data Control register1</p> <p>Set this bit to '1' to make the internal read sample point with a delay of half-cycle of SPI_CLK. It is used in high speed read operation to reduce the error caused by the time delay of SPI_CLK between master and slave.</p> <p>0: normal operation, do not delay the internal read sample point</p> <p>1: delay the internal read sample point</p> <p>Cannot be written when XCH=1.</p> |

| Offset: 0x0008 | | | Register Name: SPI_TCR |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 14 | R/W | 0x0 | <p>SDDM Sending Data Delay Mode</p> <p>0: Normal sending 1: Delay sending</p> <p>Set the bit to "1" to make the data that should be sent with a delay of half-cycle for SPI_CLK in dual IO mode of SPI mode0.</p> <p>Cannot be written when XCH=1.</p> |
| 13 | R/W | 0x0 | <p>SDM Master Sample Data Mode</p> <p>0: Delay sample mode 1: Normal sample mode</p> <p>In normal sample mode, the SPI master samples the data at the correct edge for each SPI mode;</p> <p>In delay sample mode, the SPI master samples data at the edge that is half cycle delayed by the correct edge defined in respective SPI mode.</p> <p>Cannot be written when XCH=1.</p> |
| 12 | R/W | 0x0 | <p>FBS First Transmit Bit Select</p> <p>0: MSB first 1: LSB first</p> <p>Cannot be written when XCH=1.</p> |
| 11 | R/W | 0x0 | <p>SDC Master Sample Data Control</p> <p>Set this bit to '1' to make the internal read sample point with a delay of half-cycle for SPI_CLK. It is used in high speed read operation to reduce the error caused by the time delay of SPI_CLK between master and slave.</p> <p>0: Normal operation, do not delay the internal read sample point 1: Delay the internal read sample point</p> <p>Cannot be written when XCH=1.</p> |
| 10 | R/W | 0x0 | <p>RPSM Rapids Mode Select</p> <p>Select rapid mode for high speed write.</p> <p>0: Normal write mode 1: Rapid write mode</p> <p>Cannot be written when XCH=1.</p> |

| Offset: 0x0008 | | | Register Name: SPI_TCR |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 9 | R/W | 0x0 | <p>DDB Dummy Burst Type</p> <p>0: The bit value of dummy SPI burst is zero 1: The bit value of dummy SPI burst is one</p> <p>Cannot be written when XCH=1.</p> |
| 8 | R/W | 0x0 | <p>DHB Discard Hash Burst</p> <p>In master mode, it controls whether discarding unused SPI bursts</p> <p>0: Receiving all SPI bursts in the BC period 1: Discard unused SPI bursts, only fetching the SPI bursts during the dummy burst period. The burst number is specified by TC.</p> <p>Cannot be written when XCH=1.</p> |
| 7 | R/W | 0x1 | <p>SS_LEVEL</p> <p>When control SS signal manually (SS_OWNER (SPI_TCR[6])==1), set this bit to '1' or '0' to control the level of SS signal.</p> <p>0: Set SS to low 1: Set SS to high</p> <p>Cannot be written when XCH=1.</p> |
| 6 | R/W | 0x0 | <p>SS_OWNER SS Output Owner Select</p> <p>Usually, the controller sends the SS signal automatically with data together. When this bit is set to 1, the software must manually write SS_LEVEL (SPI_TCR[7]) to 1 or 0 to control the level of the SS signal.</p> <p>0: SPI controller 1: Software</p> <p>Cannot be written when XCH=1.</p> |
| 5:4 | R/W | 0x0 | <p>SS_SEL SPI Chip Select</p> <p>Select one of four external SPI Master/Slave Devices</p> <p>00: SPI_SS0 will be asserted 01: SPI_SS1 will be asserted 10: SPI_SS2 will be asserted 11: SPI_SS3 will be asserted</p> <p>Cannot be written when XCH=1.</p> |

| Offset: 0x0008 | | | Register Name: SPI_TCR |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 3 | R/W | 0x0 | <p>SSCTL</p> <p>In master mode, this bit selects the output waveform for the SPI_SSx signal. Only valid when SS_OWNER (SPI_TCR[6])= 0.</p> <p>0: SPI_SSx remains asserted between SPI bursts</p> <p>1: Negate SPI_SSx between SPI bursts</p> <p>Cannot be written when XCH=1.</p> |
| 2 | R/W | 0x1 | <p>SPOL</p> <p>SPI Chip Select Signal Polarity Control</p> <p>0: Active high polarity (0 = Idle)</p> <p>1: Active low polarity (1 = Idle)</p> <p>Cannot be written when XCH=1.</p> |
| 1 | R/W | 0x1 | <p>CPOL</p> <p>SPI Clock Polarity Control</p> <p>0: Active high polarity (0 = Idle)</p> <p>1: Active low polarity (1 = Idle)</p> <p>Cannot be written when XCH=1.</p> |
| 0 | R/W | 0x1 | <p>CPHA</p> <p>SPI Clock/Data Phase Control</p> <p>0: Phase 0 (Leading edge for sample data)</p> <p>1: Phase 1 (Leading edge for setup data)</p> <p>Cannot be written when XCH=1.</p> |

9.3.6.3 0x0010 SPI Interrupt Control Register (Default Value: 0x0000_0000)

| Offset: 0x0010 | | | Register Name: SPI_IER |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:14 | / | / | / |
| 13 | R/W | 0x0 | <p>SS_INT_EN</p> <p>SSI Interrupt Enable</p> <p>Chip select signal (SSx) from the valid state to the invalid state</p> <p>0: Disable</p> <p>1: Enable</p> |

| Offset: 0x0010 | | | Register Name: SPI_IER |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 12 | R/W | 0x0 | TC_INT_EN Transfer Completed Interrupt Enable 0: Disable 1: Enable |
| 11 | R/W | 0x0 | TF_UDR_INT_EN TXFIFO Underrun Interrupt Enable 0: Disable 1: Enable |
| 10 | R/W | 0x0 | TF_OVF_INT_EN TX FIFO Overflow Interrupt Enable 0: Disable 1: Enable |
| 9 | R/W | 0x0 | RF_UDR_INT_EN RXFIFO Underrun Interrupt Enable 0: Disable 1: Enable |
| 8 | R/W | 0x0 | RF_OVF_INT_EN RX FIFO Overflow Interrupt Enable 0: Disable 1: Enable |
| 7 | / | / | / |
| 6 | R/W | 0x0 | TF_FUL_INT_EN TX FIFO Full Interrupt Enable 0: Disable 1: Enable |
| 5 | R/W | 0x0 | TX_EMP_INT_EN TX FIFO Empty Interrupt Enable 0: Disable 1: Enable |
| 4 | R/W | 0x0 | TX_ERQ_INT_EN TX FIFO Empty Request Interrupt Enable 0: Disable 1: Enable |
| 3 | / | / | / |

| Offset: 0x0010 | | | Register Name: SPI_IER |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 2 | R/W | 0x0 | RF_FUL_INT_EN RX FIFO Full Interrupt Enable 0: Disable 1: Enable |
| 1 | R/W | 0x0 | RX_EMP_INT_EN RX FIFO Empty Interrupt Enable 0: Disable 1: Enable |
| 0 | R/W | 0x0 | RF_RDY_INT_EN RX FIFO Ready Request Interrupt Enable 0: Disable 1: Enable |

9.3.6.4 0x0014 SPI Interrupt Status Register (Default Value: 0x0000_0032)

| Offset: 0x0014 | | | Register Name: SPI_ISR |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:14 | / | / | / |
| 13 | R/W1C | 0x0 | SSI SS Invalid Interrupt When SSI is 1, it indicates that SPI_SS has changed from valid state to invalid state. Writing 1 to this bit clears it. |
| 12 | R/W1C | 0x0 | TC Transfer Completed In master mode, it indicates that all bursts specified by SPI_MBC have been exchanged. In other conditions, when setting, this bit indicates that all the data in TXFIFO has been loaded in the Shift register, and the Shift register has shifted out all the bits. Writing 1 to this bit clears it. 0: Busy 1: Transfer completed |

In the half-word accessing method, two SPI bursts are returned and the RXFIFO depth is decreased by 2. In the word accessing method, the four SPI bursts are returned and the RXFIFO depth is decreased by 4.</p> <p>Note: This address is readable-only if RF_TEST is '0', and if RF_TEST is set to '1', this address is readable and writable to test the RXFIFO through the AHB bus.</p> |

9.4 SPI_DBI

9.4.1 Overview

The D1 provides a 3/4 line SPI display bus interface (SPI_DBI) for video data transmission. It supports DBI mode or SPI mode. The DBI mode is compatible with multiple video data formats at the same time. The SPI mode is used for low-cost display schemes.

The SPI mode has the following features:

- Full-duplex synchronous serial interface
- Master/slave configurable
- 8-bit wide by 64-entry FIFO for both transmit and receive data
- Polarity and phase of the Chip Select (SPI_SS) and SPI Clock (SPI_SCLK) are configurable
- Supports interrupts and DMA
- Supports mode0, mode1, mode2, and mode3
- Supports 3-wire/4-wire SPI
- Supports programmable serial data frame length: 1 bit to 32 bits
- Supports standard SPI, dual-output/dual-input SPI, dual I/O SPI, quad-output/quad-input SPI
- Supports maximum IO rate of the mass production: 100 MHz

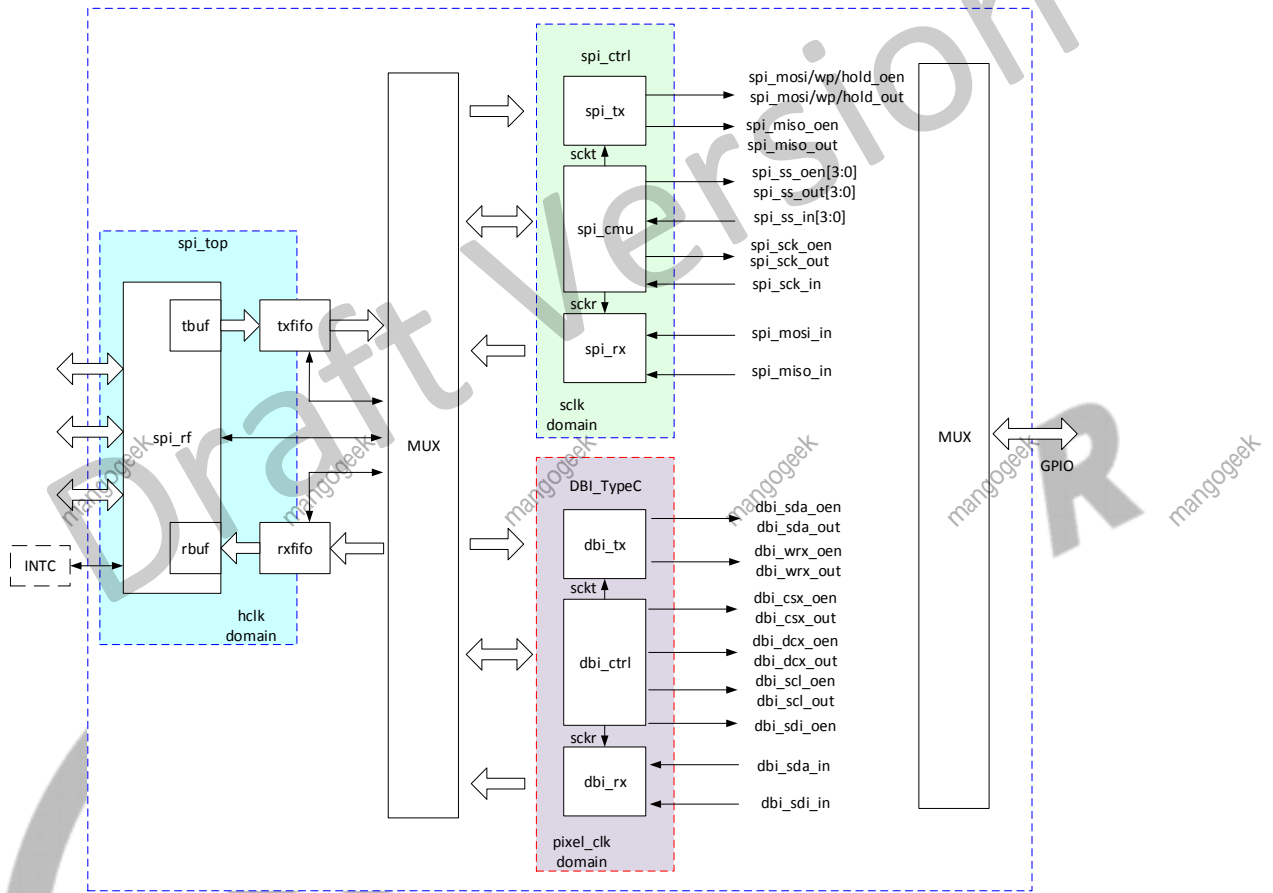

The DBI mode has the following features:

- Supports DBI Type C 3-Line/4 Line Interface Mode
- Supports 2 Data Lane Interface Mode
- Supports data source from CPU or DMA
- Supports RGB111/444/565/666/888 video format
- Maximum resolution of RGB666 240 x 320@30Hz with single data lane
- Maximum resolution of RGB888 240 x 320@60Hz or 320 x 480@30Hz with dual data lane
- Supports Tearing effect
- Supports software flexible control video frame rate

9.4.2 Block Diagram

Figure 9-30 shows a block diagram of the SPI_DBI.

Figure 9-30 SPI_DBI Block Diagram

SPI_DBI contains the following sub-blocks:

Table 9-12 SPI_DBI Sub-blocks

| Sub-block | Description |
|----------------|---|
| spi_rf | Responsible for implementing the internal register, interrupt, and DMA Request. |
| spi_tbuf | The data length transmitted from AHB to TXFIFO is converted into 8 bits, then the data is written into the RXFIFO. |
| spi_rbuf | The block is used to convert the RXFIFO data into the reading data length of AHB. |
| txfifo, rxfifo | The data transmitted from the SPI to the external serial device is written into the TXFIFO; the data received from the external serial device into SPI is pushed into the RXFIFO. |
| spi_cmu | Responsible for implementing SPI bus clock, chip select, internal sample, and the generation of transfer clock. |

| Sub-block | Description |
|-----------|--|
| spi_tx | Responsible for implementing SPI data transfer, the interface of the internal TXFIFO, and status register. |
| spi_rx | Responsible for implementing SPI data receive, the interface of the internal RXFIFO, and status register. |
| dbi_ctrl | Responsible for implementing DBI bus clock, chip select, data command select, RGB format reshape. |
| dbi_tx | Responsible for implementing DBI data transfer, the interface of the internal TXFIFO, and status register. |
| dbi_rx | Responsible for implementing DBI data receive, the interface of the internal RXFIFO, and status register. |

9.4.3 Functional Description

9.4.3.1 External Signals

The following table describes the external signals of SPI_DBI. When using SPI_DBI, the corresponding PADs are selected as SPI_DBI function via section 9.7 “[GPIO](#)”.

Table 9-13 SPI_DBI External Signals

| External Signal | Description | Type | |
|-----------------|--|---|-----|
| DBI Mode | DBI-CSX | Chip select signal, low active | I/O |
| | DBI-SCLK | Serial clock signal | I/O |
| | DBI-SDO | Data output signal | I/O |
| | DBI-SDI | Data input signal, the data is sampled on the rising edge and the falling edge | I/O |
| | DBI-TE | Tearing effect input, it is used to capture the external TE signal edge. | I/O |
| | DBI-DCX | DCX pin is the select output signal of data and command. DCX = 0: register command; DCX = 1: data or parameter. | I/O |
| | DBI-WRX | When DBI operates in dual data lane format, the RGB666 format 2 can use WRX to transfer data | I/O |
| SPI Mode | SPI1-CS When the device is not selected, data will not be accepted via the SI pin, and the SO pin will stop transmission. | I/O | |

| External Signal | Description | Type |
|-----------------|--|------|
| SPI1-CLK | SPI1 clock signal This pin is used to provide a clock to the device and is used to control the flow of data to and from the device. | I/O |
| SPI1-MOSI | SPI1 master data out, slave data in | I/O |
| SPI1-MISO | SPI1 master data in, slave data out | I/O |
| SPI1-WP | Write protection and active low It also can be used for serial data input and output for SPI Quad Input or Quad Output mode. | I/O |
| SPI1-HOLD | When the device is selected and a serial sequence is underway, the HOLD pin is can be used to temporarily pause the serial communication with the master device without deselecting or resetting the device serial sequence. While the HOLD pin is asserted, the SO pin is at high impedance, and all transitions on the SCK pin and data on the SI pin are ignored. It also can be used for serial data input and output for SPI Quad Input or Quad Output mode. | I/O |

9.4.3.2 Clock Sources

The SPI_DBI controller gets 5 different clock sources, users can select one of them to make SPI_DBI clock source. The following table describes the clock sources for SPI_DBI. For more details on the clock setting, configuration, and gating information, see section 3.2 “CCU”.

Table 9-14 SPI_DBI Clock Sources

| Clock Sources | Description |
|------------------|---|
| HOSC | 24 MHz Crystal |
| PLL_PERI(1X) | Peripheral Clock, the default value is 600 MHz |
| PLL_PERI(2X) | Peripheral Clock, the default value is 1200 MHz |
| PLL_AUDIO0(DIV2) | Audio Clock, the default value is 1536 MHz |
| PLL_AUDIO0(DIV5) | Audio Clock, the default value is 614.4 MHz |

9.4.3.3 Typical Application

Figure 9-31 shows the application block diagram when the SPI master device is connected to a slave device.

Figure 9-31 SPI Application Block Diagram

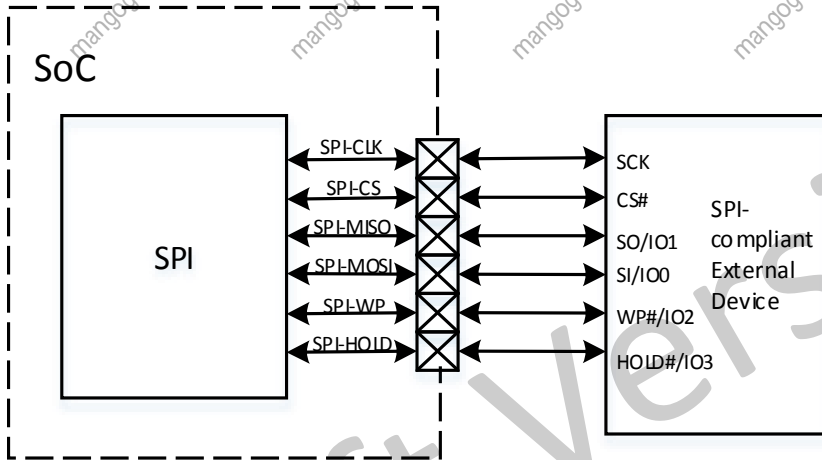

Figure 9-32 shows the application block diagram when the DBI master device is connected to a display bus interface device.

Figure 9-32 DBI Application Block Diagram

9.4.3.4 SPI Transmission Format

The SPI supports 4 different formats for data transmission. The software can select one of the four modes in which the SPI works by setting the bit1 (Polarity) and bit0 (Phase) of [SPI_TCR](#). The SPI controller master uses the SPI_SCLK signal to transfer data in and out of the shift register. Data is clocked using any one of four programmable clock phase and polarity combinations.

The CPOL ([SPI_TCR\[1\]](#)) defines the polarity of the clock signal (SPI_SCLK). The SPI_SCLK is a high level when CPOL is '1' and it is a low level when CPOL is '0'. The CPHA ([SPI_TCR\[0\]](#)) decides whether the leading edge of

SPI_SCLK is used to setup or sample data. The leading edge is used to setup data when CPHA is '1', and sample data when CPHA is '0'. The following table lists the four modes.

Table 9-15 SPI Transmit Format

| SPI Mode | Polarity (CPOL) | Phase (CPHA) | Leading Edge | Trailing Edge |
|----------|-----------------|--------------|----------------------------|----------------------------|
| mode0 | 0 | 0 | Sample on the rising edge | Setup on the falling edge |
| mode1 | 0 | 1 | Setup on the rising edge | Sample on the falling edge |
| mode2 | 1 | 0 | Sample on the falling edge | Setup on the rising edge |
| mode3 | 1 | 1 | Setup on the falling edge | Sample on the rising edge |

Figure 9-33 and Figure 9-34 describe four waveforms for SPI_SCLK.

Figure 9-33 SPI Phase 0 Timing Diagram

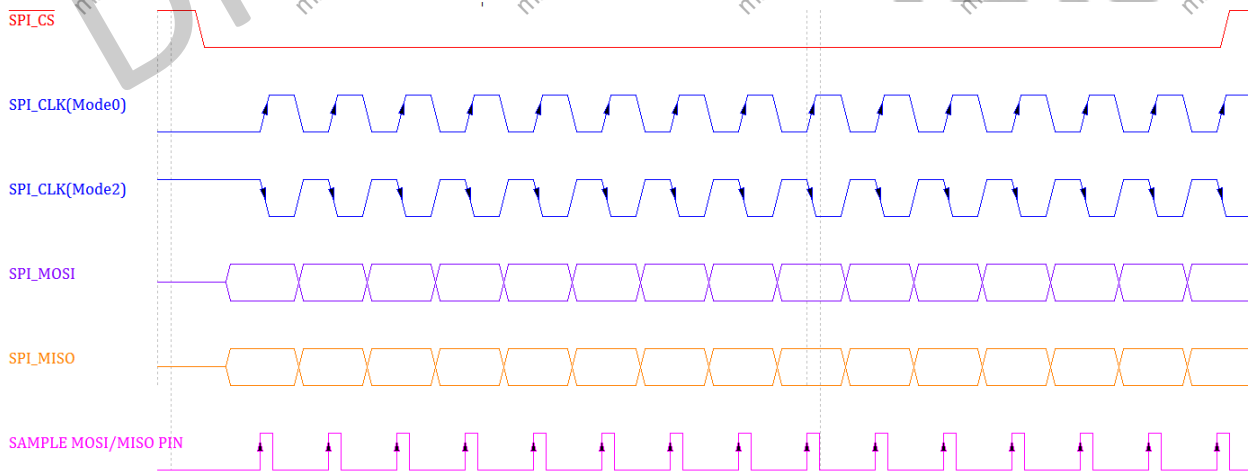

Figure 9-34 SPI Phase 1 Timing Diagram

9.4.3.5 SPI Master and Slave Mode

The SPI controller can be configured to a master or slave device. The master mode is selected by setting the MODE bit ([SPI_GCR\[1\]](#)); the slave mode is selected by clearing the MODE bit.

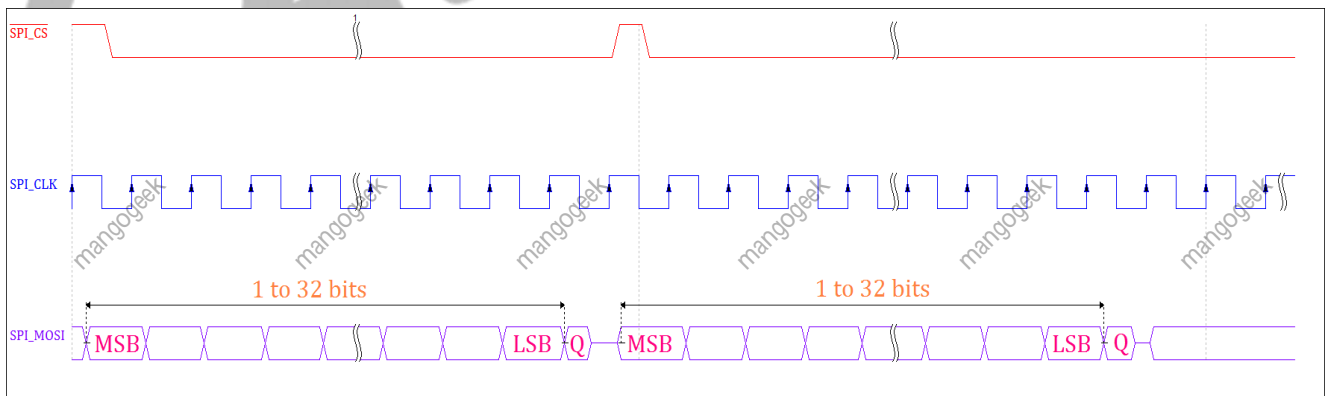

In master mode, the SPI_CLK is generated and transmitted to the external device, and the data from the TX FIFO is transmitted on the MOSI pin, the data from the slave is received on the MISO pin and sent to RX FIFO. The Chip Select (SPI_SS) is an active low signal, and it must be set low before the data are transmitted or received. The SPI_SS can be selected the auto control mode or the software manual control mode. When using auto control, the SS_OWNER ([SPI_TCR\[6\]](#)) must be cleared (default value is 0); when using manual control, the SS_OWNER must be set. And the level of SPI_SS is controlled by SS_LEVEL ([SPI_TCR\[7\]](#)).

In slave mode, after the software selects the MODE bit ([SPI_GCR\[1\]](#)) to '0', it waits for master initiate a transaction. When the master asserts SPI_SS, and SPI_CLK is transmitted to the slave, the slave data is transmitted from TX FIFO on the MISO pin, and the data from the MOSI pin is received in RX FIFO.

9.4.3.6 SPI 3-Wire Mode

The SPI 3-wire mode is only valid when the SPI controller work in master mode, and is selected when the Work Mode Select bit ([SPI_BATC\[1:0\]](#)) is equal to 0x2. And in the 3-wire mode, the input data and the output data use the same single data line. The following figure describes the 3-wire mode.

Figure 9-35 SPI 3-Wire Mode

9.4.3.7 SPI Dual-Input/Dual-Output and Dual I/O Mode

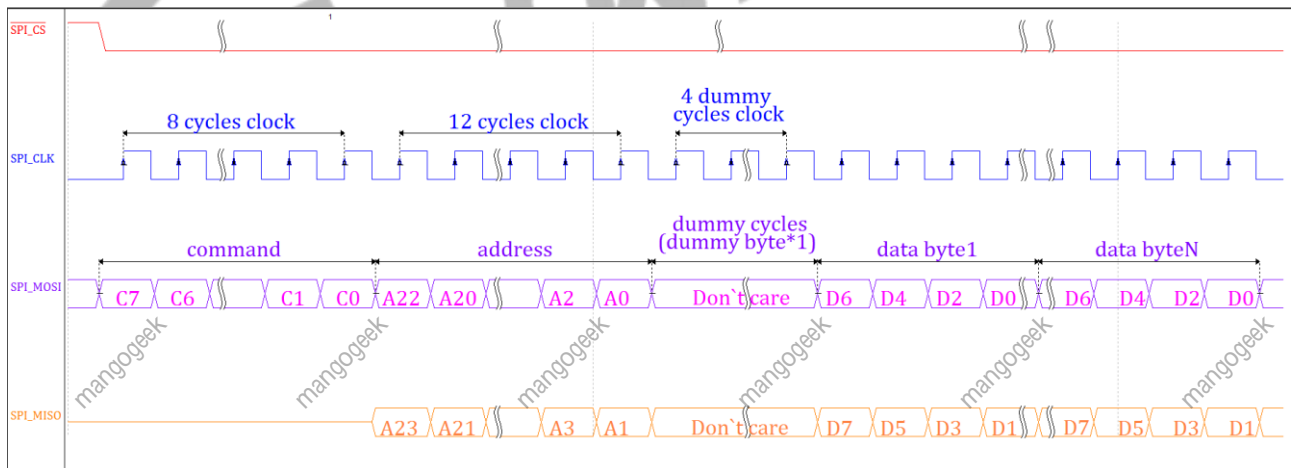

The dual read mode (SPI x2) is selected when the DRM is set in [SPI_BCC\[28\]](#). Using the dual mode allows data to be transferred to or from the device at double the rate of standard single mode SPI devices, the data can be read at fast speed using two data bits (MOSI and MISO) at a time. The following figure describes the dual-input/dual-output SPI (Figure 9-36) and the dual I/O SPI (Figure 9-37).

Figure 9-36 SPI Dual-Input/Dual-Output Mode

In the dual-input/dual-output SPI mode, the command, address, and the dummy bytes output in a unit of a single bit in serial mode through the SPI_MOSI line, only the data bytes are output (write) and input (read) in a unit of dual bits through the SPI_MOSI and SPI_MISO.

Figure 9-37 SPI Dual I/O Mode

In the dual I/O SPI mode, only the command bytes output in a unit of a single bit in serial mode through the SPI_MOSI line. The address bytes and the dummy bytes output in a unit of dual bits through the SPI_MOSI and SPI_MISO. And the data bytes output (write) and input (read) in a unit of dual bits through the SPI_MOSI and SPI_MISO.

9.4.3.8 SPI Quad-Input/Quad-Output Mode

The quad read mode (SPI x4) is selected when the Quad_EN is set in [SPI_BCC\[29\]](#). Using the quad mode allows data to be transferred to or from the device at 4 times the rate of standard single mode SPI devices, the data can be read at fast speed using four data bits (MOSI, MISO, IO2 (WP#) and IO3 (HOLD#)) at the same time. The following figure describes the quad-input/quad-output SPI.

Figure 9-38 SPI Quad-Input/Quad-Output Mode

In the quad-input/quad-output SPI mode, the command, address, and the dummy bytes output in a unit of a single bit in serial mode through the SPI_MOSI line. Only the data bytes output (write) and input (read) in a unit of quad bits through the SPI_MOSI, SPI_MISO, SPI_WP#, and SPI_HOLD#.

9.4.3.9 Transmission/Reception Bursts in Master Mode

In SPI master mode, the transmission and reception bursts (byte in unit) are configured before the SPI transfers serial data between the processor and external device. The transmission bursts are written in MWTC (bit[23:0]) of the [SPI Master Transmit Counter Register](#). The transmission bursts in single mode before automatically sending dummy bursts are written in STC (bit[23:0]) of the [SPI Master Transmit Counter Register](#). For dummy data, the SPI controller can automatically send before receiving by writing DBC (bit[27:24]) in the [SPI Master Transmit Counter Register](#). If users do not use the SPI controller to send dummy data automatically, then the dummy bursts are used as the transmission counters to write together in MWTC (bit[23:0]) of the [SPI Master Transmit Counter Register](#). In master mode, the total burst numbers are written in MBC (bit[23:0]) of the [SPI Master Transmit Counter Register](#). When all transmission and reception bursts are transferred, the SPI controller will send a completed interrupt, at the same time, the SPI controller will clear DBC, MWTC, and MBC.

9.4.3.10 SPI Sample Mode and Run Clock Configuration

The SPI controller runs at 3 kHz–100 MHz at its interface to external SPI devices. The internal SPI clock should run at the same frequency as the outgoing clock in the master mode. The SPI clock is selected from different clock sources, the SPI must configure different work mode. There are three work modes: normal sample mode, delay half-cycle sample mode, delay one-cycle sample mode. Delay half-cycle sample mode is the default mode of the SPI controller. When the SPI runs at 40 MHz or below 40 MHz, the SPI can work at normal sample mode or delay half-cycle sample mode. When the SPI runs over 80 MHz, setting the SDC bit in the [SPI Transfer Control Register](#) to ‘1’ makes the internal read sample point with a half-cycle delay of SPI_CLK, which is used in high speed read operation to reduce the error caused by the time delay of SPI_CLK between master and slave. Table 9-16 and Table 9-17 show the different configurations of the SPI sample mode.

Table 9-16 SPI Old Sample Mode and Run Clock

| SPI Sample Mode | SDM(bit13) | SDC(bit11) | Run Clock |
|-------------------------|------------|------------|-----------|
| normal sample | 1 | 0 | <=24 MHz |
| delay half cycle sample | 0 | 0 | <=40 MHz |
| delay one cycle sample | 0 | 1 | >=80 MHz |

The remaining spectrum is not recommended. Because when the output delay of SPI flash (refer to the datasheet of the manufactures for the specific delay time) is the same with the half-cycle time of SPI working clock, the variable edge of the output data for the device bumps into the clock sampling edge of the controller, so setting 1 cycle of sampling delay would cause stability problem.

Table 9-17 SPI New Sample Mode

| SPI Sample Mode | SDM (bit13) | SDC (bit11) | SDC1 (bit15) |
|-------------------------|-------------|-------------|--------------|
| normal sample | 1 | 0 | 0 |
| delay half cycle sample | 0 | 0 | 0 |
| delay one cycle sample | 0 | 1 | 0 |
| delay 1.5 cycle sample | 1 | 1 | 0 |
| delay 2 cycle sample | 1 | 0 | 1 |
| delay 2.5 cycle sample | 0 | 0 | 1 |
| delay 3 cycle sample | 0 | 1 | 1 |

9.4.3.11 DBI 3-Line Interface Writing and Reading Timing

The 3-line DBI Interface I contains CSX, SDA, and SCL, where SDA shares this port for bidirectional port data input and output.

The 3-line DBI Interface II contains CSX, SDA, SCL, and SDI; Data input and output ports are independent of each other.

Since the 3-line display bus mode has no Data/Command data line indicating whether Data or Command is currently being transmitted, an extra bit is added to the data-stream before MSB to indicate whether Data or Command is currently being transmitted. (0: Command, 1: Data)

The following figure shows the writing operation format of 3-line DBI Interface I and Interface II.

Figure 9-39 DBI 3-Line Display Bus Serial Interface Writing Operation Format

The 3-line DBI Interface I uses the SDA port as bidirectional data input and output port. There are only three cases of data reading volume, 8bits/24bits/32bits, and the first data sampled is high.

The following figure shows the 8 bits reading operation format of 3-line DBI Interface I and Interface II. After the read command is transmitted, the data is read immediately with on dummy period.

Figure 9-40 DBI 3-Line Display Bus Serial Interface 8-bit Reading Operation Format

The following figure shows the 24 bits reading operation format of 3-line DBI Interface I and Interface II. After the read command is transmitted, the data is read after waiting for the dummy clock cycle.

Figure 9-41 DBI 3-Line Display Bus Serial Interface 24-bit Reading Operation Format

The following figure shows the 32 bits reading operation format of 3-line DBI Interface I and Interface II. After the read command is transmitted, the data is read after waiting for the dummy clock cycle.

Figure 9-42 DBI 3-Line Display Bus Serial Interface 32-bit Reading Operation Format

9.4.3.12 DBI 4-Line Interface Writing and Reading Timing

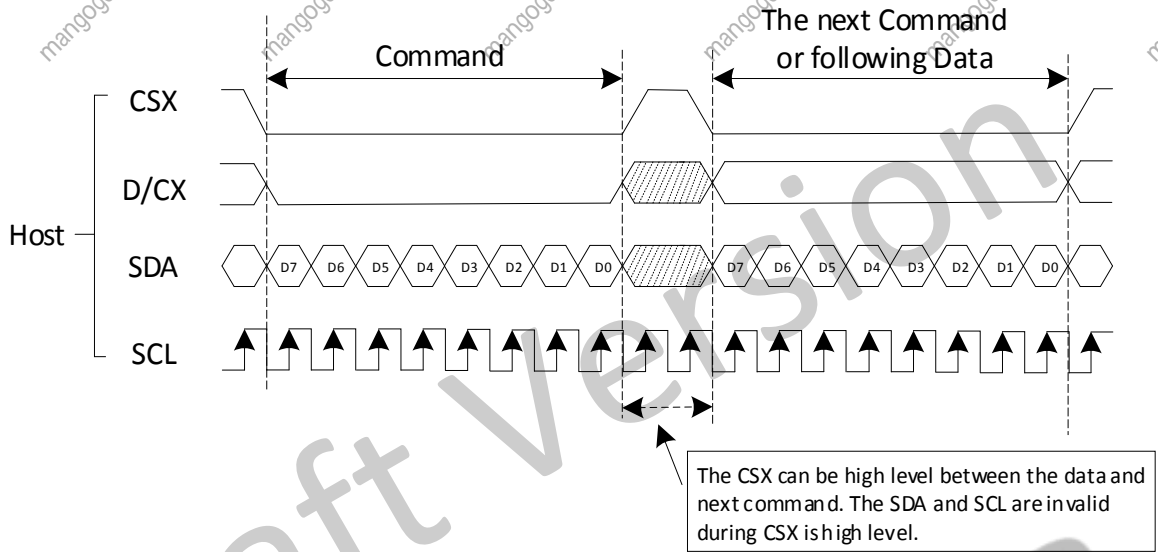

The 4-line DBI Interface I contains CSX, D/CX, SDA, and SCL, where SDA shares this port for bidirectional port data input and output.

The 4-line DBI Interface II contains CSX, D/CX, SDA, SCL, and SDI; Data input and output ports are independent of each other.

Since the 4-line display bus mode has a Data/Command data line indicating whether Data or Command is currently being transmitted (0: Command, 1: Data). So there is no need to add an extra bit to data-stream before MSB like the 3-line DBI.

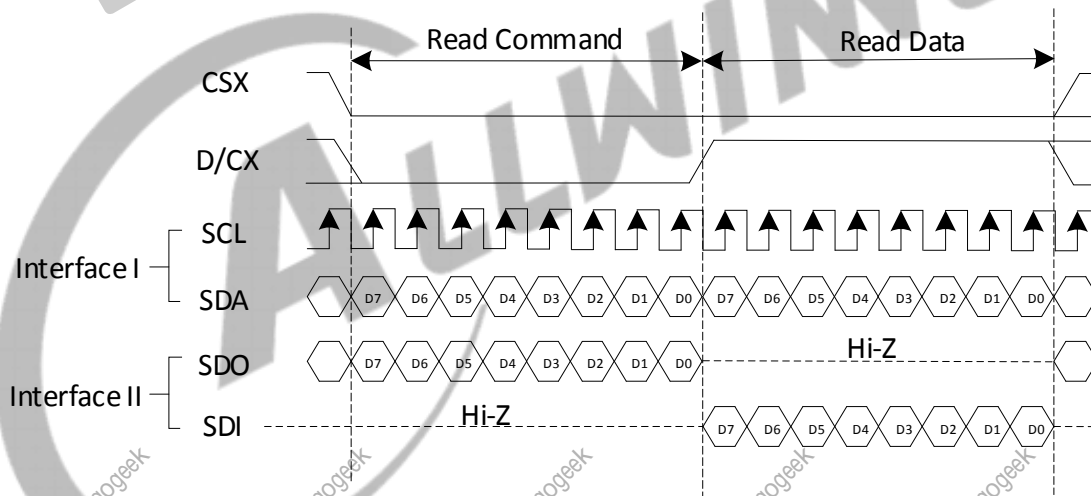

The following figure shows the writing operation format of 4-line DBI Interface I and Interface II.

Figure 9-43 DBI 4-Line Display Bus Serial Interface Writing Operation Format

The following figure shows the 8 bits reading operation format of 4-line DBI Interface I and Interface II.

Figure 9-44 DBI 4-Line Display Bus Serial Interface 8-bit Reading Operation Format

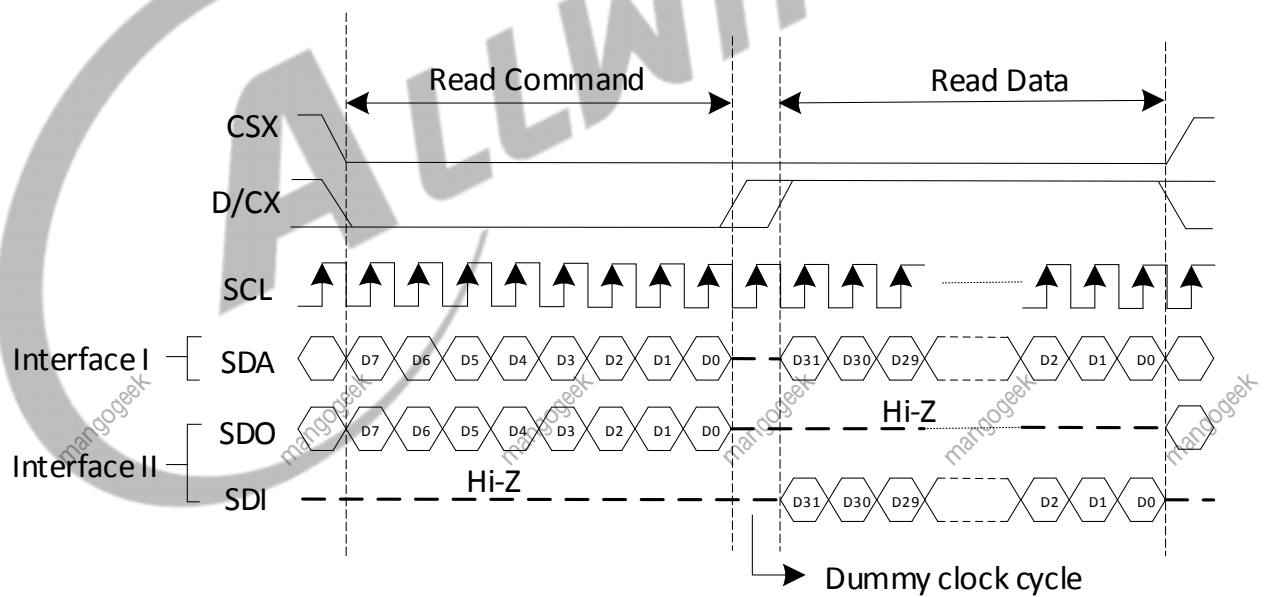

The following figure shows the 24 bits reading operation format of 4-line DBI Interface I and Interface II.

9.4.4 Programming Guidelines

9.4.4.1 Writing/Reading Data Process Using SPI Mode

The SPI transfers serial data between the processor and the external device. CPU and DMA are the two main operational modes for SPI. For each SPI, the data is simultaneously transmitted (shifted out serially) and received (shifted in serially). The SPI has 2 channels, including the TX channel and RX channel. The TX channel has the path from TX FIFO to the external device. The RX channel has the path from the external device to RX FIFO.

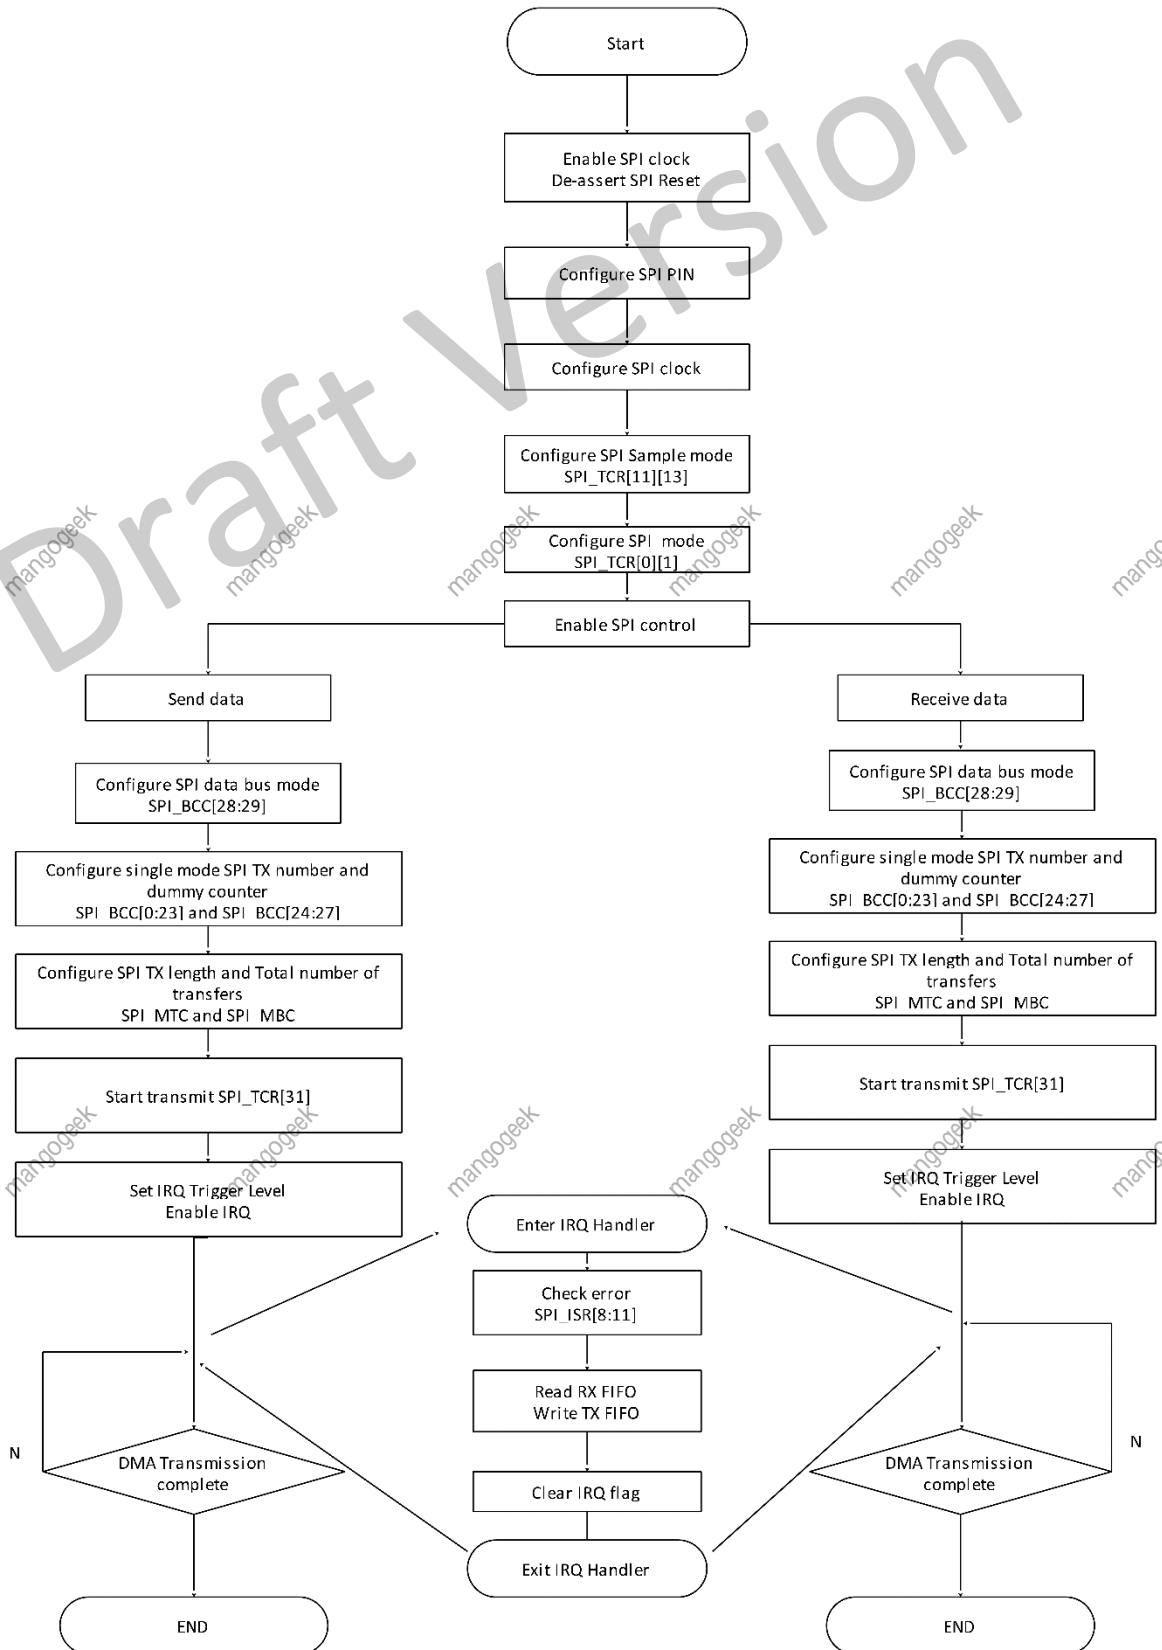

Write Data: CPU or DMA must write data on the [SPI_TXD](#) register, the data on the register are automatically moved to TX FIFO.

Read Data: To read data from RX FIFO, CPU or DMA must access the register [SPI_RXD](#) and data are automatically sent to the register [SPI_RXD](#).

In CPU or DMA mode, the SPI sends a completed interrupt ([SPI_ISR\[TC\]](#)) to the processor at the end of each transfer.

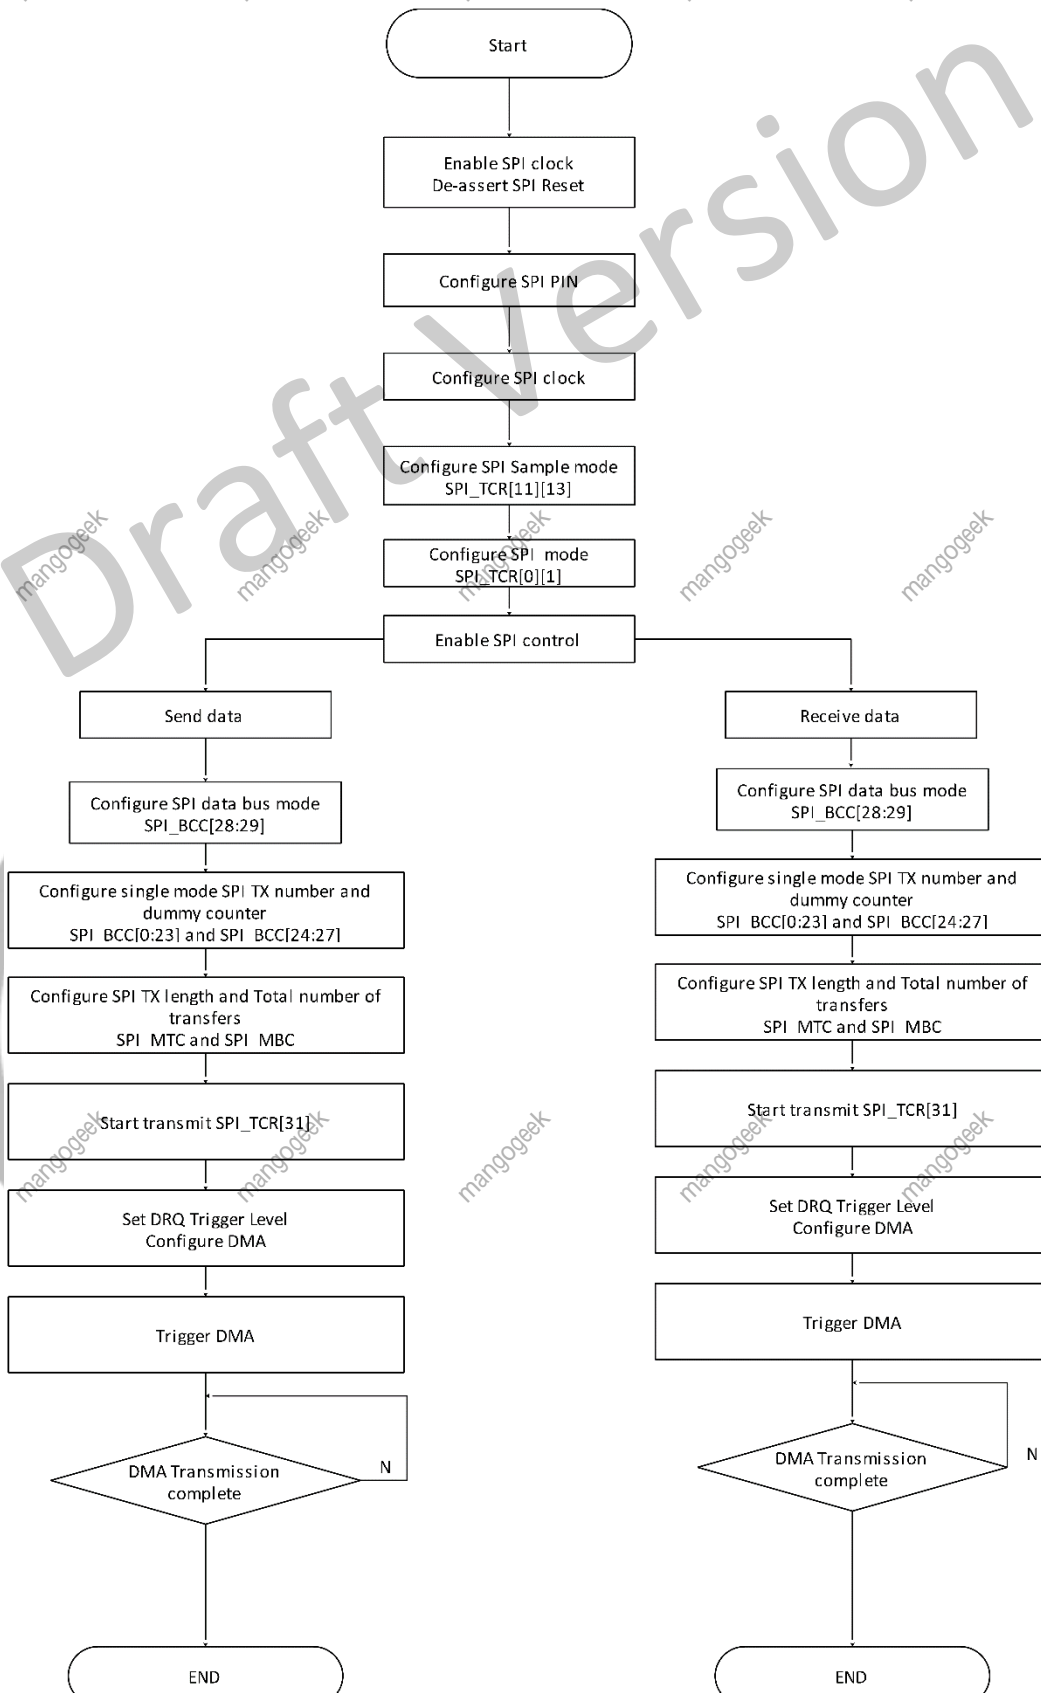

CPU Mode

Figure 9-61 SPI Write/Read Data in CPU Mode

DMA Mode

Figure 9-62 SPI Write/Read Data in DMA Mode

9.4.4.2 Calibrate Delay Chain Using SPI Mode

The SPI has one delay chain which is used to generate delay to make proper timing between the internal SPI clock signal and data signals. Delay chain is made up of 64 delay cells. The delay time of one delay cell can be estimated through delay chain calibration.

The steps to calibrate delay chain are as follows:

- Step 1** Enable SPI. To calibrate the delay chain by operation registers in SPI, the SPI must be enabled through AHB reset and AHB clock gating control registers.
- Step 2** Configure a proper clock for SPI. The calibration delay chain is based on the clock for SPI from CCU.
- Step 3** Set proper initial delay value. Write 0xA0 to the [SPI Sample Delay Control Register](#) to set initial delay value 0x20 to delay chain. Then write 0x0 to the [SPI Sample Delay Control Register](#) to clear this value.
- Step 4** Write 0x8000 to the [SPI Sample Delay Control Register](#) to start to calibrate the delay chain.
- Step 5** Wait until the flag (Bit14 in the [SPI Sample Delay Control Register](#)) of calibration done is set. The number of delay cells is shown at Bit[13:8] in [SPI Sample Delay Control Register](#). The delay time generated by these delay cells is equal to the cycle of SPI's clock nearly. This value is the result of calibration.
- Step 6** Calculate the delay time of one delay cell according to the cycle of the SPI clock and the result of calibration.

9.4.4.3 Transmitting Write Command Using DBI Mode

- Step 1** Set the [SPI DBI MODE SEL](#) (bit3) of [SPI_GCR](#) (0x0004) to 1 to select DBI mode.
- Step 2** Set the [DBI EN MODE SEL](#) (bit[30:29]) of [DBI_CTL_1](#) (0x0104) to 0 to select the trigger mode of DBI.
- Step 3** Configure the [DBI_CTL_0](#) (0x0100).
 - Set [DBI_CTL_0](#)[Command Type] (bit31) to 0 to configure the writing command.
 - Set [DBI_CTL_0](#)[Write Command Dummy Cycles] (bit[30:20]) to configure the number of dummy cycles between commands.
 - Set [DBI_CTL_0](#)[Output Data Sequence] (bit19) to select the MSB or LSB.
 - Set [DBI_CTL_0](#)[Transmit Mode] (bit15) to 0 to select the command path.
 - Set [DBI_CTL_0](#)[Output Data Format] (bit[14:12]) to 0 to transmit the command.
 - Set [DBI_CTL_0](#)[DBI interface Select] (bit[10:8]) to select the DBI interface type.
 - The remaining values of the [DBI_CTL_0](#) register remain the default value.

- Step 4** Set **DBI_CTL_1**[DCX_DATA] (bit22) to 0 to send the command.
- Step 5** DMA Path: Configure the **SPI_FCR** register (0x0018).
- Set **SPI_FCR**[TF_DRQ_EN] (bit24) to 1 to enable TXFIFO DMA.
 - Set **SPI_FCR**[TX_TRIG_LEVEL] (bit[23:16]) to 255. It indicates the controller requests data from DMA if the remaining space of TX FIFO is greater than 255.
- CPU Path: Write the command to be sent to the 0x200 address.
- Step 6** Set **SPI_GCR**[DBI_EN] (bit4) to 1 to start transmitting the command.
- Step 7** Wait until the TX FIFO underrun interrupt (**SPI_ISR**[TF_UDF]) is 1. It indicates that the command written to the TX FIFO is transmitted completely.

9.4.4.4 Transmitting Parameter Using DBI Mode

- Step 1** Set the **SPI_DBI_MODE_SEL** (bit3) of **SPI_GCR** (0x0004) to 1 to select DBI mode.
- Step 2** Set the **DBI_EN_MODE_SEL** (bit[30:29]) of **DBI_CTL_1** (0x0104) to 0 to select the trigger mode of DBI.
- Step 3** Configure the **DBI_CTL_0** register (0x0100).
- Set **DBI_CTL_0**[Command Type] (bit31) to 0 to configure the writing command.
 - Set **DBI_CTL_0**[Write Command Dummy Cycles] (bit[30:20]) to configure the number of dummy cycles between commands.
 - Set **DBI_CTL_0**[Output Data Sequence] (bit19) to select the MSB or LSB.
 - Set **DBI_CTL_0**[Transmit Mode] (bit15) to 0 to select the command path.
 - Set **DBI_CTL_0**[Output Data Format] (bit[14:12]) to 0 to transmit the command.
 - Set **DBI_CTL_0**[DBI interface Select] (bit[10:8]) to select the DBI interface type.
 - The remaining values of the **DBI_CTL_0** register remain the default value.
- Step 4** Set **DBI_CTL_1**[DCX_DATA] (bit22) to 1 to send the parameter.
- Step 5** DMA Path: Configure the [C:\Users\chenxiaofang\AppData\Roaming\Microsoft\Word\Hlk49435465 - Hlk49435792](#) register (0x0018).
- Set **SPI_FCR**[TF_DRQ_EN] (bit24) to 1 to enable TXFIFO DMA.
 - Set **SPI_FCR**[TX_TRIG_LEVEL] (bit[23:16]) to 255. It indicates the controller requests data from DMA if the remaining space of TX FIFO is greater than 255.
- CPU Path: Write the command to be sent to the 0x0200 address.
- Step 6** Set **SPI_GCR**[DBI_EN] (bit4) to 1 to start transmitting the command.

Step 7 Wait until the TX FIFO underrun interrupt ([SPI_ISR](#)[TF_UDF]) is 1. It indicates that the command written to the TX FIFO is transmitted completely.

9.4.4.5 Transmitting Video Using DBI Mode

Set the [SPI_DBI_MODE_SEL](#) (bit3) of [SPI_GCR](#) (0x0004) to 1 to select DBI mode.

If the data is from the CPU path, the controller writes the command to be sent to the 0x0200 address by the AHB bus.

If the data is from the DMA path, configure [DBI_CTL_1](#)[DBI_FIFO_DRQ_EN] (bit15) to 1 and [DBI_CTL_1](#)[TX_TRIG_LEVEL] (bit[14:8]) to 64, which indicates the controller requests data from DMA if the remaining space of TX FIFO is greater than 64.

Software Trigger Mode

The software enables DBI_en_trigger when the edge interrupt of TE is detected.

After transmitting each frame image, the controller clears automatically the line_cnt, pixel_cnt and stops transmitting data.

Wait for the edge interrupt of TE, the software needs to enable DBI_en_trigger, in circulation.

The operation process is as follows.

Step 1 Set the [SPI_DBI_MODE_SEL](#) (bit3) of [SPI_GCR](#) (0x0004) to 1 to select DBI mode.

Step 2 Set the [DBI_EN_MODE_SEL](#) (bit[30:29]) of [DBI_CTL_1](#) (0x0104) to 1 to select the software trigger mode.

Step 3 Configure the [DBI_CTL_0](#) register (0x0100).

- Set [DBI_CTL_0](#)[Command Type] (bit31) to 0 to set the writing command.
- Set [DBI_CTL_0](#)[Write Command Dummy Cycles] (bit[30:20]) to configure the number of dummy cycles between commands.
- Set [DBI_CTL_0](#)[Output Data Sequence] (bit19) to select the MSB or LSB.
- Set [DBI_CTL_0](#)[Transmit Mode] (bit15) to 1 to select the image path.
- Set [DBI_CTL_0](#)[Output Data Format] (bit[14:12]) to select RGB111//444/565/666/888.
- Set [DBI_CTL_0](#)[DBI interface Select] (bit[10:8]) to select the DBI interface type.
- The remaining values of the [DBI_CTL_0](#) register remain the default value.

Step 4 Set [DBI_CTL_1](#)[DCX_DATA] (bit22) to 0 to send the image data.

Step 5 Configure [DBI_Video_Size](#) (0x110) according to the sent image size.

Step 6 Configure [DBI_CTL_2](#) (0x0108) to set the TE-related parameter.

Step 7 Detect the TE interrupt of the [DBI_INT](#) (0x0120) register.

Step 8 Configure [DBI_CTL_1](#)[DBI_soft_trigger] to 1.

Timer Trigger Mode

The software configures timer_en to enable timer counting, and when the counter reaches the specified value, the DBI_EN automatically can be enabled to start transmitting data.

After transmitting each frame image, the controller clears automatically the line_cnt, pixel_cnt, and stops transmitting data.

The timer starts counting again. When the counter reaches the specified value, the controller automatically enables DBI_EN, and in circulation until the software turns off the timer_en.

The operation process is as follows.

Step 1 Set the [SPI_DBI_MODE_SEL](#) (bit3) of [SPI_GCR](#) (0x0004) to 1 to select DBI mode.

Step 2 Set the [DBI_EN_MODE_SEL](#) (bit30:29) of [DBI_CTL_1](#) (0x0104) to 2 to select the timer trigger mode.

Step 3 Configure the [DBI_CTL_0](#) register (0x0100).

- Set [DBI_CTL_0](#)[Command Type] (bit31) to 0 to set the writing command.
- Set [DBI_CTL_0](#)[Write Command Dummy Cycles] (bit[30:20]) to configure the number of dummy cycles between commands.
- Set [DBI_CTL_0](#)[Output Data Sequence] (bit19) to select the MSB or LSB.
- Set [DBI_CTL_0](#)[Transmit Mode] (bit15) to 1 to select the image path.
- Set [DBI_CTL_0](#)[Output Data Format] (bit[14:12]) to select RGB111/444/565/666/888.
- Set [DBI_CTL_0](#)[DBI interface Select] (bit[10:8]) to select the DBI interface type.
- The remaining values of the [DBI_CTL_0](#) register remain the default value.

Step 4 Set [DBI_CTL_1](#)[DCX_DATA] (bit22) to 0 to send the image data.

Step 5 Configure [DBI_Video_Size](#) (0x110) to transmit the image size.

Step 6 Configure the related parameter of [DBI_Timer](#) (0x10C).

TE Trigger Mode

When the edge changes of the TE are detected (The rising and falling edges are optional), the DBI_EN automatically can be enabled to start transmitting data.

After transmitting each frame image, the controller clears automatically the line_cnt, pixel_cnt, and stops transmitting data.

When the edge changes of the TE are detected (The rising and falling edges are optional), the DBI_EN automatically can be enabled to start transmitting data until the software shuts down TE_EN or the screen no longer sends TE signals.

The operation process is as follows.

Step 1 Set the [SPI DBI MODE SEL](#) (bit3) of [SPI_GCR](#) (0x0004) to 1 to select DBI mode.

Step 2 Set the [DBI EN MODE SEL](#) (bit30:29) of [DBI_CTL_1](#) (0x0104) to 3 to select the TE trigger mode.

Step 3 Configure the [DBI_CTL_0](#) register (0x0100).

- Set [DBI_CTL_0](#)[Command Type] (bit31) to 0 to set the writing command.
- Set [DBI_CTL_0](#)[Write Command Dummy Cycles] (bit[30:20]) to configure the number of dummy cycles between commands.
- Set [DBI_CTL_0](#)[Output Data Sequence] (bit19) to select the MSB or LSB.
- Set [DBI_CTL_0](#)[Transmit Mode] (bit15) to 1 to select the image path.
- Set [DBI_CTL_0](#)[Output Data Format] (bit[14:12]) to select RGB111/444/565/666/888.
- Set [DBI_CTL_0](#)[DBI interface Select] (bit[10:8]) to select the DBI interface type.
- The remaining values of the [DBI_CTL_0](#) register remain the default value.

Step 4 Configure [DBI_CTL_1](#)[DCX_DATA] (bit22) to 0 to send the image data.

Step 5 Configure [DBI Video Size](#) (0x0110) to transmit the image size.

Step 6 Configure [DBI_CTL_2](#) (0x0108) to set the TE-related parameter.

9.4.4.6 Transmitting Read Command and Read Data Using DBI Mode

Step 1 Set the [SPI DBI MODE SEL](#) (bit3) of [SPI_GCR](#) (0x0004) to 1 to select DBI mode.

Step 2 Set the [DBI EN MODE SEL](#) (bit[30:29]) of [DBI_CTL_1](#) (0x0104) to 0.

Step 3 Configure the [DBI_CTL_0](#) register (0x0100).

- Set [DBI_CTL_0](#)[Command Type] (bit31) to 0 to set the reading command.
- Set [DBI_CTL_0](#)[Output Data Sequence] (bit19) to select the MSB or LSB.
- Set [DBI_CTL_0](#)[Transmit Mode] (bit15) to 0 to select the command path.
- Set [DBI_CTL_0](#)[Output Data Format] (bit[14:12]) to 0.
- Set [DBI_CTL_0](#)[DBI interface Select] (bit[10:8]) to select the DBI interface type.

- The remaining values of the **DBI_CTL 0** register remain the default value.

Step 4 Configure the **DBI_CTL 1** register (0x0104).

- Configure **DBI_CTL 1**[DCX_DATA] (bit22) to 0 to send the command.
- Configure **DBI_CTL 1**[Read_MSB_First] (bit20) to select whether the first bit of the read data is the highest or lowest bit of data.
- Configure **DBI_CTL 1**[Read Data Number of Bytes] to set the byte number to be read.
- Configure **DBI_CTL 1**[Read Command Dummy Cycles] to set the dummy cycle between the read command and the read data, when the dummy cycle is complete, the data starts to be sampled.

Step 5 DMA Path: Configure the **SPI_FCR** register (0x0018).

- Set **SPI_FCR**[RF_DRQ_EN] (bit8) to 1 to enable RXFIFO DMA.
- Set **SPI_FCR**[RX_TRIG_LEVEL] (bit[7:0]) to 32, which indicates the controller requests receiving data from DMA if the data of the RX FIFO is greater than 64.

CPU Path: Read data in RX FIFO from the 0x0300 address.

Step 6 Set **SPI_GCR**[DBI_EN] (bit4) to 1 to start transmitting command.

Step 7 Wait until **DBI_INT**[RD_DONE_INT] is 1. It indicates that the data is read completely.

9.4.5 Register List

| Module Name | Base Address |
|-------------|--------------|
| SPI_DBI | 0x04026000 |

| Register Name | Offset | Description |
|---------------|--------|--------------------------------------|
| SPI_GCR | 0x0004 | SPI Global Control Register |
| SPI_TCR | 0x0008 | SPI Transfer Control Register |
| SPI_IER | 0x0010 | SPI Interrupt Control Register |
| SPI_ISR | 0x0014 | SPI Interrupt Status Register |
| SPI_FCR | 0x0018 | SPI FIFO Control Register |
| SPI_FSR | 0x001C | SPI FIFO Status Register |
| SPI_WCR | 0x0020 | SPI Wait Clock Register |
| SPI_SAMP_DL | 0x0028 | SPI Sample Delay Control Register |
| SPI_MBC | 0x0030 | SPI Master Burst Counter Register |
| SPI_MTC | 0x0034 | SPI Master Transmit Counter Register |

| Register Name | Offset | Description |
|-------------------|--------|--|
| SPI_BCC | 0x0038 | SPI Master Burst Control Register |
| SPI_BATCR | 0x0040 | SPI Bit-Aligned Transfer Configure Register |
| SPI_BA_CCR | 0x0044 | SPI Bit-Aligned Clock Configuration Register |
| SPI_TBR | 0x0048 | SPI TX Bit Register |
| SPI_RBR | 0x004C | SPI RX Bit Register |
| SPI_NDMA_MODE_CTL | 0x0088 | SPI Normal DMA Mode Control Register |
| DBI_CTL_0 | 0x0100 | DBI Control Register 0 |
| DBI_CTL_1 | 0x0104 | DBI Control Register 1 |
| DBI_CTL_2 | 0x0108 | DBI Control Register 2 |
| DBI_TIMER | 0x010C | DBI Timer Control Register |
| DBI_VIDEO_SZIE | 0x0110 | DBI Video Size Configuration Register |
| DBI_INT | 0x0120 | DBI Interrupt Register |
| DBI_DEBUG_0 | 0x0124 | DBI BEBUG 0 Register |
| DBI_DEBUG_1 | 0x0128 | DBI BEBUG 1 Register |
| SPI_TXD | 0x0200 | SPI TX Data register |
| SPI_RXD | 0x0300 | SPI RX Data register |

9.4.6 Register Description

9.4.6.1 0x0004 SPI Global Control Register (Default Value: 0x0000_0080)

| Offset:0x0004 | | | Register Name: SPI_GCR |
|---------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R/WAC | 0x0 | SRST Soft reset Writing '1' to this bit will clear the SPI controller, and auto clear to '0' when reset operation completes. Writing '0' to this bit has no effect. |
| 30:8 | / | / | / |

| Offset:0x0004 | | | Register Name: SPI_GCR |
|---------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 7 | R/W | 0x1 | <p>TP_EN</p> <p>Transmit Pause Enable</p> <p>In master mode, it is used to control transmit state machine to stop smart burst sending when RX FIFO is full.</p> <p>0: Normal operation, ignore RXFIFO status</p> <p>1: Stop transmit data when RXFIFO full</p> <p>Cannot be written when XCH=1.</p> |
| 6:5 | / | / | / |
| 4 | R/W | 0x0 | <p>DBI_EN</p> <p>DBI Module Enable Control</p> <p>0: Disable</p> <p>1: Enable</p> |
| 3 | R/W | 0x0 | <p>SPI_DBI_MODE_SEL</p> <p>DBI Working Mode Select</p> <p>0: SPI MODE</p> <p>1: DBI MODE</p> |
| 2 | R/W | 0x0 | <p>MODE_SELEC</p> <p>Sample Timing Mode Select</p> <p>0: Old mode of Sample Timing</p> <p>1: New mode of Sample Timing</p> <p>Cannot be written when XCH=1.</p> |
| 1 | R/W | 0x0 | <p>MODE</p> <p>SPI Function Mode Select</p> <p>0: Slave mode</p> <p>1: Master mode</p> <p>Cannot be written when XCH=1.</p> |
| 0 | R/W | 0x0 | <p>EN</p> <p>SPI Module Enable Control</p> <p>0: Disable</p> <p>1: Enable</p> <p>After transforming from bit_mode to byte_mode, it must enable the SPI module again.</p> |

9.4.6.2 0x0008 SPI Transfer Control Register (Default Value: 0x0000_0087)

| Offset: 0x0008 | | | Register Name: SPI_TCR |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R/WAC | 0x0 | <p>XCH Exchange Burst In master mode, it is used to start SPI burst 0: Idle 1: Initiates exchange. Writing "1" to this bit will start the SPI burst, and will auto-clear after finishing the bursts transfer specified by BC. Writing "1" to SRST will also clear this bit. Writing '0' to this bit has no effect. Cannot be written when XCH=1.</p> |
| 30:16 | / | / | / |
| 15 | R/W | 0x0 | <p>SDC1 Master Sample Data Control register1 Set this bit to '1' to make the internal read sample point with a delay of half-cycle of SPI_CLK. It is used in high speed read operation to reduce the error caused by the time delay of SPI_CLK between master and slave. 0: Normal operation, do not delay the internal read sample point 1: Delay the internal read sample point Cannot be written when XCH=1.</p> |
| 14 | R/W | 0x0 | <p>SDDM Sending Data Delay Mode 0: Normal sending 1: Delay sending Set the bit to "1" to make the data that should be sent with a delay of half-cycle of SPI_CLK in dual IO mode for SPI mode 0. Cannot be written when XCH=1.</p> |
| 13 | R/W | 0x0 | <p>SDM Master Sample Data Mode 0: Delay sample mode 1: Normal sample mode In normal sample mode, the SPI master samples the data at the correct edge for each SPI mode; In delay sample mode, the SPI master samples data at the edge that is half cycle delayed by the correct edge defined in respective SPI mode. Cannot be written when XCH=1.</p> |

| Offset: 0x0008 | | | Register Name: SPI_TCR |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 12 | R/W | 0x0 | <p>FBS</p> <p>First Transmit Bit Select</p> <p>0: MSB first. The upper bits are transmitted first.</p> <p>1: LSB first. The lower bits are transmitted first.</p> <p>Cannot be written when XCH=1.</p> |
| 11 | R/W | 0x0 | <p>SDC</p> <p>Master Sample Data Control</p> <p>Set this bit to '1' to make the internal read sample point with a delay of half-cycle of SPI_CLK. It is used in high speed read operation to reduce the error caused by the time delay of SPI_CLK between master and slave.</p> <p>0: Normal operation, do not delay the internal read sample point</p> <p>1: Delay the internal read sample point</p> <p>Cannot be written when XCH=1.</p> |
| 10 | R/W | 0x0 | <p>RPSM</p> <p>Rapids Mode Select</p> <p>Select rapid mode for high speed write.</p> <p>0: Normal write mode</p> <p>1: Rapid write mode</p> <p>Cannot be written when XCH=1.</p> |
| 9 | R/W | 0x0 | <p>DDB</p> <p>Dummy Burst Type</p> <p>0: The bit value of dummy SPI burst is zero</p> <p>1: The bit value of dummy SPI burst is one</p> <p>Cannot be written when XCH=1.</p> |
| 8 | R/W | 0x0 | <p>DHB</p> <p>Discard Hash Burst</p> <p>In master mode, it controls whether discarding unused SPI bursts</p> <p>0: Receiving all SPI bursts in the BC period</p> <p>1: Discard unused SPI bursts, only fetching the SPI bursts during the dummy burst period. The burst number is specified by TC.</p> <p>Cannot be written when XCH=1.</p> |

| Offset: 0x0008 | | | Register Name: SPI_TCR |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 7 | R/W | 0x1 | <p>SS_LEVEL SPI Chip Select Level</p> <p>When control SS signal manually (SS_OWNER (SPI_TCR[6])=1), set this bit to '1' or '0' to control the level of SS signal.</p> <p>0: Set SS to low 1: Set SS to high</p> <p>Cannot be written when XCH=1.</p> |
| 6 | R/W | 0x0 | <p>SS_OWNER SS Output Owner Select</p> <p>Usually, the controller sends the SS signal automatically with data together. When this bit is set to 1, the software must manually write SS_LEVEL (SPI_TCR[7]) to 1 or 0 to control the level of the SS signal.</p> <p>0: SPI controller 1: Software</p> <p>Cannot be written when XCH=1.</p> |
| 5:4 | R/W | 0x0 | <p>SS_SEL SPI Chip Select</p> <p>Select one of four external SPI Master/Slave Devices</p> <p>00: SPI_SS0 will be asserted 01: SPI_SS1 will be asserted 10: SPI_SS2 will be asserted 11: SPI_SS3 will be asserted</p> <p>Cannot be written when XCH=1.</p> |
| 3 | R/W | 0x0 | <p>SSCTL</p> <p>In master mode, this bit selects the output waveform for the SPI_SSx signal. Only valid when SS_OWNER (SPI_TCR[6])= 0.</p> <p>0: SPI_SSx remains asserted between SPI bursts 1: Negate SPI_SSx between SPI bursts</p> <p>Cannot be written when XCH=1.</p> |
| 2 | R/W | 0x1 | <p>SPOL SPI Chip Select Signal Polarity Control</p> <p>0: Active high polarity (0 = Idle) 1: Active low polarity (1 = Idle)</p> <p>Cannot be written when XCH=1.</p> |

| Offset: 0x0008 | | | Register Name: SPI_TCR |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 1 | R/W | 0x1 | CPOL SPI Clock Polarity Control 0: Active high polarity (0 = Idle) 1: Active low polarity (1 = Idle) Cannot be written when XCH=1. |
| 0 | R/W | 0x1 | CPHA SPI Clock/Data Phase Control 0: Phase 0 (Leading edge for sample data) 1: Phase 1 (Leading edge for setup data) Cannot be written when XCH=1. |

9.4.6.3 0x0010 SPI Interrupt Control Register (Default Value: 0x0000_0000)

| Offset: 0x0010 | | | Register Name: SPI_IER |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:14 | / | / | / |
| 13 | R/W | 0x0 | SS_INT_EN SSI Interrupt Enable Chip select signal (SSx) from the valid state to the invalid state 0: Disable 1: Enable |
| 12 | R/W | 0x0 | TC_INT_EN Transfer Completed Interrupt Enable 0: Disable 1: Enable |
| 11 | R/W | 0x0 | TF_UDR_INT_EN TXFIFO Underrun Interrupt Enable 0: Disable 1: Enable |
| 10 | R/W | 0x0 | TF_OVF_INT_EN TX FIFO Overflow Interrupt Enable 0: Disable 1: Enable |

| Offset: 0x0010 | | | Register Name: SPI_IER |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 9 | R/W | 0x0 | RF_UDR_INT_EN RXFIFO Underrun Interrupt Enable 0: Disable 1: Enable |
| 8 | R/W | 0x0 | RF_OVF_INT_EN RX FIFO Overflow Interrupt Enable 0: Disable 1: Enable |
| 7 | / | / | / |
| 6 | R/W | 0x0 | TF_FUL_INT_EN TX FIFO Full Interrupt Enable 0: Disable 1: Enable |
| 5 | R/W | 0x0 | TX_EMP_INT_EN TX FIFO Empty Interrupt Enable 0: Disable 1: Enable |
| 4 | R/W | 0x0 | TX_ERQ_INT_EN TX FIFO Empty Request Interrupt Enable 0: Disable 1: Enable |
| 3 | / | / | / |
| 2 | R/W | 0x0 | RF_FUL_INT_EN RX FIFO Full Interrupt Enable 0: Disable 1: Enable |
| 1 | R/W | 0x0 | RX_EMP_INT_EN RX FIFO Empty Interrupt Enable 0: Disable 1: Enable |
| 0 | R/W | 0x0 | RF_RDY_INT_EN RX FIFO Ready Request Interrupt Enable 0: Disable 1: Enable |

9.4.6.4 0x0014 SPI Interrupt Status Register (Default Value: 0x0000_0032)

| Offset: 0x0014 | | | Register Name: SPI_ISR |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:14 | / | / | / |
| 13 | R/W1C | 0x0 | SSI SS Invalid Interrupt When SSI is 1, it indicates that SS has changed from the valid state to the invalid state. Writing 1 to this bit clears it. |
| 12 | R/W1C | 0x0 | TC Transfer Completed In master mode, it indicates that all bursts specified by BC have been exchanged. In other conditions, when set, this bit indicates that all the data in TXFIFO has been loaded in the Shift register, and the Shift register has shifted out all the bits. Writing 1 to this bit clears it. 0: Busy 1: Transfer completed |
| 11 | R/W1C | 0x0 | TF_UDF TXFIFO Underrun This bit is set when the TXFIFO is underrun. Writing 1 to this bit clears it. 0: TXFIFO is not underrun 1: TXFIFO is underrun |
| 10 | R/W1C | 0x0 | TF_OVF TXFIFO Overflow This bit is set when the TXFIFO is overflowed. Writing 1 to this bit clears it. 0: TXFIFO is not overflowed 1: TXFIFO is overflowed |
| 9 | R/W1C | 0x0 | RX_UDF RXFIFO Underrun When set, this bit indicates that RXFIFO is underrun. Writing 1 to this bit clears it. 0: RXFIFO is not underrun 1: RXFIFO is underrun |

| Offset: 0x0014 | | | Register Name: SPI_ISR |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 8 | R/W1C | 0x0 | <p>RX_OVF RXFIFO Overflow</p> <p>When set, this bit indicates that RXFIFO is overflowed. Writing 1 to this bit clears it.</p> <p>0: RXFIFO is not overflowed 1: RXFIFO is overflowed</p> |
| 7 | / | / | / |
| 6 | R/W1C | 0x0 | <p>TX_FULL TXFIFO Full</p> <p>This bit is set when the TXFIFO is full. Writing 1 to this bit clears it.</p> <p>0: TXFIFO is not Full 1: TXFIFO is Full</p> |
| 5 | R/W1C | 0x1 | <p>TX_EMP TXFIFO Empty</p> <p>This bit is set when the TXFIFO is empty. Writing 1 to this bit clears it.</p> <p>0: TXFIFO contains one or more words. 1: TXFIFO is empty</p> |
| 4 | R/W1C | 0x1 | <p>TX_READY TXFIFO Ready</p> <p>0: TX_WL > TX_TRIG_LEVEL 1: TX_WL <= TX_TRIG_LEVEL</p> <p>This bit will be immediately set to 1 if TX_WL <= TX_TRIG_LEVEL. Writing "1" to this bit clears it. The TX_WL is the water level of TXFIFO.</p> |
| 3 | / | / | / |
| 2 | R/W1C | 0x0 | <p>RX_FULL RXFIFO Full</p> <p>This bit is set when the RXFIFO is full. Writing 1 to this bit clears it.</p> <p>0: Not Full 1: Full</p> |
| 1 | R/W1C | 0x1 | <p>RX_EMP RXFIFO Empty</p> <p>This bit is set when the RXFIFO is empty. Writing 1 to this bit clears it.</p> <p>0: Not empty 1: empty</p> |

| Offset: 0x0014 | | | Register Name: SPI_ISR |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 0 | R/W1C | 0x0 | <p>RX_RDY</p> <p>RXFIFO Ready</p> <p>0: RX_WL < RX_TRIG_LEVEL</p> <p>1: RX_WL >= RX_TRIG_LEVEL</p> <p>This bit will be immediately set to 1 if RX_WL >= RX_TRIG_LEVEL. Writing "1" to this bit clears it. The RX_WL is the water level of RXFIFO.</p> |

9.4.6.5 0x0018 SPI FIFO Control Register (Default Value: 0x0040_0001)

| Offset: 0x0018 | | | Register Name: SPI_FCR |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R/WAC | 0x0 | <p>TX_FIFO_RST</p> <p>TX FIFO Reset</p> <p>Writing '1' to this bit will reset the control portion of the TXFIFO and auto clear to '0' when completing the reset operation, writing '0' to this bit has no effect.</p> |
| 30 | R/W | 0x0 | <p>TF_TEST_ENB</p> <p>TX Test Mode Enable</p> <p>0: Disable</p> <p>1: Enable</p> <p>In normal mode, the TXFIFO can only be read by the SPI controller, writing '1' to this bit will switch the read and write function of TXFIFO to AHB bus. This bit is used to test the TXFIFO, do not set in normal operation, and do not set RF_TEST and TF_TEST at the same time.</p> |
| 29:25 | / | / | / |

In the byte accessing method, if there are data in RXFIFO, the top word is returned and the RXFIFO depth is decreased by 1. In the half-word accessing method, two SPI bursts are returned and the RXFIFO depth is decreased by 2. In the word accessing method, the four SPI bursts are returned and the RXFIFO depth is decreased by 4.</p> <p>Note: This address is readable-only if RF_TEST is '0', and if RF_TEST is set to '1', this address is readable and writable to test the RX FIFO through the AHB bus.</p> |

9.5 USB2.0 DRD

9.5.1 Overview

The USB2.0 dual-role device (USB2.0 DRD) supports both device and host functions which can also be configured as a Host-only or Device-only controller. It complies with the USB2.0 Specification.

For saving CPU bandwidth, the DMA interface of the DRD module can also support the external DMA controller to do the data transfer between the memory and the DRD FIFO. The DRD core also supports USB power saving functions.

The USB2.0 DRD has the following features:

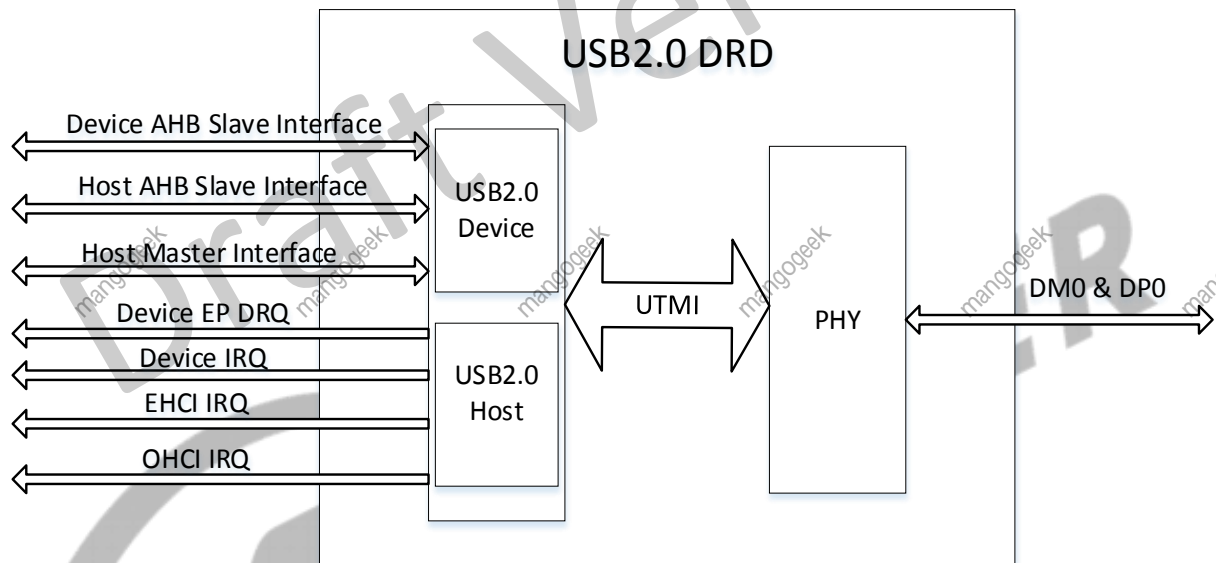

- Complies with USB2.0 Specification
- Supports USB Host function
 - Compatible with Enhanced Host Controller Interface (EHCI) Specification, Version 1.0
 - Compatible with Open Host Controller Interface (OHCI) Specification, Version 1.0a
 - Supports High-Speed (HS, 480 Mbit/s), Full-Speed (FS, 12 Mbit/s), and Low-Speed (LS, 1.5 Mbit/s)
 - Supports only 1 USB Root port shared between EHCI and OHCI
- Supports USB Device function
 - Supports High-Speed (HS, 480 Mbit/s), Full-Speed (FS, 12 Mbit/s)
 - Supports bi-directional endpoint0 (EP0) for Control transfer
 - Up to 10 user-configurable endpoints (EP1+, EP1-, EP2+, EP2-, EP3+, EP3-, EP4+, EP4-, EP5+, EP5-) for Bulk transfer, Isochronous transfer and Interrupt transfer
 - Up to (8 KB + 64 Bytes) FIFO for all EPs (including EP0)
 - Support interface to an external Normal DMA controller for every EP
- Support an internal DMA controller for data transfer with memory
- Supports High-Bandwidth Isochronous & Interrupt transfers
- Automated splitting/combining of packets for Bulk transfers
- Supports point-to-point and point-to-multipoint transfer in both Host and Peripheral modes
- Includes automatic ping capabilities
- Soft connect/disconnect function
- Performs all transaction scheduling in hardware

- Power optimization and power management capabilities
- Device and host controller share a 8K SRAM and a physical PHY

9.6 USB2.0 HOST

9.6.1 Overview

The USB Host Controller is fully compliant with USB 2.0 Specification, Enhanced Host Controller Interface (EHCI) Specification Revision 1.0 and Open Host Controller Interface (OHCI) Specification Release 1.0a.

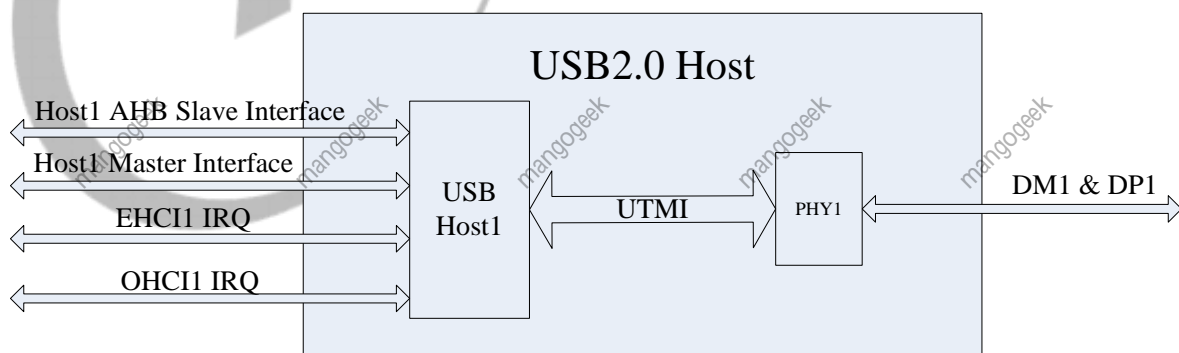

The USB2.0 host controller includes the following features:

- Complies with USB2.0 Specification
- Supports USB2.0 Host function
 - Compatible with Enhanced Host Controller Interface (EHCI) Specification, Version 1.0
 - Compatible with Open Host Controller Interface (OHCI) Specification, Version 1.0a
 - Supports High-Speed (HS, 480 Mbit/s), Full-Speed (FS, 12 Mbit/s) and Low-Speed (LS, 1.5 Mbit/s) Device
 - Supports only 1 USB Root port shared between EHCI and OHCI
- An internal DMA Controller for data transfer with memory

9.6.5 EHCI Register Description

9.6.5.1 0x0000 EHCI Identification Register (Default Value:0x10)

| Offset:0x0000 | | | Register Name: CAPLENGTH |
|---------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 7:0 | R | 0x10 | CAPLENGTH The value in these bits indicates an offset to add to register base to find the beginning of the Operational Register Space. |

9.6.5.2 0x0002 EHCI Host Interface Version Number Register (Default Value:0x0100)

| Offset: 0x0002 | | | Register Name: HCVERSION |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 15:0 | R | 0x0100 | HCVERSION This is a 16-bit register containing a BCD encoding of the EHCI revision number supported by this host controller. The most significant byte of this register represents a major revision and the least significant byte is the minor revision. |

9.6.5.3 0x0004 EHCI Host Control Structural Parameter Register (Default Value:0x0000_1101)

| Offset: 0x0004 | | | Register Name: HCSPARAMS |
|----------------|------------|-------------|--------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:24 | / | / | / |
| 23:20 | R | 0x0 | Debug Port Number |

| Offset: 0x0004 | | | Register Name: HCSPARAMS | | | | | | |
|----------------|---|-------------|--|-------|---------|---|---|---|--|
| Bit | Read/Write | Default/Hex | Description | | | | | | |
| | | | <p>This register identifies which of the host controller ports is the debug port. The value is the port number (one based) of the debug port.</p> <p>This field will always be '0'.</p> | | | | | | |
| 19:16 | / | / | / | | | | | | |
| 15:12 | R | 0x1 | <p>Number of Companion Controller (N_CC)</p> <p>This field indicates the number of companion controllers associated with this USB2.0 host controller. A zero in this field indicates there are no companion host controllers. And a value larger than zero in this field indicates there are companion USB1.1 host controller(s).</p> <p>This field will always be '0'.</p> | | | | | | |
| 11:8 | R | 0x1 | <p>Number of Port per Companion Controller (N_PCC)</p> <p>This field indicates the number of ports supported per companion host controller. It is used to indicate the port routing configuration to system software.</p> <p>This field will always fix with '0'.</p> | | | | | | |
| 7 | R | 0x0 | <p>Port Routing Rules</p> <p>This field indicates the method used by this implementation for how all ports are mapped to companion controllers. The value of this field has the following interpretation:</p> <table border="1" data-bbox="699 1245 1426 1554"> <thead> <tr> <th>Value</th> <th>Meaning</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>The first N_PCC ports are routed to the lowest numbered function companion host controller, the next N_PCC port are routed to the next lowest function companion controller, and so on.</td> </tr> <tr> <td>1</td> <td>The port routing is explicitly enumerated by the first N_PORTS elements of the HCSP-PORTROUTE array.</td> </tr> </tbody> </table> <p>This field will always be '0'.</p> | Value | Meaning | 0 | The first N_PCC ports are routed to the lowest numbered function companion host controller, the next N_PCC port are routed to the next lowest function companion controller, and so on. | 1 | The port routing is explicitly enumerated by the first N_PORTS elements of the HCSP-PORTROUTE array. |
| Value | Meaning | | | | | | | | |
| 0 | The first N_PCC ports are routed to the lowest numbered function companion host controller, the next N_PCC port are routed to the next lowest function companion controller, and so on. | | | | | | | | |
| 1 | The port routing is explicitly enumerated by the first N_PORTS elements of the HCSP-PORTROUTE array. | | | | | | | | |
| 6:4 | / | / | / | | | | | | |
| 3:0 | R | 0x1 | <p>N_PORTS</p> <p>This field specifies the number of physical downstream ports implemented on this host controller. The value of this field determines how many port registers are addressable in the Operational Register Space. Valid values are in the range of 0x1 to 0x0f.</p> <p>This field is always 1.</p> | | | | | | |

9.6.5.4 0x0008 EHCI Host Control Capability Parameter Register (Default Value:0x0000_A026)

| Offset: 0x0008 | | | Register Name: HCCPARAMS |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15:8 | R | 0xA0 | <p>EHCI Extended Capabilities Pointer (EECP)</p> <p>This optional field indicates the existence of a capabilities list. A value of 00b indicates no extended capabilities are implemented. A non-zero value in this register indicates the offset in PCI configuration space of the first EHCI extended capability. The pointer value must be 40h or greater if implemented to maintain consistency of the PCI header defined for this class of device.</p> <p>The value of this field is always '00b'.</p> |
| 7:4 | R | 0x2 | <p>Isochronous Scheduling Threshold</p> <p>This field indicates, relative to the current position of the executing host controller, where software can reliably update the isochronous schedule.</p> <p>When bit[7] is zero, the value of the least significant 3 bits indicates the number of micro-frames a host controller can hold a set of isochronous data structures (one or more) before flushing the state. When bit[7] is a one, then host software assumes the host controller may cache an isochronous data structure for an entire frame.</p> |
| 3 | / | / | / |
| 2 | R | 0x1 | <p>Asynchronous Schedule Park Capability</p> <p>If this bit is set to a one, then the host controller supports the park feature for high-speed queue heads in the Asynchronous Schedule. The feature can be disabled or enabled and set to a specific level by using the Asynchronous Schedule Park Mode Enable and Asynchronous Schedule Park Mode Count fields in the USBCMD register.</p> |
| 1 | R | 0x1 | <p>Programmable Frame List Flag</p> <p>If this bit is set to a zero, then system software must use a frame list length of 1024 elements with this host controller. The USBCMD register Frame List Size field is a read-only register and should be set to zero.</p> <p>If set to 1, then system software can specify and use the frame list in the USBCMD register Frame List Size field to configure the host controller.</p> <p>The frame list must always align on a 4K page boundary. This requirement ensures that the frame list is always physically contiguous.</p> |
| 0 | / | / | / |

9.6.5.5 0x000C EHCI Companion Port Route Description (Default Value:0x0000_0000)

| Offset: 0x000C | | | Register Name: HCSP-PORTROUTE |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | <p>HCSP-PORTROUTE</p> <p>This optional field is valid only if Port Routing Rules field in HCSPARAMS register is set to a one.</p> <p>This field is used to allow a host controller implementation to explicitly describe to which companion host controller each implemented port is mapped. This field is a 15-element nibble array (each 4 bit is one array element). Each array location corresponds one-to-one with a physical port provided by the host controller (e.g. PORTROUTE [0] corresponds to the first PORTSC port, PORTROUTE [1] to the second PORTSC port, etc.). The value of each element indicates to which the companion host controllers this port is routed. Only the first N_PORTS elements have valid information. A value of zero indicates that the port is routed to the lowest numbered function companion host controller. A value of one indicates that the port is routed to the next lowest numbered function companion host controller, and so on.</p> |

9.6.5.6 0x0010 EHCI USB Command Register (Default Value:0x0008_0B00)

| Offset: 0x0010 | | | Register Name: USBCMD | | | | | | | | | | | | | | | | | | |

| 31:24 | / | / | / | | | | | | | | | | | | | | | | | | |
| 23:16 | R/W | 0x08 | <p>Interrupt Threshold Control</p> <p>The value in this field is used by system software to select the maximum rate at which the host controller will issue interrupts. The only valid values are defined below:</p> <table border="1" data-bbox="673 1662 1428 2094"> <thead> <tr> <th>Value</th> <th>Minimum Interrupt Interval</th> </tr> </thead> <tbody> <tr> <td>0x00</td> <td>Reserved</td> </tr> <tr> <td>0x01</td> <td>1 micro-frame</td> </tr> <tr> <td>0x02</td> <td>2 micro-frame</td> </tr> <tr> <td>0x04</td> <td>4 micro-frame</td> </tr> <tr> <td>0x08</td> <td>8 micro-frame(default, equates to 1 ms)</td> </tr> <tr> <td>0x10</td> <td>16 micro-frame(2ms)</td> </tr> <tr> <td>0x20</td> <td>32 micro-frame(4ms)</td> </tr> <tr> <td>0x40</td> <td>64 micro-frame(8ms)</td> </tr> </tbody> </table> | Value | Minimum Interrupt Interval | 0x00 | Reserved | 0x01 | 1 micro-frame | 0x02 | 2 micro-frame | 0x04 | 4 micro-frame | 0x08 | 8 micro-frame(default, equates to 1 ms) | 0x10 | 16 micro-frame(2ms) | 0x20 | 32 micro-frame(4ms) | 0x40 | 64 micro-frame(8ms) |
| Value | Minimum Interrupt Interval | | | | | | | | | | | | | | | | | | | | |
| 0x00 | Reserved | | | | | | | | | | | | | | | | | | | | |
| 0x01 | 1 micro-frame | | | | | | | | | | | | | | | | | | | | |
| 0x02 | 2 micro-frame | | | | | | | | | | | | | | | | | | | | |
| 0x04 | 4 micro-frame | | | | | | | | | | | | | | | | | | | | |
| 0x08 | 8 micro-frame(default, equates to 1 ms) | | | | | | | | | | | | | | | | | | | | |
| 0x10 | 16 micro-frame(2ms) | | | | | | | | | | | | | | | | | | | | |
| 0x20 | 32 micro-frame(4ms) | | | | | | | | | | | | | | | | | | | | |
| 0x40 | 64 micro-frame(8ms) | | | | | | | | | | | | | | | | | | | | |

| Offset: 0x0010 | | | Register Name: USBCMD |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| | | | Any other value in this register yields undefined results. The default value in this field is 0x08 . Software modifications to this bit while HC Halted bit is equal to zero results in undefined behavior. |
| 15:12 | / | / | / |
| 11 | R | 0x1 | Asynchronous Schedule Park Mode Enable (OPTIONAL) If the Asynchronous Park Capability bit in the HCCPARAMS register is a one, then this bit defaults to a 1 and is R/W. Otherwise the bit must be a zero and is Read Only. Software uses this bit to enable or disable Park mode. When this bit is one, Park mode is enabled. When this bit is zero, Park mode is disabled. |
| 10 | / | / | / |
| 9:8 | R | 0x3 | Asynchronous Schedule Park Mode Count (OPTIONAL) Asynchronous Park Capability bit in the HCCPARAMS register is a one, then this field defaults to 0x3 and is W/R. Otherwise it defaults to zero and is R. It contains a count of the number of successive transactions the host controller is allowed to execute from a high-speed queue head on the Asynchronous schedule before continuing traversal of the Asynchronous schedule. Valid value are 0x1 to 0x3. Software must not write a zero to this bit when Park Mode Enable is a one as it will result in undefined behavior. |
| 7 | R/W | 0x0 | Light Host Controller Reset (OPTIONAL) This control bit is not required. If implemented, it allows the driver to reset the EHCI controller without affecting the state of the ports or relationship to the companion host controllers. For example, the PORSTC registers should not be reset to their default values and the CF bit setting should not go to zero (retaining port ownership relationships). A host software read of this bit as zero indicates the Light Host Controller Reset has completed and it is safe for software to re-initialize the host controller. A host software read of this bit as a one indicates the Light Host |
| 6 | R/W | 0x0 | Interrupt on Async Advance Doorbell This bit is used as a doorbell by software to tell the host controller to issue an interrupt the next time it advances asynchronous schedule. Software must write a 1 to this bit to ring the doorbell. When the host controller has evicted all appropriate cached schedule state, it sets the Interrupt on Async Advance status bit in the USBSTS. if the Interrupt on Async Advance Enable bit in the |

| Offset: 0x0010 | | | Register Name: USBCMD |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 1 | R/W | 0x0 | <p>Host Controller Reset</p> <p>This control bit is used by software to reset the host controller. The effects of this on Root Hub registers are similar to a Chip Hardware Reset.</p> <p>When software writes a one to this bit, the Host Controller resets its internal pipelines, timers, counters, state machines, etc. to their initial value. Any transaction currently in progress on USB is immediately terminated. A USB reset is not driven on downstream ports.</p> <p>All operational registers, including port registers and port state machines are set to their initial values. Port ownership reverts to the companion host controller(s). Software must reinitialize the host controller as described in Section 4.1 of the CHEI Specification in order to return the host controller to an operational state.</p> <p>This bit is set to zero by the Host Controller when the reset process is complete. Software cannot terminate the reset process early by writing a zero to this register.</p> <p>Software should not set this bit to a one when the HC Halted bit in the USBSTS register is a zero. Attempting to reset an actively running host controller will result in undefined behavior.</p> |
| 0 | R/W | 0x0 | <p>Run/Stop</p> <p>When set to a 1, the Host Controller proceeds with execution of the schedule. When set to 0, the Host Controller completes the current and any actively pipelined transactions on the USB and then halts. The Host Controller must halt within 16 micro-frames after software clears this bit.</p> <p>The HC Halted bit indicates when the Host Controller has finished its pending pipelined transactions and has entered the stopped state.</p> <p>Software must not write a one to this field unless the Host Controller is in the Halt State.</p> <p>The default value is 0x0.</p> |

9.6.5.7 0x0014 EHCI USB Status Register (Default Value:0x0000_1000)

| Offset: 0x0014 | | | Register Name: USBSTS |
|----------------|------------|-------------|------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15 | R | 0x0 | Asynchronous Schedule Status |

| Offset: 0x0014 | | | Register Name: USBSTS |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| | | | The bit reports the current real status of Asynchronous Schedule. If this bit is a zero then the status of the Asynchronous Schedule is disabled. If this bit is a one then the status of the Asynchronous Schedule is enabled. The Host Controller is not required to immediately disable or enable the Asynchronous Schedule when software transitions the Asynchronous Schedule Enable bit in the USBCMD register. When this bit and the Asynchronous Schedule Enable bit are the same value, the Asynchronous Schedule is either enabled (1) or disabled (0). |
| 14 | R | 0x0 | <p>Periodic Schedule Status</p> <p>The bit reports the current real status of the Periodic Schedule. If this bit is a zero then the status of the Periodic Schedule is disabled. If this bit is a one then the status of the Periodic Schedule is enabled. The Host Controller is not required to <i>immediately</i> disable or enable the Periodic Schedule when software transitions the <i>Periodic Schedule Enable</i> bit in the USBCMD register. When this bit and the <i>Periodic Schedule Enable</i> bit are the same value, the Periodic Schedule is either enabled (1) or disabled (0).</p> |
| 13 | R | 0x0 | <p>Reclamation</p> <p>This is a read-only status bit, which is used to detect an empty asynchronous schedule.</p> |
| 12 | R | 0x1 | <p>HC Halted</p> <p>This bit is a zero whenever the Run/Stop bit is a one. The Host Controller Sets this bit to one after it has stopped executing as a result of the Run/Stop bit being set to 0, either by software or by the Host Controller Hardware (e.g. internal error). The default value is '1'.</p> |
| 11:6 | / | / | / |
| 5 | R/WC | 0x0 | <p>Interrupt on Async Advance</p> <p>System software can force the host controller to issue an interrupt the next time the host controller advances the asynchronous schedule by writing a one to the Interrupt on Async Advance Doorbell bit in the USBCMD register. This status bit indicates the assertion of that interrupt source.</p> |
| 4 | R/WC | 0x0 | <p>Host System Error</p> <p>The Host Controller set this bit to 1 when a serious error occurs during a host system access involving the Host Controller module. When this error occurs, the Host Controller clears the Run/Stop bit in the Command register to prevent further execution of the scheduled TDs.</p> |
| 3 | R/WC | 0x0 | Frame List Rollover |

| Offset: 0x0014 | | | Register Name: USBSTS |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| | | | The Host Controller sets this bit to a one when the Frame List Index rolls over from its maximum value to zero. The exact value at which the rollover occurs depends on the frame list size. For example, if the frame list size is 1024, the Frame Index Register rolls over every time FRINDEX [13] toggles. Similarly, if the size is 512, the Host Controller sets this bit to a one every time FRINDEX [12] toggles. |
| 2 | R/WC | 0x0 | <p>Port Change Detect</p> <p>The Host Controller sets this bit to a one when any port for which the Port Owner bit is set to zero has a change bit transition from a zero to a one or a Force Port Resume bit transition from a zero to a one as a result of a J-K transition detected on a suspended port. This bit will also be set as a result of the Connect Status Change being set to a one after system software has relinquished ownership of a connected port by writing a one to a port's Port Owner bit.</p> |
| 1 | R/WC | 0x0 | <p>USB Error Interrupt(USBERRINT)</p> <p>The Host Controller sets this bit to 1 when completion of USB transaction results in an error condition(e.g. error counter underflow).If the TD on which the error interrupt occurred also had its IOC bit set, both.</p> <p>This bit and USBINT bit are set.</p> |
| 0 | R/WC | 0x0 | <p>USB Interrupt(USBINT)</p> <p>The Host Controller sets this bit to a one on the completion of a USB transaction, which results in the retirement of a Transfer Descriptor that had its IOC bit set.</p> <p>The Host Controller also sets this bit to 1 when a short packet is detected (actual number of bytes received was less than the expected number of bytes)</p> |

9.6.5.8 0x0018 EHCI USB Interrupt Enable Register (Default Value:0x0000_0000)

| 8 | R/W | 0x0 | <p>Port Reset</p> <p>1=Port is in Reset. 0=Port is not in Reset. Default value = 0.</p> <p>When software writes a one to this bit (from a zero), the bus reset sequence as defined in the USB Specification Revision 2.0 is started. Software writes a zero to this bit to terminate the bus reset sequence. Software must keep this bit at a one long enough to ensure the reset sequence, as specified in the USB Specification Revision 2.0, completes.</p> <p>Note: When software writes this bit to a one , it must also write a zero to the Port Enable bit.</p> <p>Note that when software writes a zero to this bit there may be a delay before the bit status changes to a zero. The bit status will not read as a zero until after the reset has completed. If the port is in high-speed mode after reset is complete, the host controller will automatically enable this port (e.g. set the Port Enable bit to a one). A host controller must terminate the reset and stabilize the state of the port within 2 milliseconds of software transitioning this bit from a one to a zero. For example: if the port detects that the attached device is high-speed during reset, then the host controller must have the port in the enabled state with 2ms of software writing this bit to a zero.</p> | | | | | | | | | | | | | | | |

| Offset: 0x0054 | | | Register Name: PORTSC | | | | | | | | |

| Bit | Read/Write | Default/Hex | Description | | | | | | | | |
| | | | <p>The HC Halted bit in the USBSTS register should be a zero before software attempts to use this bit. The host controller may hold Port Reset asserted to a one when the HC Halted bit is a one.</p> <p>This field is zero if Port Power is zero.</p> | | | | | | | | |
| 7 | R/W | 0x0 | <p>Suspend</p> <p>Port Enabled Bit and Suspend bit of this register define the port states as follows:</p> <table border="1" data-bbox="673 622 1428 855"> <thead> <tr> <th>Bits[Port Suspend]</th> <th>Enables, Port State</th> </tr> </thead> <tbody> <tr> <td>0x</td> <td>Disable</td> </tr> <tr> <td>10</td> <td>Enable</td> </tr> <tr> <td>11</td> <td>Suspend</td> </tr> </tbody> </table> <p>When in suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction, if a transaction was in progress when this bit was written to 1. In the suspend state, the port is sensitive to resume detection. Not that the bit status does not change until the port is suspend and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB.</p> <p>A write of zero to this bit is ignored by the host controller. The host controller will unconditionally set this bit to a zero when:</p> <ol style="list-style-type: none"> ① Software sets the Force Port Resume bit to a zero(from a one). ② Software sets the Port Reset bit to a one(from a zero). <p>If host software sets this bit to a one when the port is not enabled(i.e. Port enabled bit is a zero), the results are undefined.</p> <p>This field is zero if Port Power is zero.</p> <p>The default value in this field is '0'.</p> | Bits[Port Suspend] | Enables, Port State | 0x | Disable | 10 | Enable | 11 | Suspend |
| Bits[Port Suspend] | Enables, Port State | | | | | | | | | | |
| 0x | Disable | | | | | | | | | | |
| 10 | Enable | | | | | | | | | | |
| 11 | Suspend | | | | | | | | | | |
| 6 | R/W | 0x0 | <p>Force Port Resume</p> <p>1 = Resume detected/driven on port. 0 = No resume (K-state) detected/driven on port. Default value = 0.</p> <p>This functionality defined for manipulating this bit depends on the value of the Suspend bit. For example, if the port is not suspend and software transitions this bit to a one, then the effects on the bus are undefined.</p> <p>Software sets this bit to 1 to drive resume signaling. The Host Controller sets this bit to a 1 if a J-to-K transition is detected while the port is in the Suspend state. When this bit transitions to a one because a J-to-K transition is detected, the Port Change Detect bit in the USBSTS register is also set to a one. If software sets this bit</p> | | | | | | | | |

| Offset: 0x0054 | | | Register Name: PORTSC |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| | | | <p>to a one, the host controller must not set the Port Change Detect bit.</p> <p>Note that when the EHCI controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (Full-speed 'K') is driven on the port as long as this remains a one. Software must appropriately time the Resume and set this bit to a zero when the appropriate amount of time has elapsed. Writing a zero (from one) causes the port to return high-speed mode (forcing the bus below the port into a high-speed idle). This bit will remain a one until the port has switched to high-speed idle. The host controller must complete this transition within 2 milliseconds of software setting this bit to a zero.</p> <p>This field is zero if Port Power is zero.</p> |
| 5 | R/WC | 0x0 | <p>Over-current Change</p> <p>This bit gets set to a one when there is a change to Over-current Active. Software clears this bit by writing a one to this bit position.</p> |
| 4 | R | 0x0 | <p>Over-current Active</p> <p>0 = This port does not have an over-current condition 1 = This port currently has an over-current condition</p> <p>This bit will automatically transition from a one to a zero when the over current condition is removed.</p> <p>The default value of this bit is '0'.</p> |
| 3 | R/WC | 0x0 | <p>Port Enable/Disable Change</p> <p>1 = Port enabled/disabled status has changed 0 = No change</p> <p>For the root hub, this bit gets set to a one only when a port is disabled due to the appropriate conditions existing at the EOF2 point (See Chapter 11 of the USB Specification for the definition of a Port Error). Software clears this bit by writing a 1 to it.</p> <p>This field is zero if Port Power is zero.</p> |
| 2 | R/W | 0x0 | <p>Port Enabled/Disabled</p> <p>1=Enable 0=Disable</p> <p>Ports can only be enabled by the host controller as a part of the reset and enable. Software cannot enable a port by writing a one to this field. The host controller will only set this bit to a one when the reset sequence determines that the attached device is a high-speed device.</p> |

| Offset: 0x0054 | | | Register Name: PORTSC |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| | | | <p>Ports can be disabled by either a fault condition (disconnect event or other fault condition) or by host software. Note that the bit status does not change until the port state actually changes. There may be a delay in disabling or enabling a port due to other host controller and bus events.</p> <p>When the port is disabled, downstream propagation of data is blocked on this port except for reset.</p> <p>The default value of this field is '0'.</p> <p>This field is zero if Port Power is zero.</p> |
| 1 | R/WC | 0x0 | <p>Connect Status Change</p> <p>1=Change in Current Connect Status</p> <p>0=No change</p> <p>Indicates a change has occurred in the current connect status of the port. The host controller sets this bit for all changes to the port device connect status, even if system software has not cleared an existing connect status change. For example, the insertion status changes twice before system software has cleared the changed condition, hub hardware will be "setting" an already-set bit. Software sets this bit to 0 by writing a 1 to it.</p> <p>This field is zero if Port Power is zero.</p> |
| 0 | R | 0x0 | <p>Current Connect Status</p> <p>Device is present on port when the value of this field is a one, and no device is present on port when the value of this field is a zero. This value reflects the current state of the port, and may not correspond directly to the event that caused the Connect Status Change (Bit 1) to be set.</p> <p>This field is zero if Port Power zero.</p> |

NOTE

This register is only reset by hardware or in response to a host controller reset.

9.6.6 OHCI Register Description

|----------------|----------------|-----|-------------|---|-----|----------|-----|-----------|-----|----------------|-----|------------|
| Bit | Read/Write | | Default/Hex | Description | | | | | | | | |
| | HCD | HC | | | | | | | | | | |
| 31:11 | / | / | / | / | | | | | | | | |
| 10 | R/W | R | 0x0 | <p>RemoteWakeupEnable</p> <p>This bit is used by HCD to enable or disable the remote wakeup feature upon the detection of upstream resume signaling. When this bit is set and the ResumeDetected bit in HcInterruptStatus is set, a remote wakeup is signaled to the host system. Setting this bit has no impact on the generation of hardware interrupt.</p> | | | | | | | | |
| 9 | R/W | R/W | 0x0 | <p>RemoteWakeupConnected</p> <p>This bit indicates whether HC supports remote wakeup signaling. If remote wakeup is supported and used by the system, it is the responsibility of system firmware to set this bit during POST. HC clear the bit upon a hardware reset but does not alter it upon a software reset. Remote wakeup signaling of the host system is host-bus-specific and is not described in this specification.</p> | | | | | | | | |
| 8 | R/W | R | 0x0 | <p>InterruptRouting</p> <p>This bit determines the routing of interrupts generated by events registered in HcInterruptStatus. If clear, all interrupt are routed to the normal host bus interrupt mechanism. If set interrupts are routed to the System Management Interrupt. HCD clears this bit upon a hardware reset, but it does not alter this bit upon a software reset. HCD uses this bit as a tag to indicate the ownership of HC.</p> | | | | | | | | |
| 7:6 | R/W | R/W | 0x0 | <p>HostControllerFunctionalState for USB</p> <table border="1"> <tr> <td>00b</td> <td>USBReset</td> </tr> <tr> <td>01b</td> <td>USBResume</td> </tr> <tr> <td>10b</td> <td>USBOperational</td> </tr> <tr> <td>11b</td> <td>USBSuspend</td> </tr> </table> <p>A transition to USBOperational from another state causes SOF generation to begin 1 ms later. HCD may determine whether HC has begun sending SOFs by reading the StartoFrame field of HcInterruptStatus.</p> <p>This field may be changed by HC only when in the USBSUSPEND state. HC may move from the USBSUSPEND state to the USBRESUME state after detecting the resume signaling from a downstream port.</p> <p>HC enters USBSUSPEND after a software reset, whereas it enters USBRESET after a hardware reset. The latter also resets the Root</p> | 00b | USBReset | 01b | USBResume | 10b | USBOperational | 11b | USBSuspend |

| | HCD | HC | | | | | | |
| | | | | Hub and asserts subsequent reset signaling to downstream ports. | | | | |
| 5 | R/W | R | 0x0 | <p>BulkListEnable</p> <p>This bit is set to enable the processing of the Bulk list in the next Frame. If cleared by HCD, the processing of the Bulk list does not occur after the next SOF. HC checks this bit whenever it determines to process the list. When disabled, HCD may modify the list. If <i>HcBulkCurrentED</i> is pointing to an ED to be removed, HCD must advance the pointer by updating <i>HcBulkCurrentED</i> before re-enabling processing of the list.</p> | | | | |
| 4 | R/W | R | 0x0 | <p>ControlListEnable</p> <p>This bit is set to enable the processing of the Control list in the next Frame. If cleared by HCD, the processing of the Control list does not occur after the next SOF. HC must check this bit whenever it determines to process the list. When disabled, HCD may modify the list. If <i>HcControlCurrentED</i> is pointing to an ED to be removed, HCD must advance the pointer by updating <i>HcControlCurrentED</i> before re-enabling processing of the list.</p> | | | | |
| 3 | R/W | R | 0x0 | <p>IsochronousEnable</p> <p>This bit is used by HCD to enable/disable processing of isochronous EDs. While processing the periodic list in a Frame, HC checks the status of this bit when it finds an Isochronous ED (F=1). If set (enabled), HC continues processing the EDs. If cleared (disabled), HC halts processing of the periodic list (which now contains only isochronous EDs) and begins processing the Bulk/Control lists. Setting this bit is guaranteed to take effect in the next Frame (not the current Frame).</p> | | | | |
| 2 | R/W | R | 0x0 | <p>PeriodicListEnable</p> <p>This bit is set to enable the processing of periodic list in the next Frame. If cleared by HCD, processing of the periodic list does not occur after the next SOF. HC must check this bit before it starts processing the list.</p> | | | | |
| 1:0 | R/W | R | 0x0 | <p>ControlBulkServiceRatio</p> <p>This specifies the service ratio between Control and Bulk EDs. Before processing any of the nonperiodic lists, HC must compare the ratio specified with its internal count on how many nonempty Control EDs have been processed, in determining whether to continue serving another Control ED or switching to Bulk EDs. The internal count will be retained when crossing the frame boundary. In case of reset, HCD is responsible for restoring this value.</p> <table border="1" data-bbox="671 1977 1426 2067"> <thead> <tr> <th>CBSR</th> <th>No. of Control EDs Over Bulk EDs Served</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>1:1</td> </tr> </tbody> </table> | CBSR | No. of Control EDs Over Bulk EDs Served | 0 | 1:1 |

9.6.6.2 0x0408 OHCI Command Status Register (Default Value: 0x0000_0000)

| Offset: 0x0408 | | | Register Name: HcCommandStatus | |
|----------------|------------|-----|--------------------------------|--|
| Bit | Read/Write | | Default/Hex | Description |
| | HCD | HC | | |
| 31:18 | / | / | 0x0 | Reserved |
| 17:16 | R | R/W | 0x0 | SchedulingOverrunCount These bits are incremented on each scheduling overrun error. It is initialized to 00b and wraps around at 11b. This will be incremented when a scheduling overrun is detected even if SchedulingOverrun in <i>HcInterruptStatus</i> has already been set. This is used by HCD to monitor any persistent scheduling problem. |
| 15:4 | / | / | / | / |
| 3 | R/W | R/W | 0x0 | OwenshipChangeRequest This bit is set by an OS HCD to request a change of control of the HC. When set HC will set the OwnershipChange field in <i>HcInterruptStatus</i> . After the changeover, this bit is cleared and remains so until the next request from OS HCD. |
| 2 | R/W | R/W | 0x0 | BulkListFilled This bit is used to indicate whether there are any TDs on the Bulk list. It is set by HCD whenever it adds a TD to an ED in the Bulk list. When HC begins to process the head of the Bulk list, it checks BLF. As long as BulkListFilled is 0, HC will not start processing the Bulk list. If BulkListFilled is 1, HC will start processing the Bulk list and will set BF to 0. If HC finds a TD on the list, then HC will set BulkListFilled to 1 causing the Bulk list processing to continue. If no TD is found on the Bulk list, and if HCD does not set BulkListFilled , then BulkListFilled will still be 0 when HC completes processing the Bulk list and Bulk list processing will stop. |
| 1 | R/W | R/W | 0x0 | ControlListFilled This bit is used to indicate whether there are any TDs on the Control list. It is set by HCD whenever it adds a TD to an ED in the Control list. When HC begins to process the head of the Control list, it checks |

| Offset: 0x0408 | | | Register Name: HcCommandStatus | |
|----------------|------------|-----|--------------------------------|--|
| Bit | Read/Write | | Default/Hex | Description |
| | HCD | HC | | |
| | | | | CLF. As long as ControlListFilled is 0, HC will not start processing the Control list. If CF is 1, HC will start processing the Control list and will set ControlListFilled to 0. If HC finds a TD on the list, then HC will set ControlListFilled to 1 causing the Control list processing to continue. If no TD is found on the Control list, and if the HCD does not set ControlListFilled , then ControlListFilled will still be 0 when HC completes processing the Control list and Control list processing will stop. |
| 0 | R/W | R/E | 0x0 | HostControllerReset This bit is by HCD to initiate a software reset of HC. Regardless of the functional state of HC, it moves to the USBsuspend state in which most of the operational registers are reset except those stated otherwise; e.g, the InterruptRouting field of HcControl, and no Host bus accesses are allowed. This bit is cleared by HC upon the completion of the reset operation. The reset operation must be completed within 10 ms. This bit, when set, should not cause a reset to the Root Hub and no subsequent reset signaling should be asserted to its downstream ports. |

9.6.6.3 0x040C OHCI Interrupt Status Register (Default Value: 0x0000_0000)

| Offset: 0x040C | | | Register Name: HcInterruptStatus | |
|----------------|------------|-----|----------------------------------|--|
| Bit | Read/Write | | Default/Hex | Description |
| | HCD | HC | | |
| 31:7 | / | / | / | / |
| 6 | R/W | R/W | 0x0 | RootHubStatusChange This bit is set when the content of <i>HcRhStatus</i> or the content of any of <i>HcRhPortStatus[NumberOfDownstreamPort]</i> has changed. |
| 5 | R/W | R/W | 0x0 | FrameNumberOverflow This bit is set when the MSb of <i>HcFmNumber</i> (bit 15) changes value, from 0 to 1 or from 1 to 0, and after <i>HccaFrameNumber</i> has been updated. |
| 4 | R/W | R/W | 0x0 | UnrecoverableError This bit is set when HC detects a system error not related to USB. HC should not proceed with any processing nor signaling before the system error has been corrected. HCD clears this bit after HC has been reset. |
| 3 | R/W | R/W | 0x0 | ResumeDetected This bit is set when HC detects that a device on the USB is asserting resume signaling. It is the transition from no resume signaling to |

| Offset: 0x040C | | | | Register Name: HcInterruptStatus |
|----------------|------------|-----|-------------|---|
| Bit | Read/Write | | Default/Hex | Description |
| | HCD | HC | | |
| | | | | resume signaling causing this bit to be set. This bit is not set when HCD sets the USBResume state. |
| 2 | R/W | R/W | 0x0 | StartofFrame This bit is set by HC at each start of frame and after the update of HccaFrameNumber. HC also generates a SOF token at the same time. |
| 1 | R/W | R/W | 0x0 | WritebackDoneHead This bit is set immediately after HC has written HcDoneHead to HccaDoneHead. Further updates of the HccaDoneHead will not occur until this bit has been cleared. HCD should only clear this bit after it has saved the content of HccaDoneHead. |
| 0 | R/W | R/W | 0x0 | SchedulingOverrun This bit is set when the USB schedule for the current Frame overruns and after the update of HccaFrameNumber. A scheduling overrun will also cause the SchedulingOverrunCount of HcCommandStatus to be incremented. |

9.6.6.4 0x0410 OHCI Interrupt Enable Register (Default Value: 0x0000_0000)

| | | | | 0 | Ignore; |
| | | | | 1 | Disable interrupt generation due to Scheduling Overrun; |

9.6.6.6 0x0418 OHCI HCCA Register (Default Value: 0x0000_0000)

| Offset: 0x0418 | | | | Register Name: HcHCCA | |
|----------------|------------|----|-------------|---|--|
| Bit | Read/Write | | Default/Hex | Description | |
| | HCD | HC | | | |
| 31:8 | R/W | R | 0x0 | HCCA[31:8] This is the base address of the Host Controller Communication Area. This area is used to hold the control structures and the Interrupt table that are accessed by both the Host Controller and the Host Controller Driver. | |
| 7:0 | R | R | 0x0 | HCCA[7:0] The alignment restriction in HcHCCA register is evaluated by examining the number of zeros in the lower order bits. The minimum alignment is 256 bytes, therefore, bits 0 through 7 must always return 0 when read. | |

9.6.6.7 0x041C OHCI Period Current ED Register (Default Value: 0x0000_0000)

| Offset: 0x041C | | | | Register Name: HcPeriodCurrentED[PCED] | |
|----------------|------------|-----|-------------|--|--|
| Bit | Read/Write | | Default/Hex | Description | |
| | HCD | HC | | | |
| 31:4 | R | R/W | 0x0 | PCED[31:4] This is used by HC to point to the head of one of the Periodic list which will be processed in the current Frame. The content of this register is updated by HC after a periodic ED has been processed. HCD may read the content in determining which ED is currently being processed at the time of reading. | |
| 3:0 | R | R | 0x0 | PCED[3:0] Because the general TD length is 16 bytes, the memory structure for the TD must be aligned to a 16-byte boundary. So the lower bits in the PCED, through bit 0 to bit 3 must be zero in this field. | |

9.6.6.8 0x0420 OHCI Control Head ED Register (Default Value: 0x0000_0000)

| Offset: 0x0420 | | | | Register Name: HcControlHeadED[CHED] |
|----------------|------------|----|-------------|--|
| Bit | Read/Write | | Default/Hex | Description |
| | HCD | HC | | |
| 31:4 | R/W | R | 0x0 | EHCD[31:4] The HcControlHeadED register contains the physical address of the first Endpoint Descriptor of the Control list. HC traverse the Control list starting with the HcControlHeadED pointer. The content is loaded from HCCA during the initialization of HC. |
| 3:0 | R | R | 0x0 | EHCD[3:0] Because the general TD length is 16 bytes, the memory structure for the TD must be aligned to a 16-byte boundary. So the lower bits in the PCED, through bit 0 to bit 3 must be zero in this field. |

9.6.6.9 0x0424 OHCI Control Current ED Register (Default Value: 0x0000_0000)

| Offset: 0x0424 | | | | Register Name: HcControlCurrentED[CCED] |
|----------------|------------|-----|-------------|---|
| Bit | Read/Write | | Default/Hex | Description |
| | HCD | HC | | |
| 31:4 | R/W | R/W | 0x0 | CCED[31:4] The pointer is advanced to the next ED after serving the present one. HC will continue processing the list from where it left off in the last Frame. When it reaches the end of the Control list, HC checks the ControlListFilled of in HcCommandStatus. If set, it copies the content of HcControlHeadED to HcControlCurrentED and clears the bit. If not set, it does nothing. HCD is allowed to modify this register only when the ControlListEnable of HcControl is cleared. When set, HCD only reads the instantaneous value of this register. Initially, this is set to zero to indicate the end of the Control list. |
| 3:0 | R | R | 0x0 | CCED[3:0] Because the general TD length is 16 bytes, the memory structure for the TD must be aligned to a 16-byte boundary. So the lower bits in the PCED, through bit 0 to bit 3 must be zero in this field. |

9.6.6.10 0x0428 OHCI Bulk Head ED Register (Default Value: 0x0000_0000)

| Offset: 0x0428 | | | Register Name: HcBulkHeadED[BHED] | |
|----------------|------------|----|-----------------------------------|---|
| Bit | Read/Write | | Default/Hex | Description |
| | HCD | HC | | |
| 31:4 | R/W | R | 0x0 | BHED[31:4] The HcBulkHeadED register contains the physical address of the first Endpoint Descriptor of the Bulk list. HC traverses the Bulk list starting with the HcBulkHeadED pointer. The content is loaded from HCCA during the initialization of HC. |
| 3:0 | R | R | 0x0 | BHED[3:0] Because the general TD length is 16 bytes, the memory structure for the TD must be aligned to a 16-byte boundary. So the lower bits in the PCED, through bit 0 to bit 3 must be zero in this field. |

9.6.6.11 0x042C OHCI Bulk Current ED Register (Default Value: 0x0000_0000)

| Offset: 0x042C | | | Register Name: HcBulkCurrentED[BCED] | |
|----------------|------------|-----|--------------------------------------|---|
| Bit | Read/Write | | Default/Hex | Description |
| | HCD | HC | | |
| 31:4 | R/W | R/W | 0x0 | BulkCurrentED[31:4] This is advanced to the next ED after the HC has served the present one. HC continues processing the list from where it left off in the last Frame. When it reaches the end of the Bulk list, HC checks the ControlListFilled of HcControl. If set, it copies the content of HcBulkHeadED to HcBulkCurrentED and clears the bit. If it is not set, it does nothing. HCD is only allowed to modify this register when the BulkListEnable of HcControl is cleared. When set, the HCD only reads the instantaneous value of this register. This is initially set to zero to indicate the end of the Bulk list. |
| 3:0 | R | R | 0x0 | BulkCurrentED [3:0] Because the general TD length is 16 bytes, the memory structure for the TD must be aligned to a 16-byte boundary. So the lower bits in the PCED, through bit 0 to bit 3 must be zero in this field. |

9.6.6.12 0x0430 OHCI Done Head Register (Default Value: 0x0000_0000)

| Offset: 0x0430 | | | Register Name: HcDoneHead | |
|----------------|------------|-----|---------------------------|---|
| Bit | Read/Write | | Default/Hex | Description |
| | HCD | HC | | |
| 31:4 | R | R/W | 0x0 | HcDoneHead[31:4] When a TD is completed, HC writes the content of HcDoneHead to |

| Offset: 0x0430 | | | Register Name: HcDoneHead | |
|----------------|------------|----|---------------------------|---|
| Bit | Read/Write | | Default/Hex | Description |
| | HCD | HC | | |
| | | | | the NextTD field of the TD. HC then overwrites the content of <i>HcDoneHead</i> with the address of this TD. This is set to zero whenever HC writes the content of this register to HCCA. It also sets the WritebackDoneHead of <i>HcInterruptStatus</i> . |
| 3:0 | R | R | 0x0 | HcDoneHead[3:0] Because the general TD length is 16 bytes, the memory structure for the TD must be aligned to a 16-byte boundary. So the lower bits in the PCED, through bit 0 to bit 3 must be zero in this field. |

9.6.6.13 0x0434 OHCI Frame Interval Register (Default Value: 0x0000_2EDF)

| Offset: 0x0434 | | | Register Name: HcFmInterval Register | |
|----------------|------------|----|--------------------------------------|---|
| Bit | Read/Write | | Default/Hex | Description |
| | HCD | HC | | |
| 31 | R/W | R | 0x0 | FrameIntervalToggler HCD toggles this bit whenever it loads a new value to FrameInterval . |
| 30:16 | R/W | R | 0x0 | FSLargestDataPacket This field specifies a value which is loaded into the Largest Data Packet Counter at the beginning of each frame. The counter value represents the largest amount of data in bits which can be sent or received by the HC in a single transaction at any given time without causing scheduling overrun. The field value is calculated by the HCD. |
| 15:14 | / | / | / | / |
| 13:0 | R/W | R | 0x2edf | FrameInterval This specifies the interval between two consecutive SOFs in bit times. The nominal value is set to be 11,999. HCD should store the current value of this field before resetting HC. By setting the HostControllerReset field of <i>HcCommandStatus</i> as this will cause the HC to reset this field to its nominal value. HCD may choose to restore the stored value upon the completion of the Reset sequence. |

9.6.6.14 0x0438 OHCI Frame Remaining Register (Default Value: 0x0000_0000)

| Offset: 0x0438 | | | Register Name: HcFmRemaining | |
|----------------|------------|-----|------------------------------|--|
| Bit | Read/Write | | Default/Hex | Description |
| | HCD | HC | | |
| 31 | R | R/W | 0x0 | FrameRemaining Toggle This bit is loaded from the FrameIntervalToggle field of <i>HcFmInterval</i> whenever FrameRemaining reaches 0. This bit is used by HCD for the synchronization between FrameInterval and FrameRemaining . |
| 30:14 | / | / | / | / |
| 13:0 | R | RW | 0x0 | FramRemaining This counter is decremented at each bit time. When it reaches zero, it is reset by loading the FrameInterval value specified in <i>HcFmInterval</i> at the next bit time boundary. When entering the USBOPERATIONAL state, HC re-loads the content with the FrameInterval of <i>HcFmInterval</i> and uses the updated value from the next SOF. |

9.6.6.15 0x043C OHCI Frame Number Register (Default Value: 0x0000_0000)

| Offset: 0x043C | | | Register Name: HcFmNumber | |
|----------------|------------|-----|---------------------------|---|
| Bit | Read/Write | | Default/Hex | Description |
| | HCD | HC | | |
| 31:16 | / | / | / | / |
| 15:0 | R | R/W | 0x0 | FrameNumber This is incremented when <i>HcFmRemaining</i> is re-loaded. It will be rolled over to 0x0 after 0x0ffff. When entering the USBOPERATIONAL state, this will be incremented automatically. The content will be written to HCCA after HC has incremented the FrameNumber at each frame boundary and sent a SOF but before HC reads the first ED in that Frame. After writing to HCCA, HC will set the StartofFrame in <i>HcInterruptStatus</i> . |

9.6.6.16 0x0440 OHCI Periodic Start Register (Default Value: 0x0000_0000)

| Offset: 0x0440 | | | Register Name: HcPeriodicStatus | |
|----------------|------------|----|---------------------------------|--|
| Bit | Read/Write | | Default/Hex | Description |
| | HCD | HC | | |
| 31:14 | / | / | / | / |
| 13:0 | R/W | R | 0x0 | PeriodicStart After a hardware reset, this field is cleared. This is then set by HCD |

| Offset: 0x0440 | | | Register Name: HcPeriodicStatus | |
|----------------|------------|----|---------------------------------|--|
| Bit | Read/Write | | Default/Hex | Description |
| | HCD | HC | | |
| | | | | during the HC initialization. The value is calculated roughly as 10% off from <i>HcFmInterval</i> . A typical value will be 0x2A3F (or 0x3e67). When <i>HcFmRemaining</i> reaches the value specified, processing of the periodic lists will have priority over Control/Bulk processing. HC will therefore start processing the Interrupt list after completing the current Control or Bulk transaction that is in progress. |

9.6.6.17 0x0444 OHCI LS Threshold Register (Default Value: 0x0000_0628)

| Offset: 0x0444 | | | Register Name: HcLSThreshold | |

| Offset: 0x0450 | | | | Register Name: HcRhStatus Register |
|----------------|------------|----|-------------|---|
| Bit | Read/Write | | Default/Hex | Description |
| | HCD | HC | | |
| 31 | W | R | 0x0 | <p>(write)ClearRemoteWakeupEnable</p> <p>Write a '1' clears DeviceRemoteWakeupEnable. Writing a '0' has no effect.</p> |
| 30:18 | / | / | / | / |
| 17 | R/W | R | 0x0 | <p>OverCurrentIndicatorChang</p> <p>This bit is set by hardware when a change has occurred to the OverCurrentIndicator field of this register. The HCD clears this bit by writing a '1'. Writing a '0' has no effect.</p> |
| 16 | R/W | R | 0x0 | <p>(read)LocalPowerStartusChange</p> |

| Offset: 0x0450 | | | Register Name: HcRhStatus Register | | | | | |
|----------------|--|-----|------------------------------------|--|---|--|---|--|
| Bit | Read/Write | | Default/Hex | Description | | | | |
| | HCD | HC | | | | | | |
| | | | | <p>The Root Hub does not support the local power status features, thus, this bit is always read as '0'.</p> <p>(write)SetGlobalPower In global power mode (PowerSwitchingMode=0), This bit is written to '1' to turn on power to all ports (clear PortPowerStatus). In per-port power mode, it sets PortPowerStatus only on ports whose PortPowerControlMask bit is not set. Writing a '0' has no effect.</p> | | | | |
| 15 | R/W | R | 0x0 | <p>(read)DeviceRemoteWakeupEnable This bit enables a ConnectStatusChange bit as a resume event, causing a USBsuspend to USBResume state transition and setting the ResumeDetected interrupt.</p> <table border="1"> <tr> <td>0</td> <td>ConnectStatusChange is not a remote wakeup event.</td> </tr> <tr> <td>1</td> <td>ConnectStatusChange is a remote wakeup event.</td> </tr> </table> <p>(write)SetRemoteWakeupEnable Writing a '1' sets DeviceRemoveWakeupEnable. Writing a '0' has no effect.</p> | 0 | ConnectStatusChange is not a remote wakeup event. | 1 | ConnectStatusChange is a remote wakeup event. |
| 0 | ConnectStatusChange is not a remote wakeup event. | | | | | | | |
| 1 | ConnectStatusChange is a remote wakeup event. | | | | | | | |
| 14:2 | / | / | / | / | | | | |
| 1 | R | R/W | 0x0 | <p>OverCurrentIndicator This bit reports overcurrent conditions when the global reporting is implemented. When set, an overcurrent condition exists. When cleared, all power operations are normal. If per-port overcurrent protection is implemented this bit is always '0'</p> | | | | |
| 0 | R/W | R | 0x0 | <p>(Read)LocalPowerStatus When read, this bit returns the LocalPowerStatus of the Root Hub. The Root Hub does not support the local power status feature; thus, this bit is always read as '0'.</p> <p>(Write)ClearGlobalPower When write, this bit is operated as the ClearGlobalPower. In global power mode (PowerSwitchingMode=0), This bit is written to '1' to turn off power to all ports (clear PortPowerStatus). In per-port power mode, it clears PortPowerStatus only on ports whose PortPowerControlMask bit is not set. Writing a '0' has no effect.</p> | | | | |

9.6.6.21 0x0454 HcRhPortStatus Register (Default Value: 0x0000_0100)

| Offset: 0x0454 | | | | Register Name: HcRhPortStatus |
|---|--|-----|-------------|--|
| Bit | Read/Write | | Default/Hex | Description |
| | HCD | HC | | |
| 31:21 | / | / | / | / |
| 20 | R/W | R/W | 0x0 | PortResetStatusChange This bit is set at the end of the 10-ms port reset signal. The HCD writes a '1' to clear this bit. Writing a '0' has no effect. |
| | | | | <table border="1"> <tr> <td>0</td> <td>port reset is not complete</td> </tr> <tr> <td>1</td> <td>port reset is complete</td> </tr> </table> |
| 0 | port reset is not complete | | | |
| 1 | port reset is complete | | | |
| 19 | R/W | R/W | 0x0 | PortOverCurrentIndicatorChange This bit is valid only if overcurrent conditions are reported on a per-port basis. This bit is set when Root Hub changes the PortOverCurrentIndicator bit. The HCD writes a '1' to clear this bit. Writing a '0' has no effect. |
| | | | | <table border="1"> <tr> <td>0</td> <td>no change in PortOverCurrentIndicator</td> </tr> <tr> <td>1</td> <td>PortOverCurrentIndicator has changed</td> </tr> </table> |
| 0 | no change in PortOverCurrentIndicator | | | |
| 1 | PortOverCurrentIndicator has changed | | | |
| 18 | R/W | R/W | 0x0 | PortSuspendStatusChange This bit is set when the full resume sequence has been completed. This sequence includes the 20-s resume pulse, LS EOP, and 3-ms resynchronization delay. The HCD writes a '1' to clear this bit. Writing a '0' has no effect. This bit is also cleared when ResetStatusChange is set. |
| | | | | <table border="1"> <tr> <td>0</td> <td>resume is not completed</td> </tr> <tr> <td>1</td> <td>resume completed</td> </tr> </table> |
| 0 | resume is not completed | | | |
| 1 | resume completed | | | |
| 17 | R/W | R/W | 0x0 | PortEnableStatusChange This bit is set when hardware events cause the PortEnableStatus bit to be cleared. Changes from HCD writes do not set this bit. The HCD writes a '1' to clear this bit. Writing a '0' has no effect. |
| | | | | <table border="1"> <tr> <td>0</td> <td>no change in PortEnableStatus</td> </tr> <tr> <td>1</td> <td>change in PortEnableStatus</td> </tr> </table> |
| 0 | no change in PortEnableStatus | | | |
| 1 | change in PortEnableStatus | | | |
| 16 | R/W | R/W | 0x0 | ConnectStatusChange This bit is set whenever a connect or disconnect event occurs. The HCD writes a '1' to clear this bit. Writing a '0' has no effect. If CurrentConnectStatus is cleared when a SetPortReset , SetPortEnable , or SetPortSuspend write occurs, this bit is set to force the driver to re-evaluate the connection status since these writes should not occur if the port is disconnected. |
| | | | | <table border="1"> <tr> <td>0</td> <td>no change in PortEnableStatus</td> </tr> <tr> <td>1</td> <td>change in PortEnableStatus</td> </tr> </table> |
| 0 | no change in PortEnableStatus | | | |
| 1 | change in PortEnableStatus | | | |
| Note: If the DeviceRemovable[NDP] bit is set, this bit is set only | | | | |

| Offset: 0x0454 | | | | Register Name: HcRhPortStatus | | | | |
|----------------|----------------------------|-----|-------------|---|---|----------------------------|---|---------------------------|
| Bit | Read/Write | | Default/Hex | Description | | | | |
| | HCD | HC | | | | | | |
| | | | | after a Root Hub reset to inform the system that the device is attached. | | | | |
| 15:10 | / | / | / | / | | | | |
| 9 | R/W | R/W | 0x0 | <p>(read)LowSpeedDeviceAttached This bit indicates the speed of the device attached to this port. When set, a Low Speed device is attached to this port. When clear, a Full Speed device is attached to this port. This field is valid only when the CurrentConnectStatus is set.</p> <table border="1"> <tr> <td>0</td> <td>full speed device attached</td> </tr> <tr> <td>1</td> <td>low speed device attached</td> </tr> </table> <p>(write)ClearPortPower The HCD clears the PortPowerStatus bit by writing a '1' to this bit. Writing a '0' has no effect.</p> | 0 | full speed device attached | 1 | low speed device attached |
| 0 | full speed device attached | | | | | | | |
| 1 | low speed device attached | | | | | | | |
| 8 | R/W | R/W | 0x1 | <p>(read)PortPowerStatus This bit reflects the port's power status, regardless of the type of power switching implemented. This bit is cleared if an overcurrent condition is detected. HCD sets this bit by writing SetPortPower or SetGlobalPower. HCD clears this bit by writing ClearPortPower or ClearGlobalPower. Which power control switches are enabled is determined by PowerSwitchingMode and PortPortControlMask[NumberDownstreamPort]. In global switching mode(PowerSwitchingMode=0), only Set/ClearGlobalPower controls this bit. In per-port power switching (PowerSwitchingMode=1), if the PortPowerControlMask[NDP] bit for the port is set, only Set/ClearPortPower commands are enabled. If the mask is not set, only Set/ClearGlobalPower commands are enabled. When port power is disabled, CurrentConnectStatus, PortEnableStatus, PortSuspendStatus, and PortResetStatus should be reset.</p> <table border="1"> <tr> <td>0</td> <td>port power is off</td> </tr> <tr> <td>1</td> <td>port power is on</td> </tr> </table> <p>(write)SetPortPower The HCD writes a '1' to set the PortPowerStatus bit. Writing a '0' has no effect.</p> <p>Note: This bit is always reads '1b' if power switching is not supported.</p> | 0 | port power is off | 1 | port power is on |

9.7 GPIO

9.7.1 Overview

The general purpose input/output (GPIO) is one of the blocks controlling the chip multiplexing pins. The D1 supports 6 groups of GPIO pins. Each pin can be configured as input or output and these pins are used to generate input signals or output signals for special purposes.

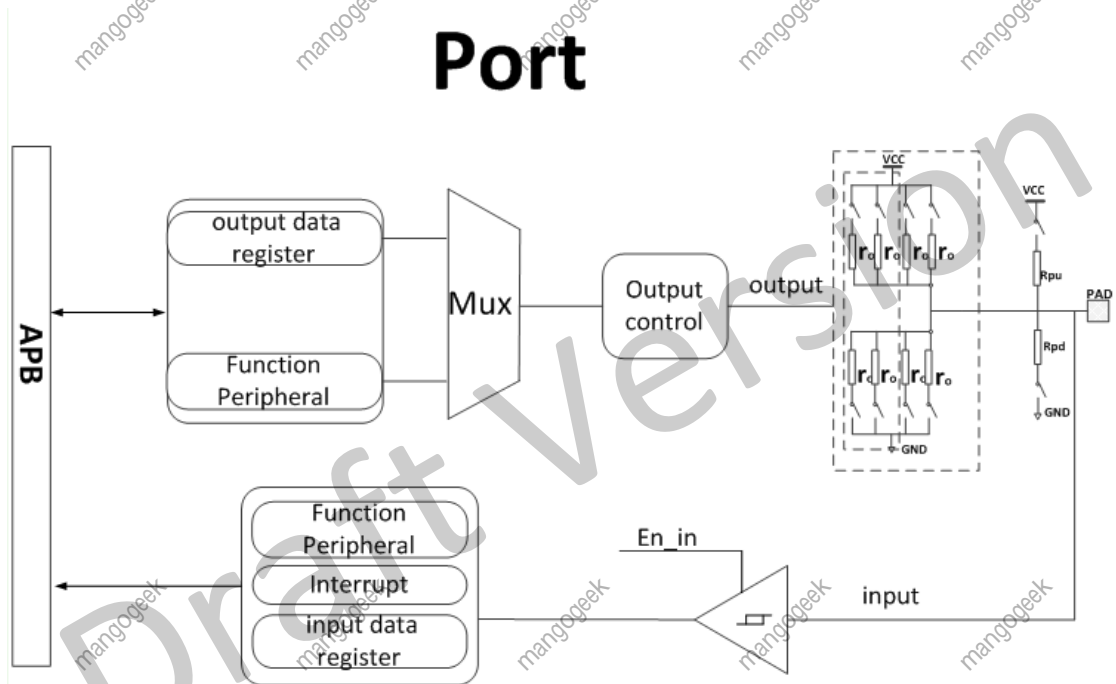

The Port Controller has the following features:

- 6 groups of ports (PB, PC, PD, PE, PF, PG)
- Software control for each signal pin
- Data input (capture)/output (drive)
- Each GPIO peripheral can produce an interrupt
- Pull-up/Pull-down/no-Pull register control
- Control the direction of every signal
- 4 drive strengths in each operating mode
- Up to 88 interrupts
- Configurable interrupt edges

9.7.2 Block Diagram

The following figure shows the block diagram of the GPIO.

Figure 9-67 GPIO Block Diagram

The GPIO consists of the digital part (GPIO, external interface) and IO analog part (output buffer, dual pull down, pad). The digital part can select the output interface by the MUX switch; the analog part can configure pull up/down and buffer strength.

When executing GPIO read state, the GPIO reads the current level of the pin into the internal register bus. When not executing GPIO read state, the external pin and the internal register bus are off-status, which is high-impedance.

9.7.3 Functional Description

9.7.3.1 Multi-function Port

The D1 includes 88 multi-functional input/output port pins. There are 6 ports as listed below.

Table 9-20 Multi-function Port

| Port Name | Number of Pins | Input Driver | Output Driver | Multiplex Pins | Power |
|-----------|----------------|--------------|---------------|--|-----------------|
| PB | 13 | Schmitt | CMOS | LCD/DMIC/OWA/I2S/TWI/PWM/IR/SPI/ UART/PB-EINT | 3.3 V |
| PC | 8 | Schmitt | CMOS | SPI/SMHC/UART/BOOT/TWI/TCON/LEDC/ PC-EINT | 3.3 V/ 1.8 V |

| Port Name | Number of Pins | Input Driver | Output Driver | Multiplex Pins | Power |
|-----------|----------------|--------------|---------------|--|---------------------------|
| PD | 23 | Schmitt | CMOS | LCD/LVDS/OWA/TWI/IR/DSI/SPI-DBI/ DMIC/UART/PWM/IR/PD-EINT | 3.3 V/ 1.8 V |
| PE | 18 | Schmitt | CMOS | NCSI/TWI/UART/PWM/LCD/OWA/LEDC/IR /JTAG/EMAC/PE-EINT | 3.3 V/ 2.8 V/ 1.8 V |
| PF | 7 | Schmitt | CMOS | SMHC/JTAG/UART/OWA/TWI/IR/I2S/LEDC /PWM/PF-EINT | 3.3 V/ 1.8 V |
| PG | 19 | Schmitt | CMOS | SMHC/UART/PWM/I2S/TWI/EMAC/OWA/ IR/TCON/LEDC/SPI/PG-EINT | 3.3 V/ 1.8 V |

9.7.3.2 GPIO Multiplex Function

Table 9-21 to Table 9-26 show the multiplex function pins of the D1.

NOTE

For each GPIO, Function0 is input function; Function1 is output function; Function9 to Function13 are reserved.

Table 9-21 PB Multiplex Function

| GPIO Port | Function 2 | Function 3 | Function 4 | Function 5 | Function 6 | Function 7 | Function 8 | Function 14 |

Draft Version

9.7.3.3 Port Function

The Port Controller supports 6 GPIOs, every GPIO can configure as Input, Output, Function Peripheral, IO disable or Interrupt function. The configuration instruction of every function is as follows.

Table 9-27 Port Function

| | Function | Buffer Strength | Pull Up | Pull Down |
|-----------|--------------------------|-----------------|---------|-----------|
| Input | GPIO/Multiplexing Input | / | X | X |
| Output | GPIO/Multiplexing Output | Y | X | X |
| Disable | Pull Up | / | Y | N |
| | Pull Down | / | N | Y |
| Interrupt | Trigger | / | X | X |

/: non-configure, configuration is invalid

Y: configure

X: Select configuration according to the actual situation

N: Forbid to configure

9.7.3.4 Pull Up/Down and High-Impedance Logic

Each IO pin can configure the internal pull-up/down function or high-impedance.

Figure 9-68 Pull up/down Logic

High-impedance, the output is float state, all buffer is off, the level is decided by external high/low level. When high-impedance, the software configures the switch on Rpu and Rpd as off, and the multiplexing function of IO is set as IO disable or input by software.

Pull-up, an uncertain signal is pulled high by resistance, the resistance has a current-limiting function. When pulling up, the switch on Rpu is conducted by software configuration, the IO is pulled up to VCC by Rpu.

Pull-down, an uncertain signal is pulled low by a resistance. When pulling down, the switch on Rpd is conducted by software configuration, the IO is pulled down to GND by Rpd.

The pull-up/down of each IO is weak pull-up/down.

The setting of pull-down, pull-up, high-impedance is decided by the external circuit.

9.7.3.5 Buffer Strength

Each IO can be set as different buffer strength. The IO buffer diagram is as follows.

Figure 9-69 IO Buffer Strength Diagram

When output high level, the n0, n1, n2, n3 of NMOS is off, the p0, p1, p2, p3 of PMOS is on. When the buffer strength is set to 0 (buffer strength is weakest), only the p0 is on, the output impedance is maximum, the impedance value is r_0 . When the buffer strength is set to 1, only the p0 and p1 is on, the output impedance is equivalent to two r_0 in parallel, the impedance value is $r_0/2$. When the buffer strength is 2, only the p0, p1, and p2 is on, the output impedance is equivalent to three r_0 in parallel, the impedance value is $r_0/3$. When buffer strength is 3, the p0, p1, p2, and p3 is on, the output impedance is equivalent to four r_0 in parallel, the impedance value is $r_0/4$.

When output low level, the p0, p1, p2, p3 of PMOS is off, the n0, n1, n2, n3 of NMOS is on. When the buffer strength is set to 0 (buffer strength is weakest), only the n0 is on, the output impedance is maximum, the

impedance value is r_0 . When the buffer strength is set to 1, only the n_0 and n_1 is on, the output impedance is equivalent to two r_0 in parallel, the impedance value is $r_0/2$. When the buffer strength is 2, only the n_0 , n_1 , and n_2 is on, the output impedance is equivalent to three r_0 in parallel, the impedance value is $r_0/3$. When the buffer strength is 3, the n_0 , n_1 , n_2 , and n_3 is on, the output impedance is equivalent to four r_0 in parallel, the impedance value is $r_0/4$.

When GPIO is set to input or interrupt function, between the output driver circuit and the port is unconnected, the driver configuration is invalid.

NOTE

The typical value of r_0 is 180Ω .

9.7.3.6 Interrupt

Each group IO has an independent interrupt number. The IO within-group uses one interrupt number when one IO generates interrupt, the GPIO pins sent interrupt request to the interrupt controller. External Interrupt Status Register is used to query which IO generates interrupt.

The interrupt trigger of GPIO supports the following trigger types.

- Positive Edge: When a low level changes to a high level, the interrupt will generate. No matter how long a high level keeps, the interrupt generates only once.
- Negative Edge: When a high level changes to a low level, the interrupt will generate. No matter how long a low level keeps, the interrupt generates only once.
- High Level: Just keep a high level and the interrupt will always generate.
- Low Level: Just keep a low level and the interrupt will always generate.
- Double Edge: Positive and negative edge.

External Interrupt Configure Register is used to configure the trigger type.

The GPIO interrupt supports hardware debounce function by setting External Interrupt Debounce Register. Sample trigger signal using a lower sample clock, to reach the debounce effect because the dither frequency of the signal is higher than the sample frequency.

Set the sample clock source by `PIO_INT_CLK_SELECT` and the prescale factor by `DEB_CLK_PRE_SCALE`.

9.7.4 Register List

| Module Name | Base Address |
|-------------|--------------|
| GPIO | 0x02000000 |

| Register Name | Offset | Description |
|---------------|--------|-----------------------------|

9.8 GPADC

9.8.1 Overview

The General Purpose ADC (GPADC) can convert the external signal into a certain proportion of digital value, to realize the measurement of analog signal, which can be applied to power detection and key detection. This ADC is a type of successive approximation register (SAR) A/D converter.

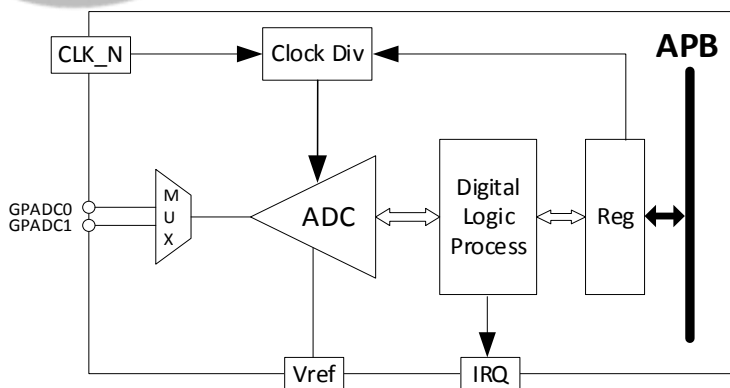

The GPADC has the following features:

- One independent channel
- 12-bit sampling resolution and 8-bit precision
- 64 FIFO depth of data register
- Power reference voltage: AVCC, and analog input voltage range: 0 to AVCC
- Maximum sampling frequency: 1 MHz
- Supports data compare and interrupt
- Supports three operation modes
 - Single conversion mode
 - Continuous conversion mode
 - Burst conversion mode

9.8.2 Block Diagram

Figure 9-70 shows the block diagram of the GPADC.

Figure 9-70 GPADC Block Diagram

9.8.3 Functional Description

9.8.3.1 External Signals

The following table describes the external signals of the GPADC.

Table 9-28 GPADC External Signals

| Signal | Description | Type |
|--------|--------------------|------|
| GPADC0 | ADC Input Channel0 | AI |
| GPADC1 | ADC Input Channel1 | AI |

9.8.3.2 Clock Sources

The GPADC has one clock source. The following table describes the clock source for GPADC. Users can see section 3.2 “[CCU](#)” for clock setting, configuration, and gating information.

Table 9-29 GPADC Clock Sources

| Clock Sources | Description |
|---------------|-------------|
| HOSC | 24 MHz |

9.8.3.3 GPADC Work Mode

- **Single conversion mode**

The GPADC completes one conversion in a specified channel, the converted data is updated at the data register of the corresponding channel.

- **Continuous conversion mode**

The GPADC has continuous conversion in a specified channel until the software stops, the converted data is updated at the data register of the corresponding channel.

- **Burst conversion mode**

The GPADC samples and converts in a specified channel, and sequentially stores the results in FIFO.

9.8.3.4 Clock and Timing Requirements

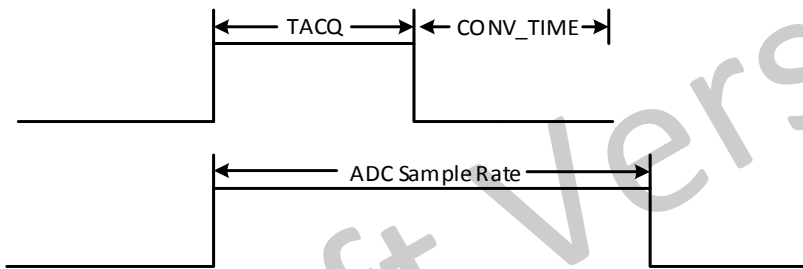

CLK_IN = 24 MHz

$CONV_TIME(\text{Conversion Time}) = 1/(24\text{MHz}/14\text{Cycles}) = 0.583 \text{ (us)}$

$TACQ > 10RC$ (R is output impedance of ADC sample circuit, C = 6.4 pF)

$ADC \text{ Sample Frequency} > TACQ + CONV_TIME$

Figure 9-71 GPADC Clock and Timing Requirement

9.8.3.5 GPADC Calculate Formula

GPADC calculate formula: $GPADC_DATA = V_{in}/V_{REF} * 4096$

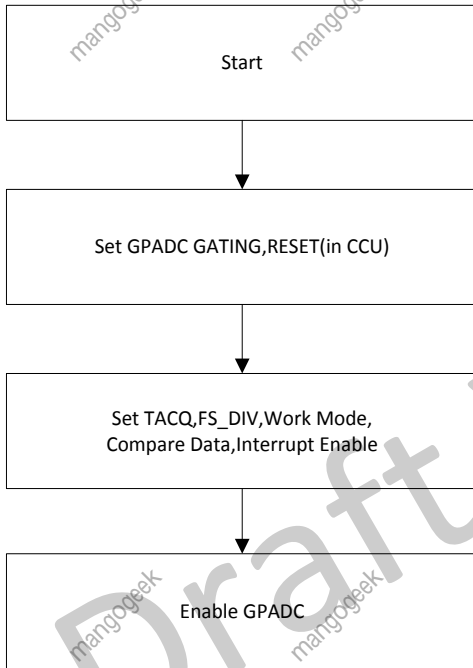

Where:

$V_{REF} = 1.8 \text{ V}$

9.8.4 Programming Guidelines

The GPADC initial process is as follows.

Figure 9-72 GPADC Initial Process

(1).Query Mode

- Step 1** Write 0x1 to the bit[16] of [GPADC BGR REG](#) to dessert reset.
- Step 2** Write 0x1 to the bit[0] of [GPADC BGR REG](#) to enable the GPADC clock.
- Step 3** Write 0x2F to the bit[15:0] of [GP_SR_CON](#) to set the acquiring time of ADC.
- Step 4** Write 0x1DF to the bit[31:16] of [GP_SR_CON](#) to set the ADC sample frequency divider.
- Step 5** Write 0x2 to the bit[19:18] of [GP_CTRL](#) to set the continuous conversion mode.
- Step 6** Write 0x1 to the bit[0] of [GP_CS_EN](#) to enable the analog input channel.
- Step 7** Write 0x1 to the bit[16] of [GP_CTRL](#) to enable the ADC function.
- Step 8** Read the bit[0] of [GP_DATA_INTS](#), if the bit is 1, then data conversion is complete.
- Step 9** Read the bit[11:0] of [GP_CHO_DATA](#), and calculate voltage value based on GPADC formula.

(2).Interrupt Mode

- Step 1** Write 0x1 to the bit[16] of [GPADC BGR REG](#) to dessert reset.
- Step 2** Write 0x1 to the bit[0] of [GPADC BGR REG](#) to enable the GPADC clock.
- Step 3** Write 0x2F to the bit[15:0] of [GP_SR_CON](#) to set the acquiring time of ADC.
- Step 4** Write 0x1DF to the bit[31:16] of [GP_SR_CON](#) to set the ADC sample frequency divider.
- Step 5** Write 0x2 to the bit[19:18] of [GP_CTRL](#) to set the continuous conversion mode.

- Step 6** Write 0x1 to the bit[0] of **GP_CS_EN** to enable the *analog input channel*.
- Step 7** Write 0x1 to the bit[0] of **GP_DATA_INTC** to enable the GPADC data interrupt.
- Step 8** Set interrupt number based on PLIC.
- Step 9** Put interrupt handler address into interrupt vector table based on the IRQ 148.
- Step 10** Write 0x1 to the bit16 of **GP_CTRL** to enable the ADC function.
- Step 11** Read the bit[11:0] of **GP_CHO_DATA** from the interrupt handler, calculate voltage value based on GPADC formula.

9.8.5 Register List

| Module Name | Base Address |
|-------------|--------------|
| GPADC | 0x02009000 |

| Register Name | Offset | Description |
|-----------------|--------|--|
| GP_SR_CON | 0x0000 | GPADC Sample Rate Configure Register |
| GP_CTRL | 0x0004 | GPADC Control Register |
| GP_CS_EN | 0x0008 | GPADC Compare and Select Enable Register |
| GP_FIFO_INTC | 0x000C | GPADC FIFO Interrupt Control Register |
| GP_FIFO_INTS | 0x0010 | GPADC FIFO Interrupt Status Register |
| GP_FIFO_DATA | 0x0014 | GPADC FIFO Data Register |
| GP_CDATA | 0x0018 | GPADC Calibration Data Register |
| GP_DATAH_INTC | 0x0020 | GPADC Data Low Interrupt Configure Register |
| GP_DATAH_INTC | 0x0024 | GPADC Data High Interrupt Configure Register |
| GP_DATA_INTC | 0x0028 | GPADC Data Interrupt Configure Register |
| GP_DATAH_INTS | 0x0030 | GPADC Data Low Interrupt Status Register |
| GP_DATAH_INTS | 0x0034 | GPADC Data High Interrupt Status Register |
| GP_DATA_INTS | 0x0038 | GPADC Data Interrupt Status Register |
| GP_CH0_CMP_DATA | 0x0040 | GPADC CH0 Compare Data Register |
| GP_CH1_CMP_DATA | 0x0044 | GPADC CH1 Compare Data Register |
| GP_CH0_DATA | 0x0080 | GPADC CH0 Data Register |
| GP_CH1_DATA | 0x0084 | GPADC CH1 Data Register |

9.8.6 Register Description

9.8.6.1 0x0000 GPADC Sample Rate Configure Register (Default Value: 0x01DF_002F)

| Offset: 0x0000 | | | Register Name: GP_SR_CON |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |

9.9 TPADC

9.9.1 Overview

The Touch Panel ADC (TPADC) is a 4-wire resistive touch screen controller, including a 12-bit SAR type A/D converter.

The TPADC has the following features:

- 12 bit SAR type A/D converter
- Configurable sample frequency up to 750 kHz
- One 32x12 FIFO for storing A/D conversion result
- Supports DMA slave interface
- Supports 4-wire resistive touch panel input detection
 - Supports pen down detection with programmable sensitivity
 - Supports single touch coordinate measurement
 - Supports dual touch detection
 - Supports touch pressure measurement with programmable threshold
 - Supports median and averaging filter for noise reduction
 - Supports X and Y coordinate exchange function
- Supports Aux ADC with up to 4 channels

9.9.2 Functional Description

9.9.2.1 External Signals

The following table describes the external signals of the TPADC.

Table 9-30 TPADC External Signals

| Signal | Description | Type |
|--------|----------------------|------|
| TP-X1 | Touch Panel X1 Input | AI |
| TP-X2 | Touch Panel X2 Input | AI |
| TP-Y1 | Touch Panel Y1 Input | AI |
| TP-Y2 | Touch Panel Y2 Input | AI |

9.9.2.2 Single-ended Mode and Differential Mode

The controller is a typical type of successive approximation ADC (SAR ADC) which contains a sample/hold, analog-to-digital conversion, serial data output functions.

The analog inputs (X+, X-, Y+, Y-) enter the ADC through the control register, the ADC can work in single-ended or differential mode. Selecting Aux ADC should work in single-ended mode; for a touch screen application, it works in a differential mode, which can effectively eliminate the impact on conversion accuracy caused by the parasitic resistance of the driver switch and external interference.

Figure 9-73 shows TPADC Single-Ended Mode for the measurement of Aux, using the 1.8 V reference source as the ADC reference voltage.

Figure 9-73 TPADC Single-Ended Mode for AUX ADC

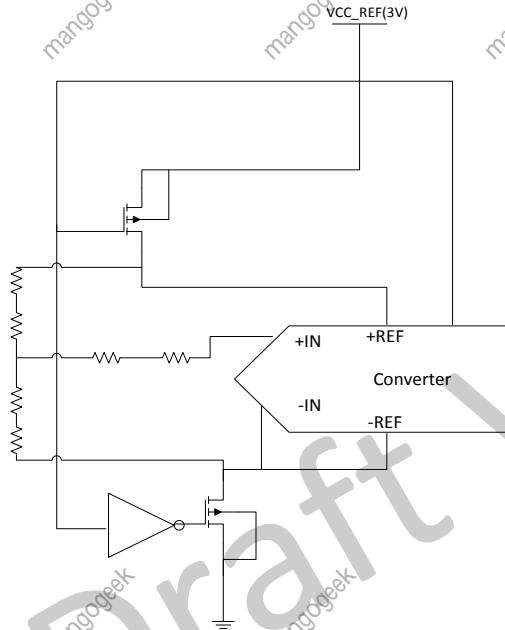

Figure 9-74 shows TPADC differential mode for the measurement of X/Y/Z coordinate of Touch Panel. The advantage of differential mode: +REF and -REF can directly input to the Y+ and Y-(or X+ and X-), which can eliminate the measurement error of X+/X-(or Y+/Y-) because of the switch on resistance. The disadvantage is that: both the sample or conversion process, the driver will need to be enabled. Compared with single-ended mode, the power consumption increases.

Figure 9-74 TPADC Differential Mode for Touch Panel

9.9.2.3 Single Touch Measurement

The following figure shows the operation principle of the single touch X-Coordinate measurement.

Figure 9-75 Single Touch X-Coordinate Measurement for Touch Panel

For an X coordinate measurement, the X+ pin is internally switched to VCC_REF and X- to GND. The X plate becomes a potential divider, and the voltage at the point of contact is proportional to its X co-ordinate. This voltage is measured on the Y+, which carries no current (hence there is no voltage drop in RY+ or RY-). Due to the ratio metric measurement method, the supply voltage does not affect measurement accuracy. The voltage

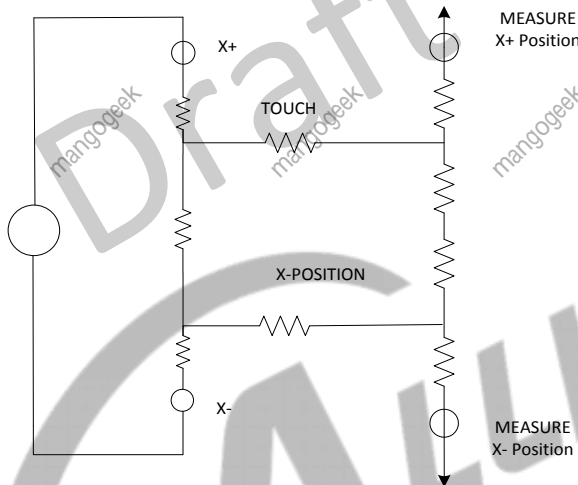

references VREF+ and VREF- are taken from after the matrix switches, so that any voltage drop in these switches has no effect on the ADC measurement.

Y coordinate measurements are similar to X coordinate measurements, with the X and Y plates interchanged.

9.9.2.4 Dual Touch Measurement

In single touch mode, it only needs to test X+ and Y+ signals. But in dual touch mode, it needs to test X+, X-, Y+, and Y- signals. The following figure shows the operation principle of dual touch detection for touch panel.

Figure 9-76 Dual Touch Detection for Touch Panel

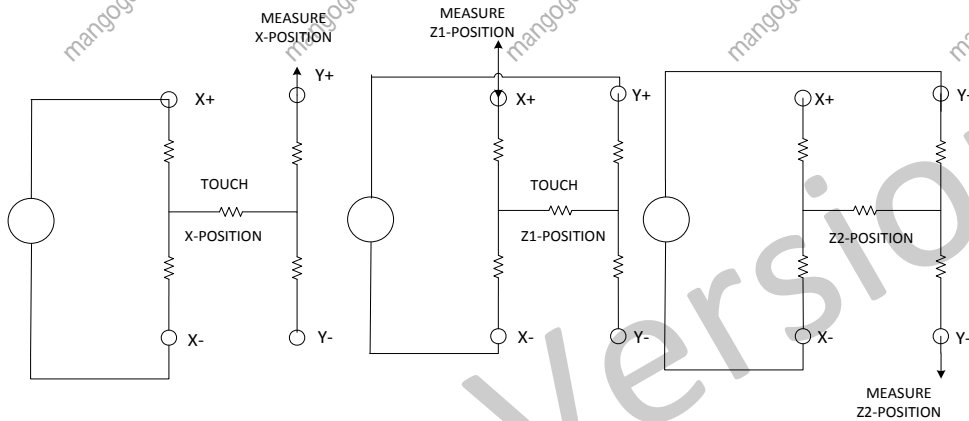

For X coordinates measurement, the X+ pin is internally switched to 3 V and X- to GND. The controller needs to test Y+ and Y-, Y coordinates measurement is similar. And record $\Delta X = |X+ - X-|$, $\Delta Y = |Y+ - Y-|$. In practice, we can set a threshold. If ΔX or ΔY greater than the threshold, we consider it as a dual touch, otherwise as a single touch.

9.9.2.5 Touch Pressure Measurement

The pressure applied to the touch screen by a pen or finger to filter unavailable can also be measured by the controller using some simple calculations. The contact resistance between the X and Y plates is measured, which provides a good indication of the size of the depressed area and the applied pressure. And the value of this resistance (R_{touch}) can be calculated using two different methods.

Figure 9-77 Touch Pressure Measurement for Touch Panel

(1) First Method

The first method requires the user to know the total resistance of the X plate tablet (R_{XPLATE}). Three touch screen conversions are required: measurement of the X position, $X_{POSITION}$ ($Y+$ input); measurement of the $X+$ input with the excitation voltage applied to $Y+$ and $X-$ ($Z1$ measurement); and measurement of the $Y-$ input with the excitation voltage applied to $Y+$ and $X-$ ($Z2$ measurement). These three measurements are illustrated in following Figure. The controller have two special ADC channel settings to configure the X and Y switches for the $Z1$ and $Z2$ measurements and store the results in the $Z1$ and $Z2$ result registers. The touch resistance (R_{TOUCH}) can then be calculated using the following equation.

$$R_{TOUCH} = (R_{XPLATE}) \times (X_{POSITION}/4096) \times [(Z2/Z1) - 1]$$

(2) Second Method

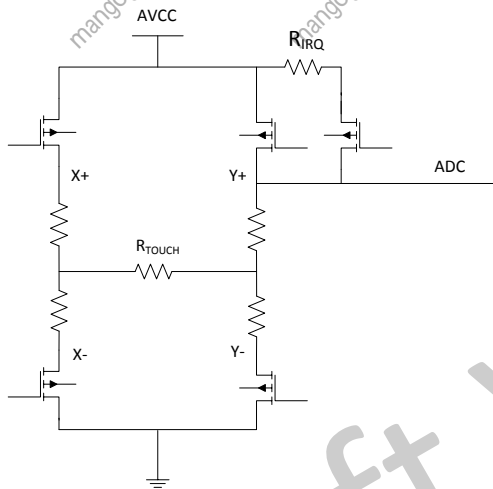

The second method requires the user to know the resistance of the X-plate and Y-plate tablets. Three touch screen conversions are required: a measurement of the X position ($X_{POSITION}$), the Y position ($Y_{POSITION}$), and the $Z1$ position. The following equation also calculates the touch resistance (R_{TOUCH}).

$$R_{TOUCH} = R_{XPLATE} \times (X_{POSITION}/4096) \times [(4096/Z1) - 1] - R_{YPLATE} \times [1 - (Y_{POSITION}/4096)]$$

9.9.2.6 Pen Down Detection

Pen down detection is used as an interrupt to the host. $RIRQ$ is an internal pull-up resistor with a programmable value from 6 k Ω to 96 k Ω (default 48 k Ω).

Figure 9-78 Pen Down Detection for Touch Panel

The pen down IRQ output is pulled high by an internal pull-up. In the pen down detection, the Y- driver is enabled and connected to GND, and the pen down IRQ output is connected to the X+ input. When the panel is touched, the X+ input is pulled to ground through the touch screen, and the pen down IRQ output goes low because of the current path through the panel to GND, initiating an interrupt to the processor.

During the measurement cycle for X-, Y-, and Z-position, the X+ input is disconnected from the pen down IRQ pull-down transistor to eliminate any pull-up resistor leakage current from flowing through the touch screen, thus causing no errors.

9.9.2.7 Median and Averaging Filter

Touch screens are composed of two resistive layers, normally placed over an LCD screen. Because these layers are in close proximity to the LCD screen, noise can be coupled from the screen onto these resistive layers, causing errors in the touch screen positional measurements.

The controller contains a filtering block to process the data and discard the spurious noise before sending the information to the host. The purpose of this block is not only the suppression of noise; the on-chip filtering also greatly reduces the host processing loading.

The processing function consists of two filters that are applied to the converted results: the median filter and the averaging filter. The median filter suppresses the isolated out-of-range noise and sets the number of measurements to be taken. These measurements are arranged in a temporary array, where the first value is the smallest measurement and the last value is the largest measurement. Then the averaging filter size determines the number of values to average. There are four choices which is configured by TP_CTRL3 register (bit 1 and bit 0) to filtrate the ADC sampling data.

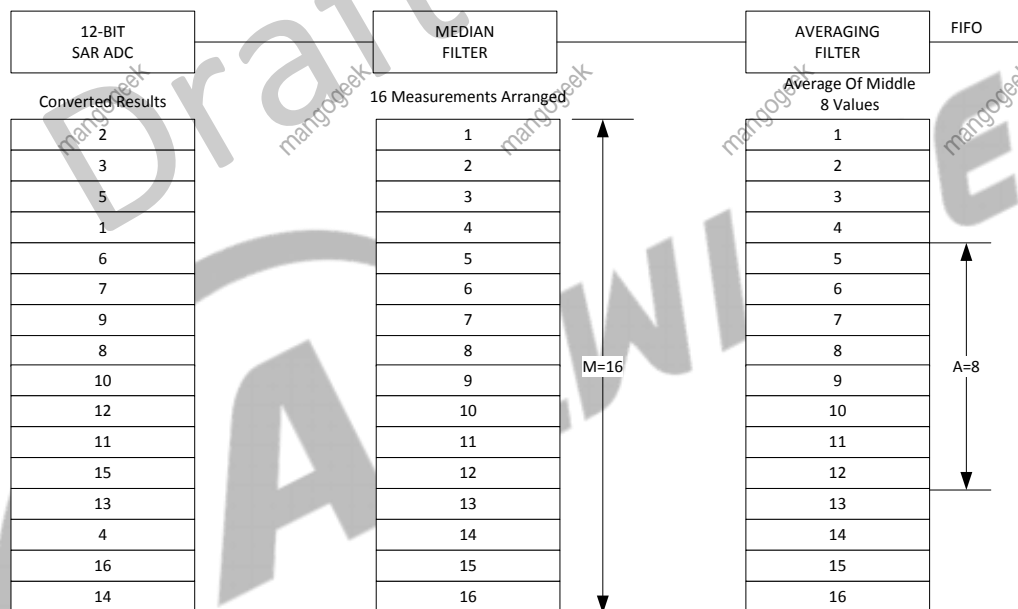

Figure 9-79 Median and Averaging Filter Size

| Bit1 | Bit0 | Averaging Filter Size | Median Filter Size |
|------|------|-----------------------|--------------------|
| 0 | 0 | 2 | 4 |

| Bit1 | Bit0 | Averaging Filter Size | Median Filter Size |
|------|------|-----------------------|--------------------|
| 0 | 1 | 3 | 5 |
| 1 | 0 | 4 | 8 |
| 1 | 1 | 8 | 16 |

Example: In this example, the bit[1:0] of TP_CTRL_REG3 is configured as 2'b11. So the median filter has a window size of 16. This means that 16 measurements are taken and arranged in descending order in a temporary array. The averaging window size in this example is 8. The output is the average of the middle eight values of the 16 measurements taken with the median filter.

Figure 9-80 Median and Averaging Filter Example

9.9.3 Register List

| Module Name | Base Address |
|-------------|--------------|
| TPADC | 0x02009C00 |

| Register Name | Offset | Description |
|----------------------|--------|------------------------------------|

9.9.4.7 0x001C TP Calibration Data Register (Default Value:0x0000_0800)

| Offset: 0x001C | | | Register Name: TP_CALI_DATA_REG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:12 | / | / | / |
| 11:0 | R/W | 0x800 | TP_CDAT TP Common Data It is used to adjust the tolerance of the internal ADC. |

9.9.4.8 0x0024 TP Data Register (Default Value:0x0000_0000)

In touch panel mode, the data stored in this register bases on TP_FIFO_MODE_SELECT. In Auxiliary ADC mode, the data stored in this register bases on ADC_CHAN_SELECT. If four channels are enabled, FIFO will access the input data in successive turn (ADC_CHAN0 -> ADC_CHAN1 -> ADC_CHAN2 -> ADC_CHAN3). If only two or three channels are selected, such as ADC_CHAN0 and ADC_CHAN3, firstly ADC_CHAN0 input data is accessed, then ADC_CHAN3 input data.

| Offset: 0x0024 | | | Register Name: TP_DATA_REG |

9.10 LRADC

9.10.1 Overview

The low rate analog-to-digital converter (LRADC) can convert the external signal into a certain proportion of digital value, to realize the measurement of analog signal, which can be applied to power detection and key detection.

The LRADC has the following features:

- 6-bit sampling resolution and 5-bit precision
- Sample rate up to 2 kHz
- Supports hold Key and general Key
- Supports normal, continuous and single working mode
- Power supply voltage: AVCC, and power reference voltage: $0.75 \cdot AVCC$, analog input and detected voltage range: 0 to 1.266 V
- Supports interrupt

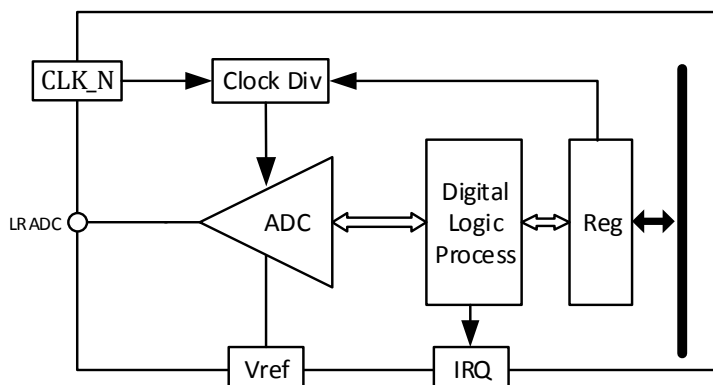

NOTE

The LRADC has a 6-bit resolution, 1-bit offset error, and 1-bit precision error. After the LRADC calibrates 1-bit offset error, the LRADC has 5-bit precision.

9.10.2 Block Diagram

Figure 9-81 shows the block diagram of the LRADC.

Figure 9-81 LRADC Block Diagram

9.10.3 Functional Description

9.10.3.1 External Signals

The following table describes the external signals of the LRADC. The LRADC pin is the analog input signal.

Table 9-31 LRADC External Signals

| Signal | Description | Type |
|--------|-----------------------|------|
| LRADC | Analog Input Channel0 | AI |

9.10.3.2 Clock Sources

The LRADC has one clock source. The following table describes the clock source for LRADC.

Table 9-32 LRADC Clock Sources

| Clock Sources | Description |
|---------------|-----------------|
| LOSC | 32.768 kHz LOSC |

9.10.3.3 LRADC Working Mode

- **Normal Mode**

The LRADC gathers 8 samples, the average value of these 8 samples is updated in the data register, and the data interrupt sign is enabled. It is sampled repeatedly according to this mode until the LRADC is disabled.

- **Continuous Mode**

The LRADC gathers 8 samples every other $8*(N+1)$ sample cycle. The average value of every 8 samples is updated in the data register, and the data interrupt sign is enabled. (N is defined in the bit[19:16] of [LRADC_CTRL](#)).

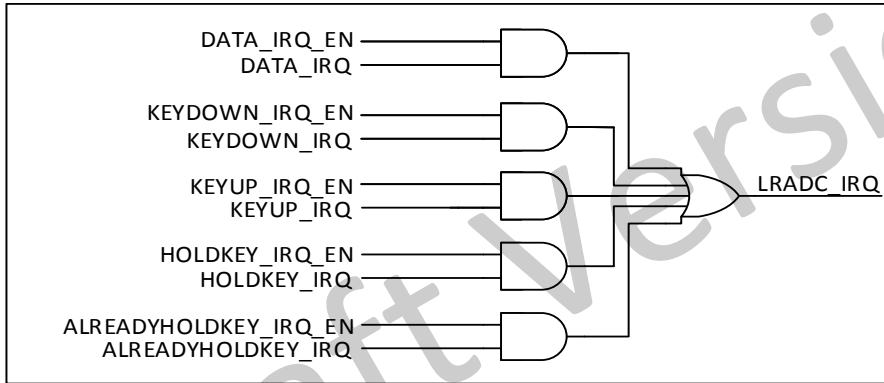

- **Single Mode**

The LRADC gathers 8 samples, and the average value of these 8 samples is updated in the data register, and the data interrupt sign is enabled at the same time, then the LRADC stops sample.

9.10.3.4 Interrupt

Each LRADC channel has five interrupt sources and five interrupt enable controls.

Figure 9-82 LRADC Interrupt

When the input voltage is between LEVEL A (1.35V) and LEVEL B (control by the bit[5:4] of [LRADC_CTRL](#)), the IRQ1 can be generated. When the input voltage is lower than LEVEL B, the IRQ2 can be generated.

If the controller receives IRQ1 and does not receive IRQ2 at the same time, then the controller will generate [Hold Key Pending](#), otherwise [Data IRQ Pending](#).

The Hold KEY usually is used for the self-locking key. When the self-locking key holds a locking status, the controller receives the IRQ2, then the controller will generate [Already Hold Pending](#).

9.10.3.5 Calculation Formula

Calculation formula: $LRADC_DATA = V_{in}/V_{REF} * 63$, $V_{REF}=1.35\text{ V}$

9.10.4 Programming Guidelines

9.10.4.1 Normal Detecting

Perform the following steps for normal detecting mode:

- Step 1** Configure [LRADC_BGR_REG](#)[LRADC_GATING] to 0 to disable the clock of LRADC.
- Step 2** Configure [LRADC_BGR_REG](#)[LRADC_RST] to 1 to deassert the reset of LRADC.
- Step 3** Configure [LRADC_BGR_REG](#)[LRADC_GATING] to 1 to enable the clock of LRADC.
- Step 4** Configure [LRADC_CTRL](#)[LRADC_SAMPLE_RATE] to set the appropriate sampling frequency.
- Step 5** Configure [LRADC_CTRL](#)[LEVELB_VOL] to set the appropriate voltage threshold.

- Step 6** Configure [LRADC_CTRL](#)[FIRST_CONVER_DLY] and [LRADC_CTRL](#)[LEVELA_B_CNT] to set the appropriate debounce value.
- Step 7** Configure [LRADC_CTRL](#)[LRADC_HOLD_KEY_EN] to 1.
- Step 8** Configure [LRADC_CTRL](#)[KEY_MODE_SELECT] to 0 to set the normal mode.
- Step 9** Configure [LRADC_INTC](#) to enable the corresponding interrupt.
- Step 10** Configure [LRADC_CTRL](#)[LRADC_HOLD_KEY_EN] to 1.
- Step 11** Read the corresponding key voltage value from [LRADC_DATA](#) when the CPU receives the LRADC interrupt.

9.10.4.2 Single Detecting

Perform the following steps for the single detecting mode:

- Step 1** Configure [LRADC_BGR_REG](#)[LRADC_GATING] to 0 to disable the clock of LRADC.
- Step 2** Configure [LRADC_BGR_REG](#)[LRADC_RST] to 1 to deassert the reset of LRADC.
- Step 3** Configure [LRADC_BGR_REG](#)[LRADC_GATING] to 1 to enable the clock of LRADC.
- Step 4** Configure [LRADC_CTRL](#)[LRADC_SAMPLE_RATE] to set the appropriate sampling frequency.
- Step 5** Configure [LRADC_CTRL](#)[LEVELB_VOL] to set the appropriate voltage threshold.
- Step 6** Configure [LRADC_CTRL](#)[FIRST_CONVER_DLY] and [LRADC_CTRL](#)[LEVELA_B_CNT] to set the appropriate debounce value.
- Step 7** Configure [LRADC_CTRL](#)[LRADC_HOLD_KEY_EN] to 1.
- Step 8** Configure [LRADC_CTRL](#)[KEY_MODE_SELECT] to 1 to set the single mode.
- Step 9** Configure [LRADC_INTC](#) to enable the corresponding interrupt.
- Step 10** Configure [LRADC_CTRL](#)[LRADC_HOLD_KEY_EN] to 1.
- Step 11** Read the corresponding key voltage value from [LRADC_DATA](#) when the CPU receives the LRADC interrupt.

9.10.4.3 Continuous Detecting

Perform the following steps for continuous detecting mode:

- Step 1** Configure [LRADC_BGR_REG](#)[LRADC_GATING] to 0 to disable the clock of LRADC.
- Step 2** Configure [LRADC_BGR_REG](#)[LRADC_RST] to 1 to deassert the reset of LRADC.

- Step 3** Configure [LRADC_BGR_REG](#)[LRADC_GATING] to 1 to enable the clock of LRADC.
- Step 4** Configure [LRADC_CTRL](#)[LRADC_SAMPLE_RATE] to set the appropriate sampling frequency.
- Step 5** Configure [LRADC_CTRL](#)[LEVELB_VOL] to set the appropriate voltage threshold.
- Step 6** Configure [LRADC_CTRL](#)[FIRST_CONVERT_DLY] and [LRADC_CTRL](#)[LEVELA_B_CNT] to set the appropriate debounce value.
- Step 7** Configure [LRADC_CTRL](#)[LRADC_HOLD_KEY_EN] to 1.
- Step 8** Configure [LRADC_CTRL](#)[KEY_MODE_SELECT] to 2 to set the continuous mode, and configure [LRADC_CTRL](#)[CONTINUE_TIME_SELECT] to set a sampling interval.
- Step 9** Configure [LRADC_INTC](#) to enable the corresponding interrupt.
- Step 10** Configure [LRADC_CTRL](#)[LRADC_HOLD_KEY_EN] to 1.
- Step 11** Read the corresponding key voltage value from [LRADC_DATA](#) when the CPU receives the LRADC interrupt.

9.10.5 Register List

| Module Name | Base Address |

9.11 PWM

9.11.1 Overview

The Pulse Width Modulation (PWM) module can output the configurable PWM waveforms and measure the external input waveforms.

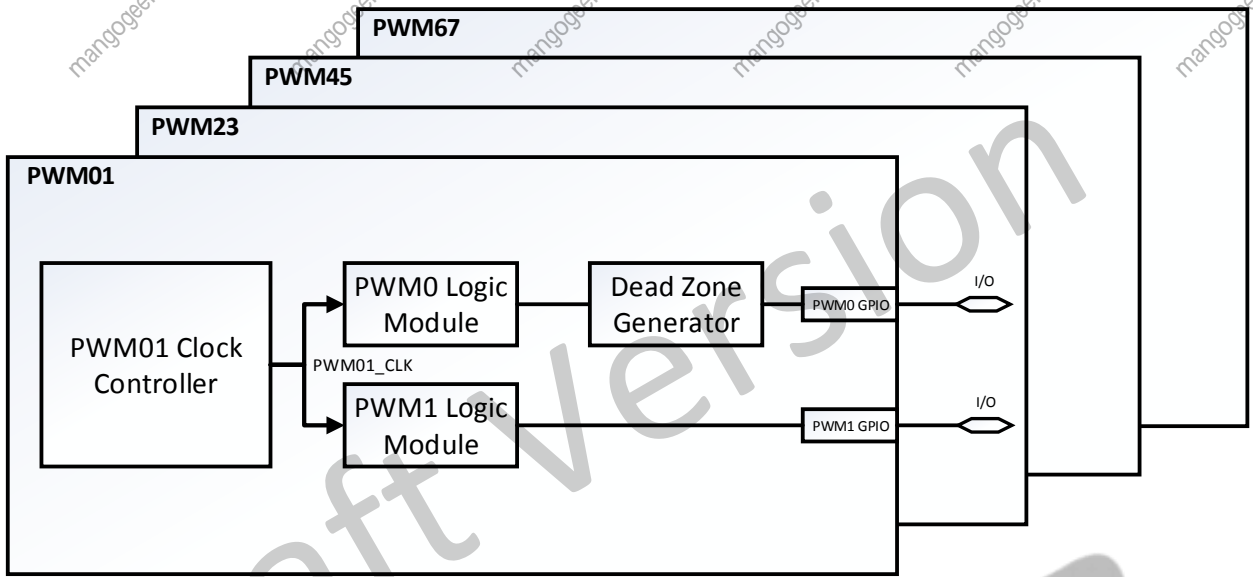

The PWM has the following features:

- Supports 8 independent PWM channels (PWM0 to PWM7)
 - Supports PWM continuous mode output
 - Supports PWM pulse mode output, and the pulse number is configurable
 - Output frequency range: 0 to 24 MHz or 100 MHz
 - Various duty-cycle: 0% to 100%
 - Minimum resolution: 1/65536
- Supports 4 complementary pairs output
 - PWM01 pair (PWM0 + PWM1), PWM23 pair (PWM2 + PWM3), PWM45 pair (PWM4 + PWM5), PWM67 pair (PWM6 + PWM7)
 - Supports dead-zone generator, and the dead-zone time is configurable
- Supports 4 group of PWM channel output for controlling stepping motors
 - Supports any plural channels to form a group, and output the same duty-cycle pulse
 - In group mode, the relative phase of the output waveform for each channel is configurable
- Supports 8 channels capture input
 - Supports rising edge detection and falling edge detection for input waveform pulse
 - Supports pulse-width measurement for input waveform pulse

9.11.2 Block Diagram

The PWM includes multi PWM channels. Each channel can generate different PWM waveform by the independent counter and duty-ratio configuration register. Each PWM pair shares one group of clock and dead-zone generator to generate PWM waveform.

Figure 9-83 PWM Block Diagram

Each PWM pair consists of 1 clock module, 2 timer logic module, and 1 programmable dead-zone generator.

9.11.3 Functional Description

9.11.3.1 External Signals

The following table describes the external signals of the PWM.

Table 9-33 PWM External Signals

| Signal | Description | Type |
|--------|-----------------------------|------|
| PWM0 | Pulse Width Module Channel0 | I/O |
| PWM1 | Pulse Width Module Channel1 | I/O |
| PWM2 | Pulse Width Module Channel2 | I/O |
| PWM3 | Pulse Width Module Channel3 | I/O |
| PWM4 | Pulse Width Module Channel4 | I/O |
| PWM5 | Pulse Width Module Channel5 | I/O |
| PWM6 | Pulse Width Module Channel6 | I/O |
| PWM7 | Pulse Width Module Channel7 | I/O |

9.11.3.2 Typical Application

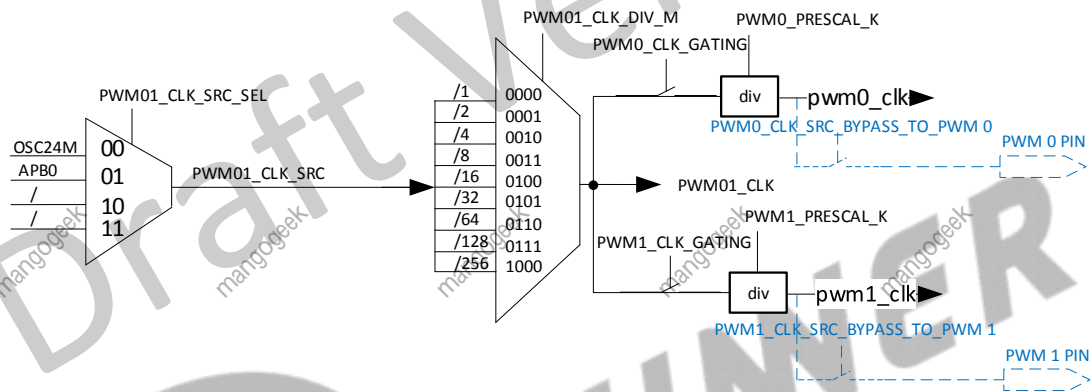

- Suitable for display device, such as LCD

- Suitable for electric motor control

9.11.3.3 Clock Controller

Using PWM01 as an example. The other PWM pairs are the same as PWM01.

Figure 9-84 PWM01 Clock Controller Diagram

The clock controller of each PWM pair includes clock source select ([PWM01_CLK_SRC](#)), 1~256 scaler ([PWM01_CLK_DIV_M](#)). Each PWM channel has the secondary frequency division ([PWM_PRESCAL_K](#)), clock source bypass ([PWMx_CLK_BYPASS](#)) and clock switch ([PWMx_CLK_GATING](#)).

The clock sources have HOSC and APB0. The HOSC comes from the external high-frequency oscillator; the APB0 is APB0 bus clock.

The bypass function of the clock source is that the clock source directly accesses PWM output, the PWM output waveform is the waveform of the clock controller output. The BYPASS gridlines in the above figure indicate the bypass function of the clock source, see Figure 9-85 for the details about implement. At last, the output clock of the clock controller is sent to the PWM logic module.

9.11.3.4 PWM Output

Taking PWM01 as an example, Figure 9-85 indicates the PWM01 output logic diagram. The logic diagrams of other PWM pairs are the same as PWM01.

The timer logic module of PWM consists of one 16-bit up-counter ([PCNTR](#)) and three 16-bit parameters ([PWM_ENTIRE_CYCLE](#), [PWM_ACT_CYCLE](#), [PWM_COUNTER_START](#)). The [PWM_ENTIRE_CYCLE](#) is used to

control the PWM cycle, the [PWM_ACT_CYCLE](#) is used to control the duty-cycle, the [PWM_COUNTER_START](#) is used to control the output phase (multi-channel synchronization work requirements).

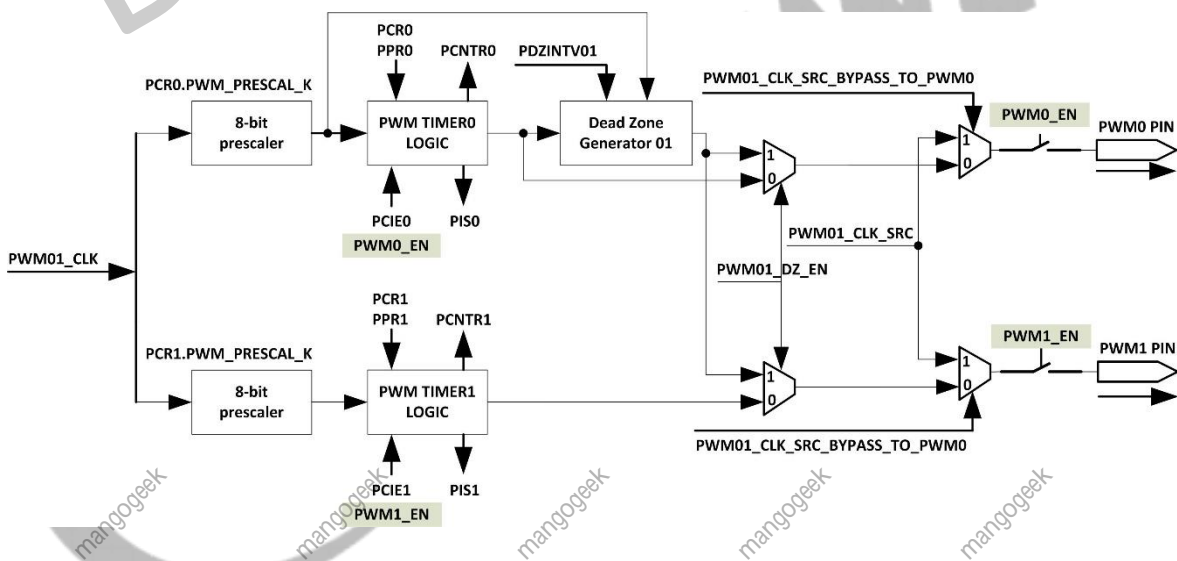

The [PWM_ENTIRE_CYCLE](#) and the [PWM_ACT_CYCLE](#) support the cache load, after PWM output is enabled, the register values of the [PWM_ENTIRE_CYCLE](#) and the [PWM_ACT_CYCLE](#) can be changed anytime, the changed value caches into the cache register. When the PCNTR counter outputs a period of PWM waveform, the value of the cache register can be updated for the PCNTR control. The purpose of the cache load is to avoid the unstable PWM output waveform with the burred feature when updating the values of the [PWM_ENTIRE_CYCLE](#) and [PWM_ACT_CYCLE](#).

The PWM supports cycle and pulse waveform output.

Cycle mode: The PWM outputs the setting PWM waveform continually, that is, the output waveform is a continuous PWM square wave.

Pulse mode: After setting the [PWM_PUL_NUM](#) parameter, the PWM outputs (PWM_PULNUM+1) periods of PWM waveform, that is, the waveform with several pulses are output.

Figure 9-85 PWM01 Output Logic Module Diagram

9.11.3.5 Up-Counter and Comparator

The period, duty-cycle, and phase of PWM output waveform are decided by the [PCNTR](#), [PWM_ENTIRE_CYCLE](#), [PWM_ACT_CYCLE](#), and [PWM_COUNTER_START](#). The rules are as follows.

- $PCNTR = (PCNTR == PWM_ENTIRE_CYCLE) ? 0 : PCNTR + 1$
- PCNTR starts to count by [PWM_COUNTER_START](#), the counter of a PWM period is (PWM_ENTIRE_CYCLE+1).
- $PCNTR > (PWM_ENTIRE_CYCLE - PWM_ACT_CYCLE)$, output “active state”

- $PCNTR \leq (PWM_ENTIRE_CYCLE - PWM_ACT_CYCLE)$, output “~ (active state)”

Active state of PWM0 channel is high level (PCR0. PWM_ACT_STA = 1)

When $PCNTR0 > (PPR0.PWM_ENTIRE_CYCLE - PPR0.PWM_ACT_CYCLE)$, then PWM0 outputs 1 (high level).

When $PCNTR0 \leq (PPR0.PWM_ENTIRE_CYCLE - PPR0.PWM_ACT_CYCLE)$, then PWM0 outputs 0 (low level).

The formula of the output period and the duty-cycle for PWM are as follows.

$$T_{period} = (PWM01_CLK / PWM0_PRESCALE_K)^{-1} * (PPR0.PWM_ENTIRE_CYCLE + 1)$$

$$T_{high-level} = (PWM01_CLK / PWM0_PRESCALE_K)^{-1} * PPR0.PWM_ACT_CYCLE$$

$$T_{low-level} = (PWM01_CLK / PWM0_PRESCALE_K)^{-1} * (PPR0.PWM_ENTIRE_CYCLE + 1 - PPR0.PWM_ACT_CYCLE)$$

$$Duty-cycle = (high\ level\ time) / (1\ period\ time) = T_{high-level} / T_{period}$$

Figure 9-86 PWM0 High Level Active State

Active state of PWM0 channel is low level (PCR0. PWM_ACT_STA = 0)

When $PCNTR0 > (PPR0.PWM_ENTIRE_CYCLE - PPR0.PWM_ACT_CYCLE)$, then PWM0 outputs 0.

When $PCNTR0 \leq (PPR0.PWM_ENTIRE_CYCLE - PPR0.PWM_ACT_CYCLE)$, then PWM0 outputs 1.

The formula of the output period and the duty-cycle for PWM are as follows.

$$T_{period} = (PWM01_CLK / PWM0_PRESCALE_K)^{-1} * (PPR0.PWM_ENTIRE_CYCLE + 1)$$

$$T_{high-level} = (PWM01_CLK / PWM0_PRESCALE_K)^{-1} * (PPR0.PWM_ENTIRE_CYCLE + 1 - PPR0.PWM_ACT_CYCLE)$$

$$T_{low-level} = (PWM01_CLK / PWM0_PRESCALE_K)^{-1} * PPR0.PWM_ACT_CYCLE$$

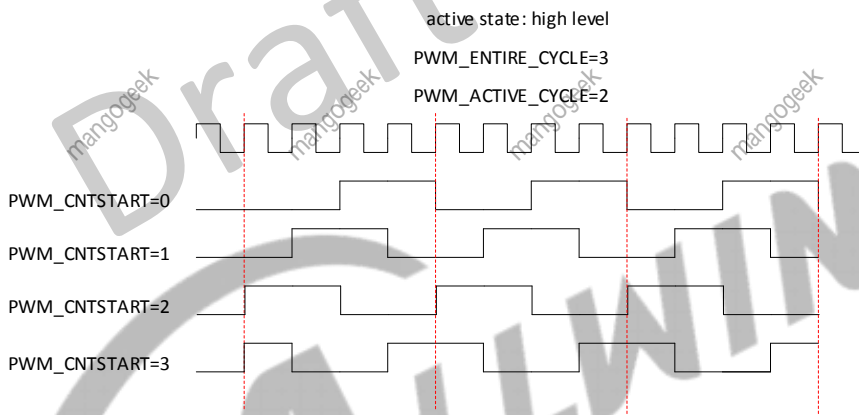

$$Duty-cycle = (low\ level\ time) / (1\ period\ time) = T_{low-level} / T_{period}$$

Figure 9-87 PWM0 Low Level Active State

The counter of PCNTR starts from 0 by default, it can output the pulse control of the waveform by setting [PWM_COUNTER_START](#). The figure is as follows.

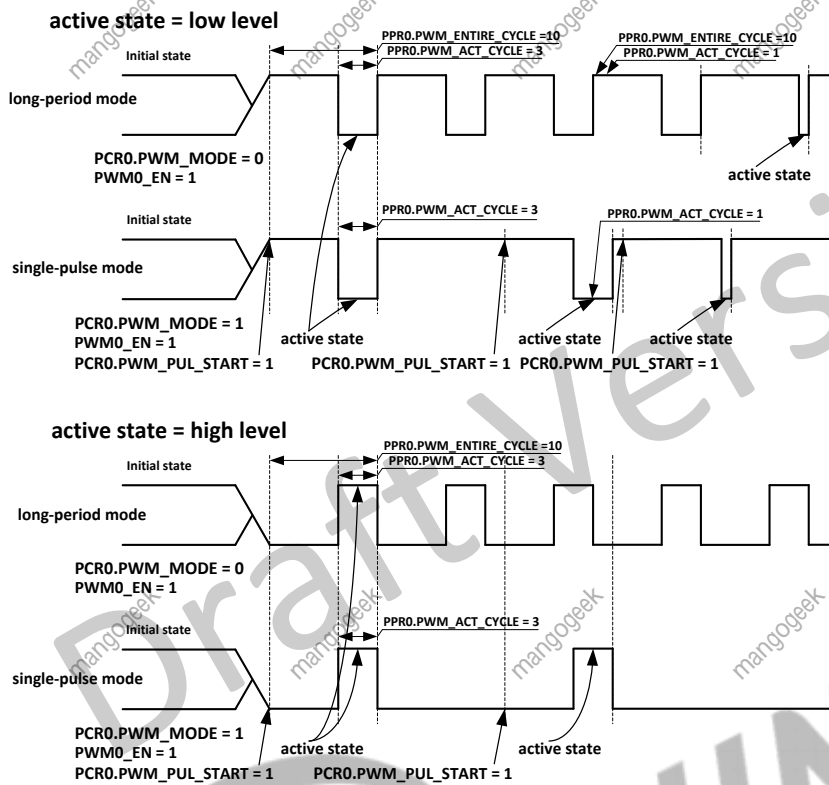

Figure 9-88 Phase of PWM0 High Level Active State

9.11.3.6 Pulse Mode and Cycle Mode

The PWM output supports pulse mode and cycle mode. PWM in pulse mode outputs one pulse waveform, but PWM in cycle mode outputs continuous waveform. Figure 9-89 shows the PWM output waveform in pulse mode and cycle mode.

Figure 9-89 PWM0 Output Waveform in Pulse Mode and Cycle Mode

Each channel of the PWM module supports the PWM output of pulse mode and cycle mode, the active state of the PWM output waveform can be programmed to control.

When $PCR0[PWM_MODE]$ is 0, the PWM0 outputs in cycle mode. When $PCR0[PWM_MODE]$ is 1, the PWM0 outputs in pulse mode.

Specifically, in pulse mode, after the PWM0 channel enabled, $PCR0[PWM_PUL_START]$ needs to be set to 1 when the PWM0 needs to output pulse waveform, after completed the output, $PCR0[PWM_PUL_START]$ can be cleared to 0 by hardware. The next setting 1 can be operated after $PCR0[PWM_PUL_START]$ is cleared.

9.11.3.7 Complementary Pair Output

Every PWM pair supports complementary pair output and PWM pair with dead-time. Figure 9-90 shows the complementary pair output of PWM01.

Figure 9-90 PWM01 Complementary Pair Output

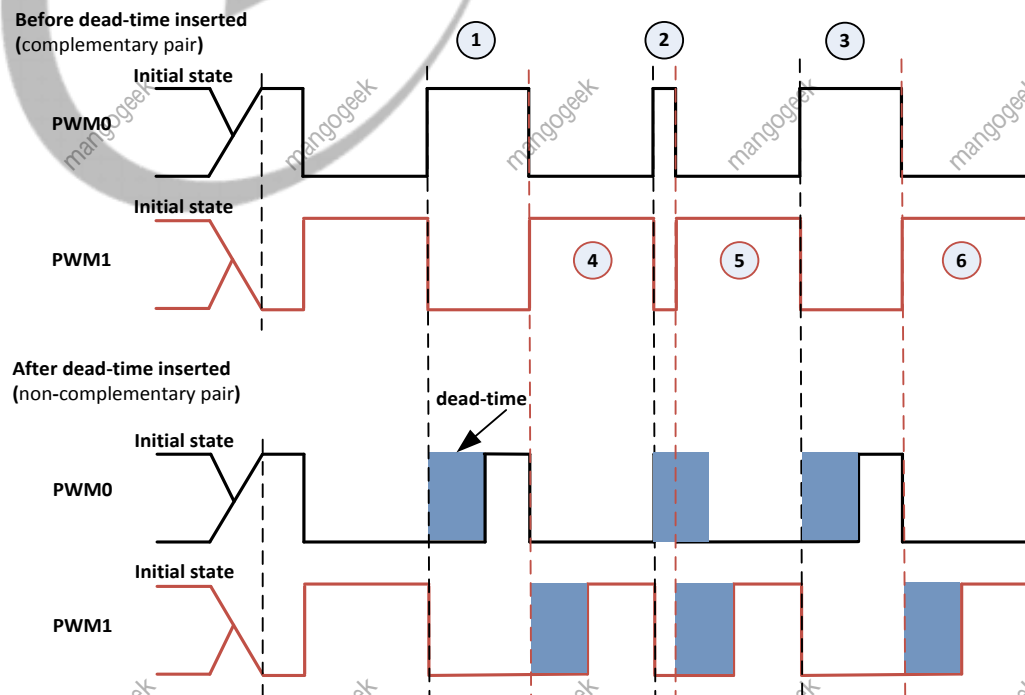

The complementary pair output needs to satisfy the following conditions:

- PWM0 and PWM1 have the same clock divider, frequency, duty-cycle, and phase
- PWM0 and PWM1 have an opposite active state
- Enable the clock gating of PWM0 and PWM1 at the same time
- Enable the waveform output of PWM0 and PWM1 at the same time

9.11.3.8 Dead-time Generator

Every PWM pair has a programmable dead-time generator. When the dead-time function of the PWM pair enabled, the PWM01 output waveform is decided by PWM timer logic and DeadZone Generator. Figure 9-91 shows the output waveform.

Figure 9-91 Dead-time Output Waveform

The PWM waveform before the insertion of dead-time indicates a complementary waveform pair of non-inserted dead-time in Dead Zone Generator 01.

The PWM waveform after the insertion of dead-time indicates a non-complementary PWM waveform pair inserted dead-time in a complementary waveform pair of Dead Zone Generator 01. The PWM waveform pair at last outputs to PWM0 pin and PWM1 pin.

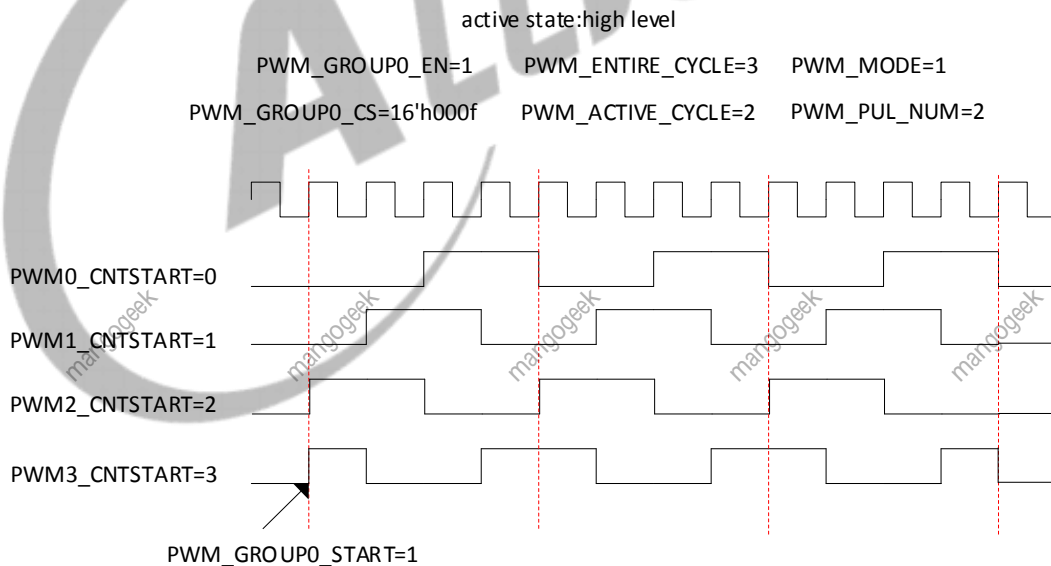

For the complementary pair of Dead Zone Generator 01, the principle of inserting dead-time is that to insert dead-time as soon as the rising edge came. If the high level time for mark ② in the above figure is less than dead-time, then dead-time will override the high level. The setting of dead-time needs to consider the period and the duty-cycle of the output waveform. The dead-time formula is defined as follows:

$$\text{Dead-time} = (\text{PWM01_CLK} / \text{PWM0_PRESCALE_K})^{-1} * \text{PDZINTV01}$$

9.11.3.9 PWM Group Mode

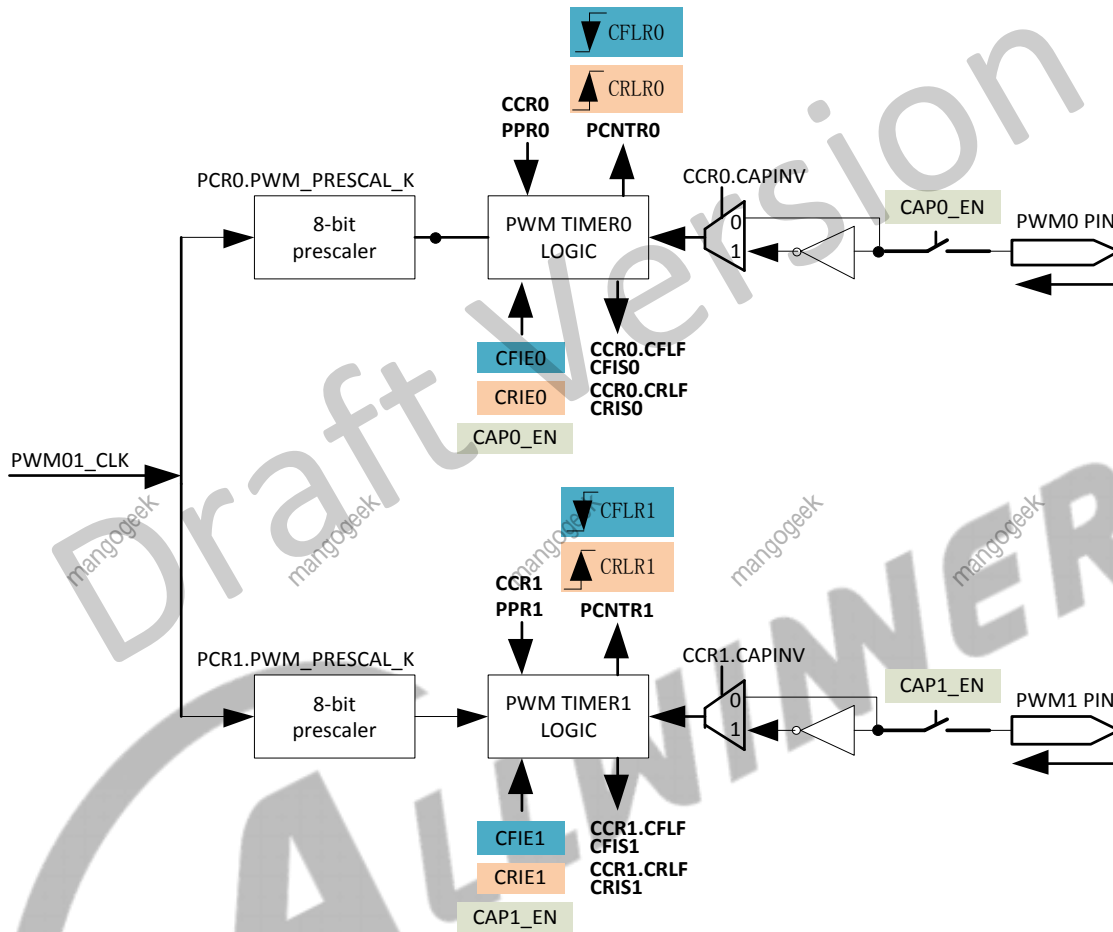

Taking PWM Group0 as an example. The same group of PWM channel is selected to work by PGR0.CS; the same [PWM_ENTIRE_CYCLE](#), [PWM_ACT_CYCLE](#) are set by the same clock configuration; the different [PWM_COUNTER_START](#) can output PWM group signals with the same duty-cycle and the different phase.

Figure 9-92 Group 0~3 PWM Signal Output

9.11.3.10 Capture Input

Figure 9-93 PWM01 Capture Logic Module Diagram

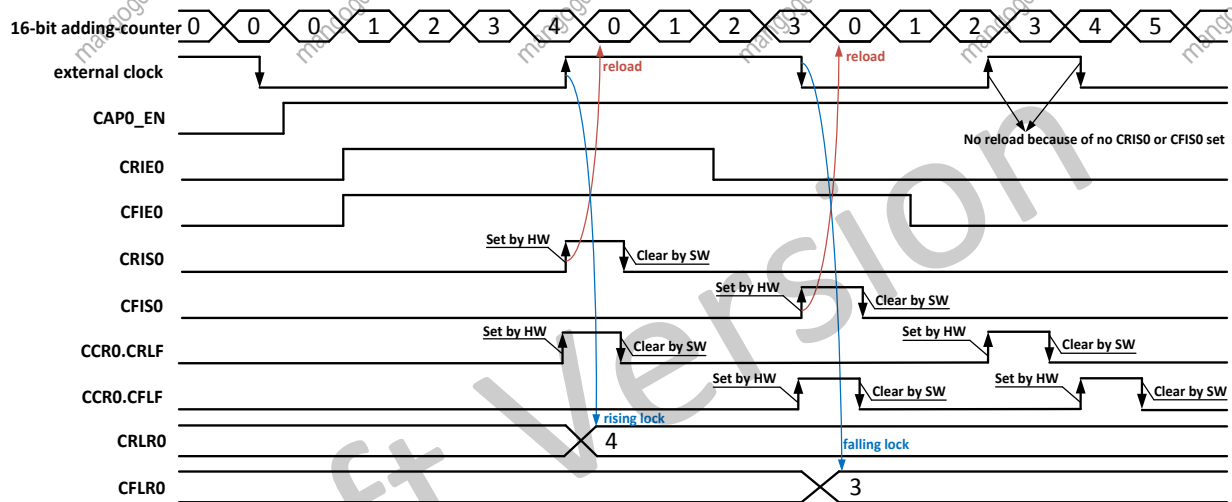

Besides the timer logic module of every PWM channel generates PWM output, it can be used to capture the rising edge and the falling edge of the external clock. Using the PWM0 channel as an example, the PWM0 channel has one **CFLR0** and one **CRLR0** for capturing up-counter value on the falling edge and rising edge, respectively. You can calculate the period of the external clock by **CFLR0** and **CRLR0**.

$$T_{\text{high-level}} = (\text{PWM01_CLK} / \text{PWM0_PRESCALE_K})^{-1} * \text{CRLR0}$$

$$T_{\text{low-level}} = (\text{PWM01_CLK} / \text{PWM0_PRESCALE_K})^{-1} * \text{CFLR0}$$

$$T_{\text{period}} = T_{\text{high-level}} + T_{\text{low-level}}$$

Figure 9-94 PWM0 Channel Capture Timing

When the capture input function of the PWM0 channel is enabled, the PCNTR of the PWM0 channel starts to work.

When the timer logic module of PWM0 captures a rising edge, the current value of the up-counter is locked to **CRLR0** and **CCR0[CRLF]** is set to 1. If **CRIE0** is 1, then **CRISO** is set to 1, the PWM0 channel sends interrupt requests, and the up-counter is loaded to 0 and continues to count. If **CRIE0** is 0, the timer logic module of PWM0 captures a rising edge, **CRISO** cannot be set to 1, the up-counter is not loaded to 0.

When the timer logic module of PWM0 captures one falling edge, the current value of PCNTR is locked to **CFLR0** and **CCR0[CFLF]** is set to 1. If **CFIE0** is 1, then **CFISO** is set to 1, the PWM0 channel sends interrupt requests, and the up-counter is loaded to 0 and continues to count. If **CFIE0** is 0, the timer logic module of PWM0 captures a falling edge, **CFISO** cannot be set to 1, the up-counter is not loaded to 0.

9.11.3.11 Interrupt

The PWM supports an interrupt generation when configuring the PWM channel to PWM output or capturing input.

For PWM output function, when the controller outputs one period of PWM waveform in cycle mode, the PIS of the corresponding PWM channel is set to 1; when the controller outputs (PWM_PULNUM+1) periods of PWM waveform in pulse mode, the PIS of the corresponding PWM channel is set to 1.

NOTE

The PIS bit is set to 1 automatically by hardware and cleared by software.

For capturing input function, when the timer logic module of the capture channel0 captures rising edge, and [CRIEO](#) is 1, then [CRISO](#) is set to 1; when the timer logic module of the capture channel0 captures falling edge, and [CFIEO](#) is 1, then [CFISO](#) is set to 1.

9.11.4 Programming Guidelines

The following working mode takes PWM01 as an example, other PWM pairs and PWM01 are consistent.

9.11.4.1 Configuring Clock

- Step 1** PWM gating: When using PWM, write 1 to [PCGR](#)[PWMx_CLK_GATING].
- Step 2** PWM clock source select: Set [PCCR01](#)[PWM01_CLK_SRC] to select HOSC or APB0 clock.
- Step 3** PWM clock divider: Set [PCCR01](#)[PWM01_CLK_DIV_M] to select different frequency division coefficient (1/2/4/8/16/32/64/128/256).
- Step 4** PWM clock bypass: Set [PCGR](#)[PWM_CLK_SRC_BYPASS_TO_PWM] to 1, output the PWM clock after the secondary frequency division to the corresponding PWM output pin.
- Step 5** PWM internal clock configuration: Set [PCR](#)[PWM_PRESCAL_K] to select any frequency division coefficient from 1 to 256.

NOTE

For the channel of complementary output and group mode, firstly, set the same clock configurations (clock source selects APB0, clock division configures the same division factor); secondly, open clock gating at the same time; thirdly, configure PWM parameters; finally, enable PWM output at the same time to ensure each channel sync.

We suggest that the two channels of the same PWM pair cannot subject to two groups because of they have the same first level clock division and gating. If must allocate based on this way, the first level of clock division of the channel used by all groups needs to set to the same coefficient and open gating at the same time. And the total module needs to be reset when the group mode regroup.

9.11.4.2 Configuring PWM

- Step 1** PWM mode: Set [PCR](#)[PWM_MODE] to select cycle mode or pulse mode, if pulse mode, [PCR](#)[PWM_PUL_NUM] needs to be configured.
- Step 2** PWM active level: Set [PCR](#)[PWM_ACT_STA] to select a low level or high level.

- Step 3** PWM duty-cycle: Configure [PPR](#)[PWM_ENTIRE_CYCLE] and [PPR](#)[PWM_ACT_CYCLE] after clock gating is opened.
- Step 4** PWM starting/stopping phase: Configure [PCNTR](#)[PWM_COUNTER_START] after the clock gating is enabled and before the PWM is enabled. You can verify whether the configuration was successful by reading back [PCNTR](#)[PWM_COUNTER_STATUS].
- Step 5** Enable PWM: Configure PER to select the corresponding PWM enable bit; when selecting pulse mode, [PCR](#)[PWM_PUL_START] needs to be enabled.

9.11.4.3 Configuring Deadzone

- Step 1** Set initial value: set
[C:\Users\chenxiaofang\AppData\Roaming\Microsoft\Word\ PWM01 Dead Zone](#) -
[Hlk49450444C:\Users\chenxiaofang\AppData\Roaming\Microsoft\Word\ PWM01 Dead Zone](#) -
[Hlk49450444](#)[PDZINTV01].
- Step 2** Enable Deadzone: set
[C:\Users\chenxiaofang\AppData\Roaming\Microsoft\Word\ PWM01 Dead Zone](#) -
[Hlk49450444C:\Users\chenxiaofang\AppData\Roaming\Microsoft\Word\ PWM01 Dead Zone](#) -
[Hlk49450444](#)[PWM01_DZ_CN].

9.11.4.4 Configuring Capture Input

- Step 1** Enable capture: Configure [CER](#) to enable the corresponding channel.
- Step 2** Capture mode: Configure [CCR](#)[CRLF] and [CCR](#)[CFLF] to select rising edge capture or falling edge capture, configure [CCR](#)[CAPINV] to select whether the input signal does reverse processing.

9.11.5 Register List

| Module Name | Base Address |
|-------------|--------------|
| PWM | 0x02000C00 |

9.11.6 Register Description

9.11.6.1 0x0000 PWM IRQ Enable Register (Default Value: 0x0000_0000)

| Offset:0x0000 | | | Register Name: PIER |
|---------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:20 | / | / | / |
| 19 | R/W | 0x0 | PGIE3 PWM Group 3 Interrupt Enable 0: Disable 1: Enable |
| 18 | R/W | 0x0 | PGIE2 PWM Group 2 Interrupt Enable 0: Disable 1: Enable |
| 17 | R/W | 0x0 | PGIE1 PWM Group 1 Interrupt Enable 0: Disable 1: Enable |
| 16 | R/W | 0x0 | PGIE0 PWM Group 0 Interrupt Enable 0: Disable 1: Enable |
| 15:8 | / | / | / |
| 7 | R/W | 0x0 | PCIE7 PWM Channel 7 Interrupt Enable 0: PWM Channel 7 Interrupt Disable 1: PWM Channel 7 Interrupt Enable |
| 6 | R/W | 0x0 | PCIE6 PWM Channel 6 Interrupt Enable 0: PWM Channel 6 Interrupt Disable 1: PWM Channel 6 Interrupt Enable |
| 5 | R/W | 0x0 | PCIE5 PWM Channel 5 Interrupt Enable 0: PWM Channel 5 Interrupt Disable 1: PWM Channel 5 Interrupt Enable |

| Offset:0x0000 | | | Register Name: PIER |
|---------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 4 | R/W | 0x0 | PCIE4 PWM Channel 4 Interrupt Enable 0: PWM Channel 4 Interrupt Disable 1: PWM Channel 4 Interrupt Enable |
| 3 | R/W | 0x0 | PCIE3 PWM Channel 3 Interrupt Enable 0: PWM Channel 3 Interrupt Disable 1: PWM Channel 3 Interrupt Enable |
| 2 | R/W | 0x0 | PCIE2 PWM Channel 2 Interrupt Enable 0: PWM Channel 2 Interrupt Disable 1: PWM Channel 2 Interrupt Enable |
| 1 | R/W | 0x0 | PCIE1 PWM Channel 1 Interrupt Enable 0: PWM Channel 1 Interrupt Disable 1: PWM Channel 1 Interrupt Enable |
| 0 | R/W | 0x0 | PCIE0 PWM Channel 0 Interrupt Enable 0: PWM Channel 0 Interrupt Disable 1: PWM Channel 0 Interrupt Enable |

9.11.6.2 0x0004 PWM IRQ Status Register (Default Value: 0x0000_0000)

| Offset:0x0004 | | | Register Name: PISR |
|---------------|------------|-------------|---------------------------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:20 | / | / | / |
| 19 | R/W1C | 0x0 | PGIS3 PWM Group 3 Interrupt Status |
| 18 | R/W1C | 0x0 | PGIS2 PWM Group 2 Interrupt Status |
| 17 | R/W1C | 0x0 | PGIS1 PWM Group 1 Interrupt Status |
| 16 | R/W1C | 0x0 | PGIS0 PWM Group 0 Interrupt Status |

| Offset:0x0004 | | | Register Name: PISR |
|---------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 15:8 | / | / | / |
| 7 | R/W1C | 0x0 | <p>PIS7</p> <p>PWM Channel 7 Interrupt Status</p> <p>When the PWM channel 7 counter reaches the Entire Cycle Value, this bit is set 1 by hardware. Writing 1 to clear this bit.</p> <p>Reads 0: PWM channel 7 interrupt is not pending.</p> <p>Reads 1: PWM channel 7 interrupt is pending.</p> <p>Writes 0: No effect.</p> <p>Writes 1: Clear PWM channel 7 interrupt status.</p> |
| 6 | R/W1C | 0x0 | <p>PIS6</p> <p>PWM Channel 6 Interrupt Status</p> <p>When the PWM channel 6 counter reaches the Entire Cycle Value, this bit is set 1 by hardware. Writing 1 to clear this bit.</p> <p>Reads 0: PWM channel 6 interrupt is not pending.</p> <p>Reads 1: PWM channel 6 interrupt is pending.</p> <p>Writes 0: No effect.</p> <p>Writes 1: Clear PWM channel 6 interrupt status.</p> |
| 5 | R/W1C | 0x0 | <p>PIS5</p> <p>PWM Channel 5 Interrupt Status</p> <p>When the PWM channel 5 counter reaches the Entire Cycle Value, this bit is set 1 by hardware. Writing 1 to clear this bit.</p> <p>Reads 0: PWM channel 5 interrupt is not pending.</p> <p>Reads 1: PWM channel 5 interrupt is pending.</p> <p>Writes 0: No effect.</p> <p>Writes 1: Clear PWM channel 5 interrupt status.</p> |
| 4 | R/W1C | 0x0 | <p>PIS4</p> <p>PWM Channel 4 Interrupt Status</p> <p>When the PWM channel 4 counter reaches the Entire Cycle Value, this bit is set 1 by hardware. Writing 1 to clear this bit.</p> <p>Reads 0: PWM channel 4 interrupt is not pending.</p> <p>Reads 1: PWM channel 4 interrupt is pending.</p> <p>Writes 0: No effect.</p> <p>Writes 1: Clear PWM channel 4 interrupt status.</p> |

| Offset:0x0004 | | | Register Name: PISR |
|---------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 3 | R/W1C | 0x0 | <p>PIS3</p> <p>PWM Channel 3 Interrupt Status</p> <p>When the PWM channel 3 counter reaches the Entire Cycle Value, this bit is set 1 by hardware. Writing 1 to clear this bit.</p> <p>Reads 0: PWM channel 3 interrupt is not pending.</p> <p>Reads 1: PWM channel 3 interrupt is pending.</p> <p>Writes 0: No effect.</p> <p>Writes 1: Clear PWM channel 3 interrupt status.</p> |
| 2 | R/W1C | 0x0 | <p>PIS2</p> <p>PWM Channel 2 Interrupt Status</p> <p>When the PWM channel 2 counter reaches the Entire Cycle Value, this bit is set 1 by hardware. Writing 1 to clear this bit.</p> <p>Reads 0: PWM channel 2 interrupt is not pending.</p> <p>Reads 1: PWM channel 2 interrupt is pending.</p> <p>Writes 0: No effect.</p> <p>Writes 1: Clear PWM channel 2 interrupt status.</p> |
| 1 | R/W1C | 0x0 | <p>PIS1</p> <p>PWM Channel 1 Interrupt Status</p> <p>When the PWM channel 1 counter reaches the Entire Cycle Value, this bit is set 1 by hardware. Writing 1 to clear this bit.</p> <p>Reads 0: PWM channel 1 interrupt is not pending.</p> <p>Reads 1: PWM channel 1 interrupt is pending.</p> <p>Writes 0: No effect.</p> <p>Writes 1: Clear PWM channel 1 interrupt status.</p> |
| 0 | R/W1C | 0x0 | <p>PIS0</p> <p>PWM Channel 0 Interrupt Status</p> <p>When the PWM channel 0 counter reaches the Entire Cycle Value, this bit is set 1 by hardware. Writing 1 to clear this bit.</p> <p>Reads 0: PWM channel 0 interrupt is not pending.</p> <p>Reads 1: PWM channel 0 interrupt is pending.</p> <p>Writes 0: No effect.</p> <p>Writes 1: Clear PWM channel 0 interrupt status.</p> |

9.11.6.3 0x0010 PWM Capture IRQ Enable Register (Default Value: 0x0000_0000)

| Offset:0x0010 | | | Register Name: CIER |
|---------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15 | R/W | 0x0 | CFIE7 If the enable bit is set to 1, when the capture channel 7 captures falling edge, it generates a capture channel 7 pending. 0: Capture channel 7 fall lock interrupt disable 1: Capture channel 7 fall lock interrupt enable |
| 14 | R/W | 0x0 | CRIE7 If the enable bit is set to 1, when the capture channel 7 captures rising edge, it generates a capture channel 7 pending. 0: Capture channel 7 rise lock interrupt disable 1: Capture channel 7 rise lock interrupt enable |
| 13 | R/W | 0x0 | CFIE6 If the enable bit is set to 1, when the capture channel 6 captures falling edge, it generates a capture channel 6 pending. 0: Capture channel 6 fall lock interrupt disable 1: Capture channel 6 fall lock interrupt enable |
| 12 | R/W | 0x0 | CRIE6 If the enable bit is set to 1, when the capture channel 6 captures rising edge, it generates a capture channel 6 pending. 0: Capture channel 6 rise lock interrupt disable 1: Capture channel 6 rise lock interrupt enable |
| 11 | R/W | 0x0 | CFIE5 If the enable bit is set to 1, when the capture channel 5 captures falling edge, it generates a capture channel 5 pending. 0: Capture channel 5 fall lock interrupt disable 1: Capture channel 5 fall lock interrupt enable |
| 10 | R/W | 0x0 | CRIE5 If the enable bit is set to 1, when the capture channel 5 captures rising edge, it generates a capture channel 5 pending. 0: Capture channel 5 rise lock interrupt disable 1: Capture channel 5 rise lock interrupt enable |

| Offset:0x0010 | | | Register Name: CIER |
|---------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 9 | R/W | 0x0 | <p>CFIE4</p> <p>If the enable bit is set to 1, when the capture channel 4 captures falling edge, it generates a capture channel 4 pending.</p> <p>0: Capture channel 4 fall lock interrupt disable 1: Capture channel 4 fall lock interrupt enable</p> |
| 8 | R/W | 0x0 | <p>CRIE4</p> <p>If the enable bit is set to 1, when the capture channel 4 captures rising edge, it generates a capture channel 4 pending.</p> <p>0: Capture channel 4 rise lock interrupt disable 1: Capture channel 4 rise lock interrupt enable</p> |
| 7 | R/W | 0x0 | <p>CFIE3</p> <p>If the enable bit is set to 1, when the capture channel 3 captures falling edge, it generates a capture channel 3 pending.</p> <p>0: Capture channel 3 fall lock interrupt disable 1: Capture channel 3 fall lock interrupt enable</p> |
| 6 | R/W | 0x0 | <p>CRIE3</p> <p>If the enable bit is set to 1, when the capture channel 3 captures rising edge, it generates a capture channel 3 pending.</p> <p>0: Capture channel 3 rise lock interrupt disable 1: Capture channel 3 rise lock interrupt enable</p> |

| Bit | Read/Write | Default/Hex | Description |
| 15:0 | R | 0x0 | CFLR When the capture channel captures a falling edge, the current value of the 16-bit up-counter is latched to the register. |

Draft Version

9.12 LEDC

9.12.1 Overview

The LEDC is used to control the external LED lamp.

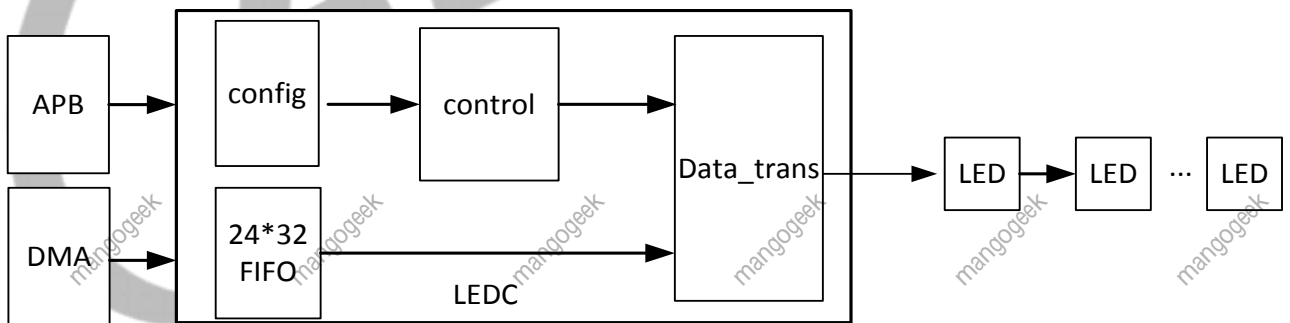

The LEDC has the following features:

- Configurable LED output high-/low-level width
- Configurable LED reset time
- LEDC data supports DMA configuration mode and CPU configuration mode
- Maximum 1024 LEDs serial connect
- LED data transfer rate up to 800 kbit/s
- Configurable RGB display mode
- The default level of non-data output is configurable

9.12.2 Block Diagram

The following figure shows a block diagram of the LEDC.

Figure 9-95 LEDC Block Diagram

LEDC contains the following sub-blocks:

Table 9-34 LEDC Sub-blocks

| Sub-block | Description |
|------------|---|
| config | register configuration |
| control | LEDC timing control and status control |
| FIFO | 24-bit width x 32 depth |
| Data_trans | Convert input data to the 0 and 1 characters of LED |

9.12.3 Functional Description

9.12.3.1 External Signals

The following table describes the external signals of the LEDC.

Table 9-35 LEDC External Signals

| Signal | Description | Type |
|---------|---------------------------------------|------|
| LEDC-DO | Intelligent Control LED Signal Output | O |

9.12.3.2 Clock Sources

The following table describes the clock sources of the LEDC.

Table 9-36 LEDC Clock Sources

| Clock Sources | Description |
|---------------|--|
| HOSC | 24 MHz |
| PLL_PERI(1X) | Peripheral Clock. The default value is 600 MHz |

9.12.3.3 LEDC Timing

Figure 9-96 LEDC Package Output Timing Diagram

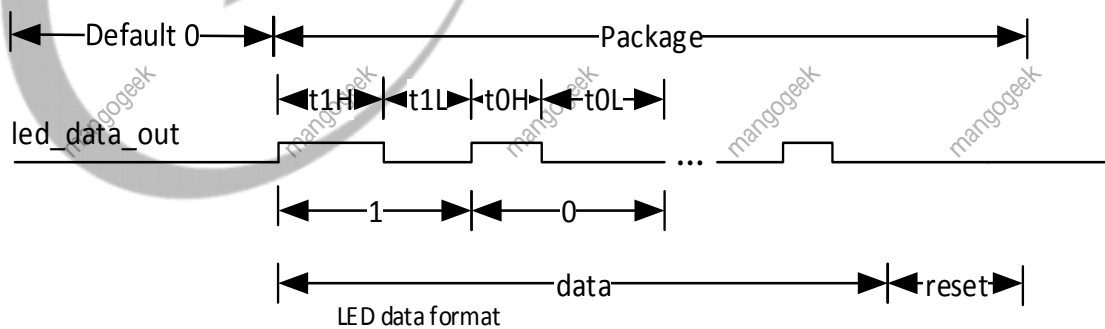

Figure 9-97 LEDC 1-frame Output Timing Diagram

9.12.3.4 LEDC Input Data Structure

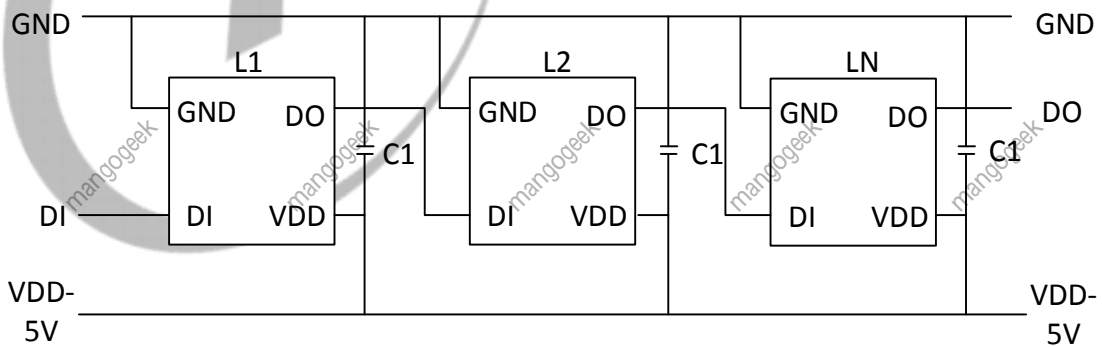

The RGB mode of LEDC data is configurable. By default, the data is sent in GRB order, and the higher bit is transmitted first.

Figure 9-98 LEDC Input Data Structure

9.12.3.5 LEDC Typical Circuit

Figure 9-99 LEDC Typical Circuit

C1 is the bypass capacitor of LED light, and its value is usually 100 nF.

9.12.3.6 LEDC Data Input Code

Figure 9-100 LEDC Data Input Code

9.12.3.7 LEDC Data Transfer Time

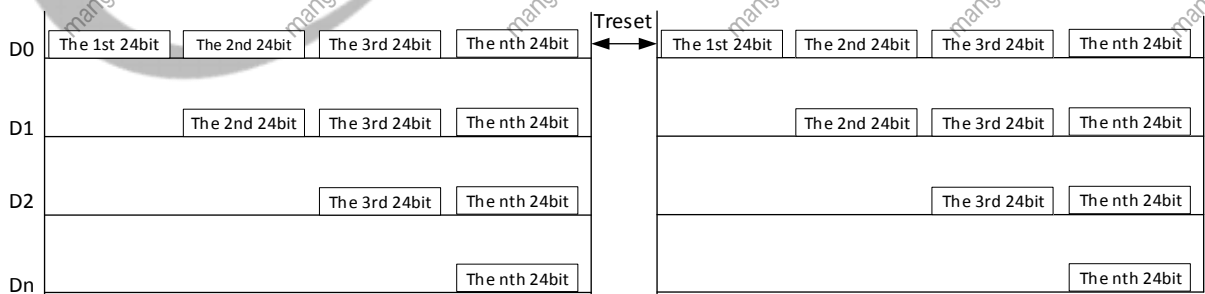

The time parameter of the typical LED specification shows as follows.

Table 9-37 Time Parameters of Typical LED Specification

| | | |
|--------------|----------------------------|------------------|
| T0H | 0 code, high-level time | 220 ns to 380 ns |
| T0L | 0 code, low-level time | 580 ns to 1.6 us |
| T1H | 1 code, high-level time | 580 ns to 1.6 us |
| T1L | 1 code, low-level time | 220 ns to 420 ns |
| RESET | Frame unit, low-level time | > 280 us |

9.12.3.8 LEDC Data Transfer Mode

Figure 9-101 LEDC Data Transfer Mode

9.12.3.9 LEDC Parameter

1. PAD rate > 800 kbit/s

2. LED number supported:

T_{0-code} : 800 ns to 1980 ns, T_{1-code} : 800 ns to 2020 ns

When the LED refresh rate is 30 frame/s, LED number supported is $(1 \text{ s}/30-280 \text{ us})/((800 \text{ ns to } 2020 \text{ ns}) * 24)$
 =1024 +to 681.

When the LED refresh rate is 60 frame/s, LED number supported is $(1 \text{ s}/60-280 \text{ us})/((800 \text{ ns to } 2020 \text{ ns}) * 24)$
 =853 +to 338.

9.12.3.10 LEDC Data Transfer

The LEDC supports DMA data transfer mode or CPU data transfer mode. The DMA data transfer mode is set by LEDC_DMA_EN.

Data transfer in DMA mode

When the valid space of internal FIFO is greater than the setting FIFO free space threshold, the LEDC sends DMA_REQ to require DMA to transfer data from DRAM to LEDC. The maximum data transfer size in DMA mode is 16 words. (The internal FIFO level is 32.)

Data transfer in CPU mode

When the valid space of internal FIFO is greater than the setting FIFO free space threshold, the LEDC sends LEDC_CPUREQ_INT to require CPU to transfer data to LEDC. The transfer data size in CPU mode is controlled by software. The internal FIFO destination address is 0x06700014. The data width is 32-bit. (The lower 24-bit is valid.)

9.12.3.11 LEDC Interrupt

| Module Name | Description |
|-------------------|---|
| FIFO_OVERFLOW_INT | <p>FIFO overflow interrupt.</p> <p>The data written by external is more than the maximum storage space of LED FIFO, the LEDC will be in data loss state. At this time, software needs to deal with the abnormal situation. The processing mode is as follows.</p> <p>The software can query LED_FIFO_DATA_REG to determine which data has been stored in the internal FIFO of LEDC. The LEDC performs soft_reset operation to refresh all data.</p> |

| Module Name | Description |
|-----------------------|--|
| WAITDATA_TIMEOUT_INT | <p>Wait for data timeout interrupt</p> <p>When internal FIFO of LEDC cannot get data because of some abnormal situation, the timeout interrupt is set after led_wait_data_time, now the LEDC is in WAIT_DATA state, and the LEDC outputs a level state configured by LED_POLARITY; in the course of wait_data, if the new data arrives, the LEDC will continue to send data, at this time the software needs to notice whether the waiting time of the LEDC exceeds the operation time of reset. If the waiting time of the LEDC exceeds the operation time of reset (this is equivalent to reset operation sent by LEDC), the LED may enter in refresh state, the data has not been sent.</p> |
| FIFO_CPUREQ_INT | <p>FIFO request CPU data interrupt</p> <p>When FIFO data is less than a threshold, the interrupt will be reported to the CPU.</p> |
| LEDC_TRANS_FINISH_INT | <p>Data transfer complete interrupt</p> <p>The value indicates that the data configured as total_data_length has been transferred completely.</p> |

LEDC interrupt usage scenario:

CPU mode

The software can enable GLOBAL_INT_EN, FIFO_CPUREQ_INT_EN, WAITDATA_TIMEOUT_INT_EN, FIFO_OVERFLOW_INT_EN, LEDC_TRANS_FINISH_INT_EN, and cooperate with LEDC_FIFO_TRIG_LEVEL to use. When FIFO_CPUREQ_INT is set to 1, the software can configure data of LEDC_FIFO_TRIG_LEVEL to LEDC.

DMA mode

The software can enable GLOBAL_INT_EN, WAITDATA_TIMEOUT_INT_EN, FIFO_OVERFLOW_INT_EN, LEDC_TRANS_FINISH_INT_EN, and cooperate with LEDC_FIFO_TRIG_LEVEL to use. When DMA receives LEDC DMA_REQ, DMA can transfer data of LEDC_FIFO_TRIG_LEVEL to LEDC.

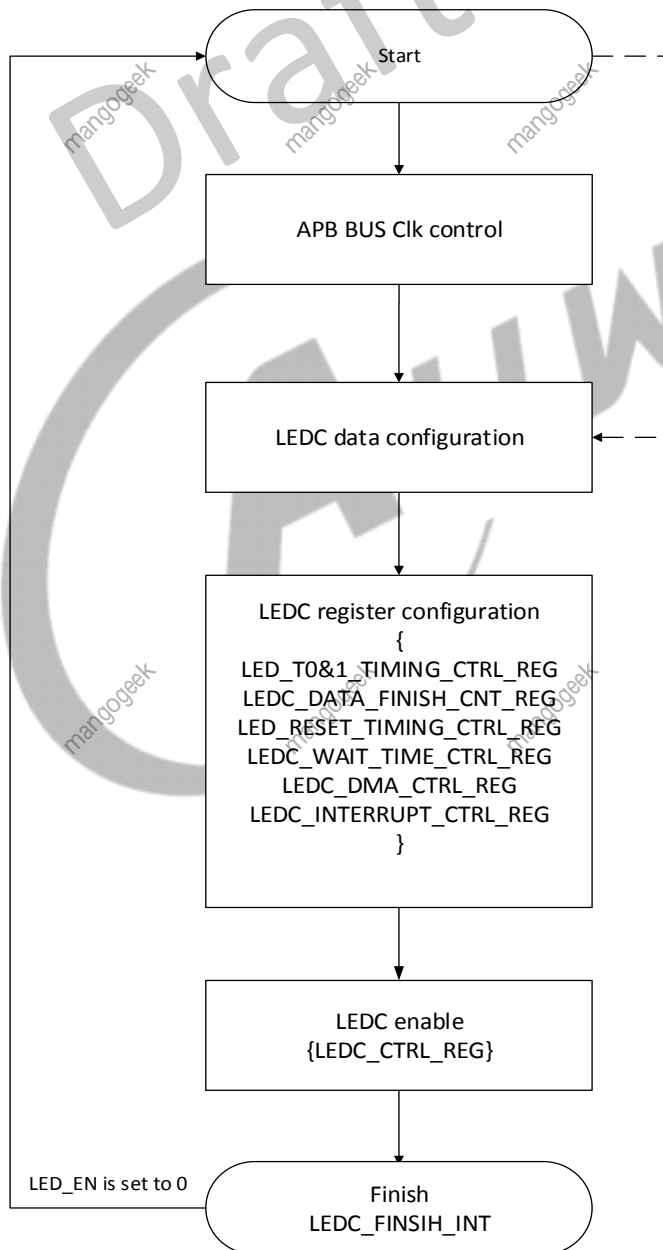

9.12.4 Programming Guidelines

9.12.4.1 LEDC Normal Configuration Process

- Step 1** Configure LEDC_CLK and bus pclk.
- Step 2** Configure the written LEDC data.

- Step 3** Configure [LED_T01_TIMING_CTRL_REG](#), [LEDC_DATA_FINISH_CNT_REG](#), [LED_RESET_TIMING_CTRL_REG](#), [LEDC_WAIT_TIME0_CTRL_REG](#), [LEDC_DMA_CTRL_REG](#), [LEDC_INTERRUPT_CTRL_REG](#). Configure 0-code, 1-code, reset time, LEDC waiting time, and the number of external connected LEDC and the threshold of DMA transfer data.
- Step 4** Configure [LEDC_CTRL_REG](#) to enable LEDC_EN, the LEDC will start to output data.
- Step 5** When the LEDC interrupt is pulled up, it indicates the configured data has transferred complete, at this time LED_EN will be set to 0, and the read/write point of LEDC FIFO is cleared to 0.
- Step 6** Repeat step1, 2, 3, 4 to re-execute a new round of configuration, enable LEDC_EN, the LEDC will start new data transfer.

Figure 9-102 LEDC Normal Configuration Process

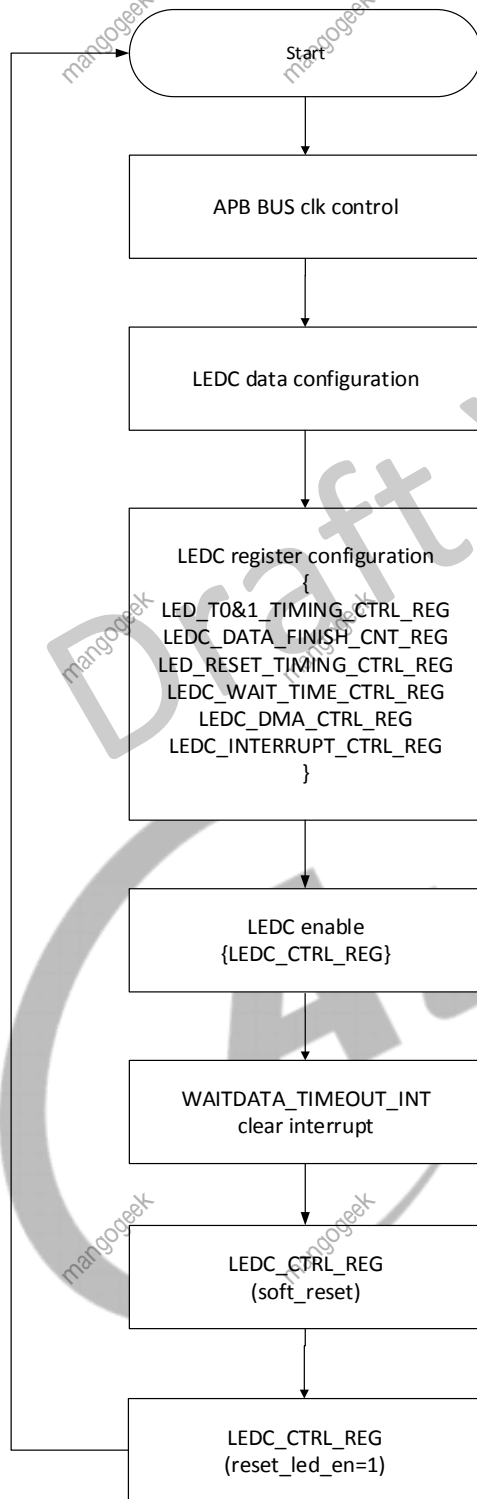

9.12.4.2 LEDC Abnormal Scene Processing Flow

WAITDATA_TIMEOUT Abnormal Status

- Step 1** When WAITDATA_TIMEOUT_INT appears, it indicates the internal FIFO data request of LEDC cannot obtain a response, at this time if the default output level is low, then the external LED may think there was a reset operation and cause LED data to be flushed incorrectly.
- Step 2** The LEDC needs to be performed soft_reset operation (LEDC_SOFT_RESET=1); after soft_reset, the LEDC_EN will be pulled-down automatically, all internal status register and control state machine will return to the idle state, the LEDC FIFO read & write point is cleared to 0, the LEDC interrupt is cleared.
- Step 3** Setting reset_led_en to 1 indicates LEDC can actively send a reset operation to ensure the external LED lamp in the right state.
- Step 4** The software reads the status of reset_led_en, when the status value is 1, it indicates LEDC does not perform the transmission of LED reset operation; when the status value is 0, the LEDC completes the transmission of LED reset operation.
- Step 5** When LEDC reset operation finishes, the LEDC data and register configuration need to be re-operated to start re-transmission data operation.

Figure 9-103 LEDC Timeout Abnormal Processing Flow

FIFO Overflow Abnormal Status

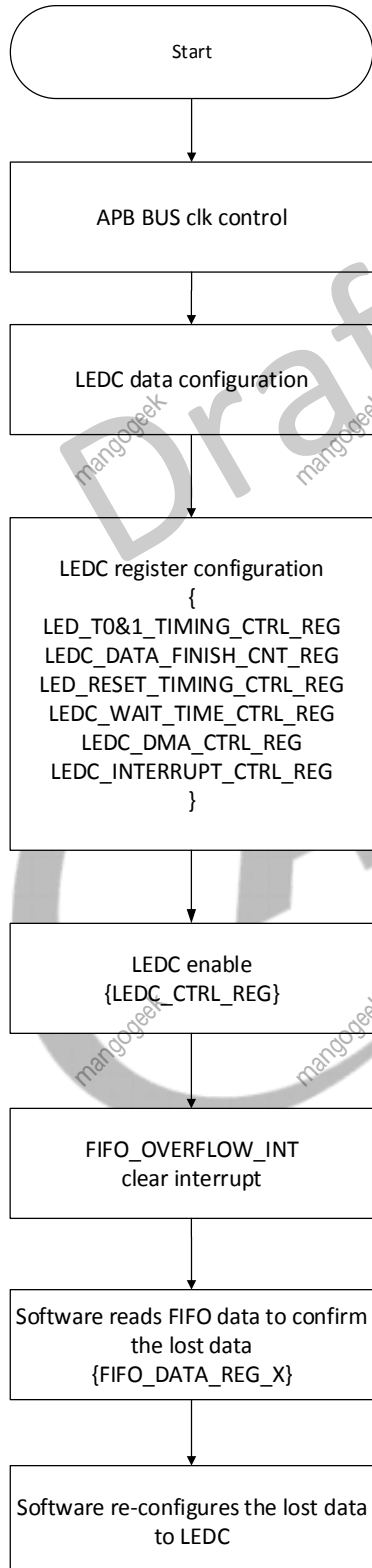

Step 1 When FIFO_OVERFLOW_INT appears, it indicates the data configured by software exceeds the LEDC FIFO space, at this time the redundant data will be lost.

Step 2 The software needs to read data in [LEDC_FIFO_DATA_X](#) to confirm the lost data.

Step 3 The software re-configures the lost data to the LEDC.

Step 4 If the software uses the soft_reset operation, the operation is the same with the timeout abnormal processing flow.

Figure 9-104 FIFO Overflow Abnormal Processing Flow

9.12.5 Register List

| Module Name | Base Address |
|-------------|--------------|
| LEDC | 0x02008000 |

| Register Name | Offset | Description |
|---------------------------|---------------|--------------------------------------|
| LEDC_CTRL_REG | 0x0000 | LEDC Control Register |
| LED_T01_TIMING_CTRL_REG | 0x0004 | LEDC T0 & T1 Timing Control Register |
| LEDC_DATA_FINISH_CNT_REG | 0x0008 | LEDC Data Finish Counter Register |
| LED_RESET_TIMING_CTRL_REG | 0x000C | LEDC Reset Timing Control Register |
| LEDC_WAIT_TIME0_CTRL_REG | 0x0010 | LEDC Wait Time0 Control Register |
| LEDC_DATA_REG | 0x0014 | LEDC Data Register |
| LEDC_DMA_CTRL_REG | 0x0018 | LEDC DMA Control Register |
| LEDC_INT_CTRL_REG | 0x001C | LEDC Interrupt Control Register |
| LEDC_INT_STS_REG | 0x0020 | LEDC Interrupt Status Register |
| LEDC_WAIT_TIME1_CTRL_REG | 0x0028 | LEDC Wait Time1 Control Register |
| LEDC_FIFO_DATA_REG | 0x0030+0x04*N | LEDC FIFO Data Register |

9.12.6 Register Description

9.12.6.1 0x0000 LEDC Control Register (Default Value: 0x0000_003C)

| Offset: 0x0000 | | | Register Name: LEDC_CTRL_REG |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:29 | / | / | / |
| 28:16 | R/W | 0x0 | <p>TOTAL_DATA_LENGTH</p> <p>Total length of transfer data (range: 0 to 8K, unit: 32-bit, only low 24-bit is valid)</p> <p>The field is recommended to be set to an integer multiple of (LED_NUM+1).</p> <p>If TOTAL_DATA_LENGTH is greater than (LED_NUM+1), but non-integer multiple, the last frame of data will transfer data less than (LED_NUM+1).</p> |
| 15:11 | / | / | / |
| 10 | R/W | 0x0 | <p>RESET_LED_EN</p> <p>Write operation:</p> |

| Offset: 0x0000 | | | Register Name: LEDC_CTRL_REG | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

9.13 EMAC

9.13.1 Overview

The Ethernet Medium Access Controller (EMAC) enables a host to transmit and receive data over Ethernet in compliance with the IEEE 802.3-2002 standard. It supports 10/100/1000 Mbit/s external PHY with RMII/RGMII interface in full-duplex and half-duplex modes. The internal DMA is designed for packet-oriented data transfers based on a linked list of descriptors.

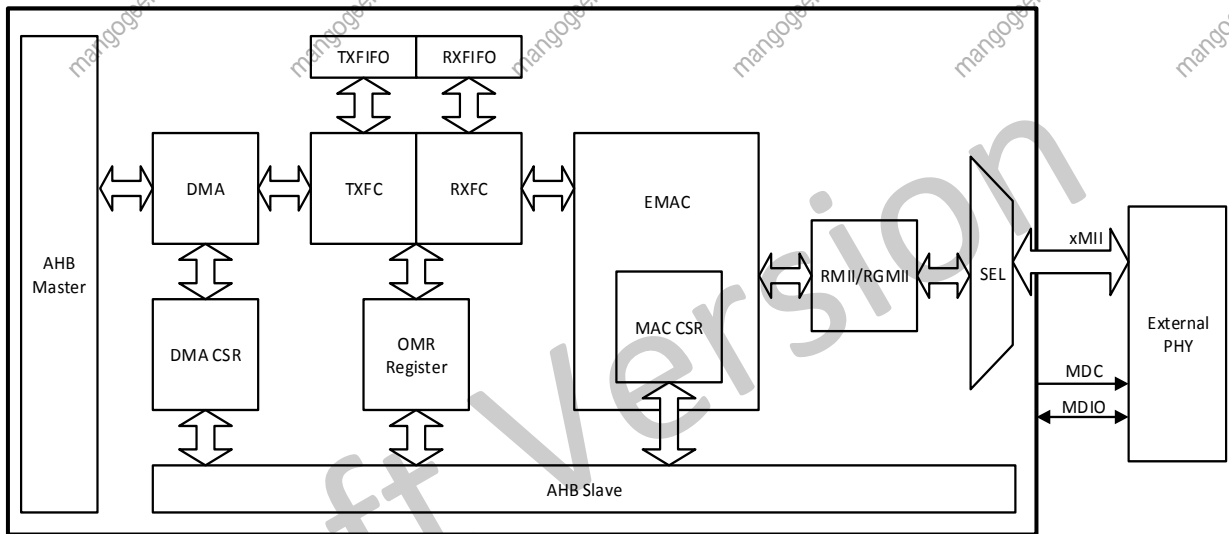

The EMAC has the following features:

- One 10/100/1000 Mbit/s Ethernet port with reduced gigabit media independent interface (RGMII) and reduced media independent interface (RMII) interfaces, for connecting the external EPHY
- Compliant with IEEE 802.3-2002 standard
- Provides the management data input/output (MDIO) interface for PHY device configuration and management with configurable clock frequencies
- Supports both full-duplex and half-duplex operations
- Programmable frame length to support Standard or Jumbo Ethernet frames with sizes up to 16 KB
- Supports a variety of flexible address filtering modes
- Separate 32-bit status returned for transmission and reception packets
- Optimization for packet-oriented DMA transfers with frame delimiters
 - Supports linked-list descriptor list structure
 - Descriptor architecture, allowing large blocks of data transfer with minimum CPU intervention; each descriptor can transfer up to 4 KB of data
 - Comprehensive status reporting for normal operation and transfers with errors
- 4 KB TXFIFO for transmission packets and 16 KB RXFIFO for reception packets
- Programmable interrupt options for different operational conditions

9.13.2 Block Diagram

The following figure shows the block diagram of EMAC.

Figure 9-105 EMAC Block Diagram

9.13.3 Functional Description

9.13.3.1 External Signals

The following table describes the pin mapping of EMAC.

Table 9-38 EMAC Pin Mapping

| Pin Name | RGMII | RMII |
|--------------------------|-------|--------|
| RGMII-RXD3 | RXD3 | / |
| RGMII-RXD2 | RXD2 | / |
| RGMII-RXD1/RMII-RXD1 | RXD1 | RXD1 |
| RGMII-RXD0/RMII-RXD0 | RXD0 | RXD0 |
| RGMII-RXCK | RXCK | / |
| RGMII-RXCTRL/RMII-CRS-DV | RXCTL | CRS-DV |
| RGMII-TXD3 | TXD3 | / |
| RGMII-TXD2 | TXD2 | / |
| RGMII-TXD1/RMII-TXD1 | TXD1 | TXD1 |
| RGMII-TXD0/RMII-TXD0 | TXD0 | TXD0 |
| RGMII-TXCK/RMII-TXCK | TXCK | TXCK |
| RGMII-TXCTRL/RMII-TXEN | TXCTL | TXEN |
| RGMII-CLKIN/ RMII-RXER | CLKIN | RXER |
| MDC | MDC | MDC |
| MDIO | MDIO | MDIO |

| Pin Name | RGMII | RMII |
|----------|----------|----------|
| EPHY-25M | EPHY-25M | EPHY-25M |

The following table describes the pin list of RGMII.

Table 9-39 EMAC RGMII Pin List

| Pin Name | Description | Type |
|----------------|---------------------------------------|------|
| RGMII-TXD[3:0] | EMAC RGMII transmit data | O |
| RGMII-TXCTRL | EMAC RGMII transmit control | O |
| RGMII-TXCK | EMAC RGMII transmit clock | O |
| RGMII-RXD[3:0] | EMAC RGMII receive data | I |
| RGMII-RXCTRL | EMAC RGMII receive control | I |
| RGMII-RXCK | EMAC RGMII receive clock | I |
| RGMII-CKIN | EMAC RGMII 125M reference clock input | I |
| MDC | EMAC management data clock | O |
| MDIO | EMAC management data input output | I/O |
| EPHY-25M | 25 MHz output for EMAC PHY | O |

The following table describes the pin list of RMII.

Table 9-40 EMAC RMII Pin List

| Pin Name | Description | Type |
|---------------|-----------------------------------|------|
| RMII-TXD[1:0] | EMAC RMII transmit data | O |
| RMII-TXEN | EMAC RMII transmit enable | O |
| RMII-TXCK | EMAC RMII transmit clock | I |
| RMII-RXD[1:0] | EMAC RMII receive data | I |
| RMII-CRS-DV | EMAC RMII receive data valid | I |
| RMII-RXER | EMAC RMII receive error | I |
| MDC | EMAC management data clock | O |
| MDIO | EMAC management data input output | I/O |
| EPHY-25M | 25 MHz output for EMAC PHY | O |

9.13.3.2 Clock Characteristics

The following table describes the clock of EMAC.

Table 9-41 EMAC Clock Characteristics

| Clock Name | Description | Type |
|------------------------|--|------|
| RGMII0-TXCK/RMII0-TXCK | In RGMII mode, output 2.5 MHz/25 MHz/125 MHz. In RMII mode, input 5 MHz/50 MHz. | O/I |
| RGMII0-RXCK | In RGMII mode, input 2.5 MHz/25 MHz/125 MHz. In RMII mode, no input. | I |
| RGMII0-CLKIN | In RGMII mode, input 125M Reference Clock. In RMII mode, no clock. | I |

9.13.3.3 Typical Application

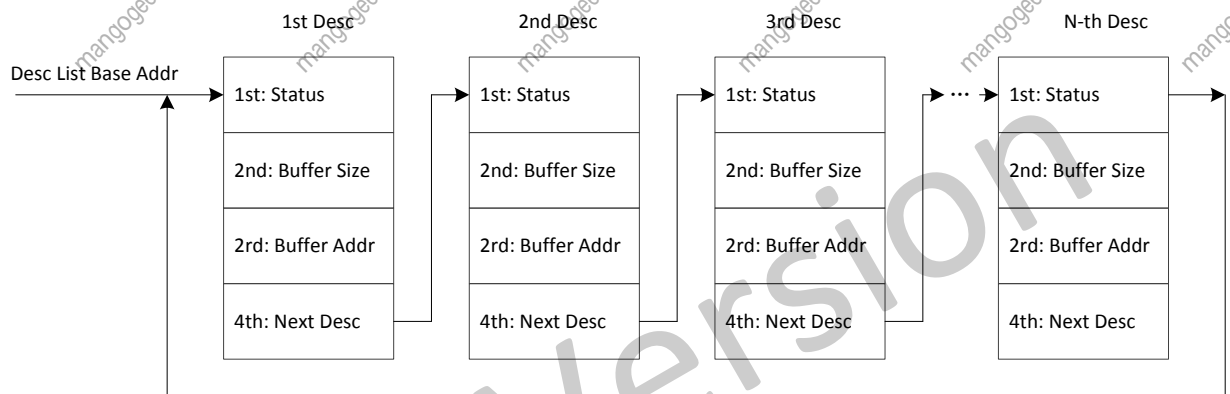

Figure 9-106 EMAC Typical Application

9.13.3.4 EMAC RX/TX Descriptor

The internal DMA of EMAC transfers data between host memory and internal RX/TX FIFO by a linked list of descriptors. Each descriptor consists of four words and contains some necessary information to transfer TX and RX frames. The following figure shows the descriptor list structure. The address of each descriptor must be 32-bit aligned.

Figure 9-107 EMAC RX/TX Descriptor List

9.13.3.5 TX Descriptor

1st Word of TX Descriptor

| Bits | Description |
|-------|---|
| 31 | TX_DESC_CTL When set, the current descriptor can be used by DMA. This bit is cleared by DMA when the whole frame is transmitted or all data in the buffer of the current descriptor are transmitted. |
| 30:17 | Reserved |
| 16 | TX_HEADER_ERR When set, the checksum of the header for the transmitted frame is wrong. |
| 15 | Reserved |
| 14 | TX_LENHT_ERR When set, the length of the transmitted frame is wrong. |
| 13 | Reserved |
| 12 | TX_PAYLOAD_ERR When set, the checksum of the payload for the transmitted frame is wrong. |
| 11 | Reserved |
| 10 | TX_CRD_ERR When set, the carrier is lost during transmission. |
| 9 | TX_COL_ERR_0 When set, the frame is aborted because of a collision after the contention period. |
| 8 | TX_COL_ERR_1 When set, the frame is aborted because of too many collisions. |
| 7 | Reserved |

| Bits | Description |
|------|--|
| 6:3 | TX_COL_CNT The number of collisions before transmission. |
| 2 | TX_DEFER_ERR When set, the frame is aborted because of too much deferral. |
| 1 | TX_UNDERFLOW_ERR When set, the frame is aborted because of the TX FIFO underflow error. |
| 0 | TX_DEFER When set in Half-Duplex mode, the EMAC defers the frame transmission. |

2nd Word of TX Descriptor

| Bits | Description |
|-------|---|
| 31 | TX_INT_CTL When it is set and the current frame has been transmitted, the TX_INT in Interrupt Status Register will be set. |
| 30 | LAST_DESC When it is set, the current descriptor is the last one of the current frame. |
| 29 | FIR_DESC When it is set, the current descriptor is the first one of the current frame. |
| 28:27 | CHECKSUM_CTL These bits control to insert checksum in the transmit frame. |
| 26 | CRC_CTL When it is set, the CRC field is not transmitted. |
| 25:11 | Reserved |
| 10:0 | BUF_SIZE The size of the buffer specified by the current descriptor. |

3rd Word of TX Descriptor

| Bits | Description |
|------|--|
| 31:0 | BUF_ADDR The address of the buffer specified by the current descriptor. |

4th Word of TX Descriptor

| Bits | Description |
|------|--|
| 31:0 | NEXT_DESC_ADDR The address of the next descriptor. It must be 32-bit aligned. |

9.13.3.6 RX Descriptor

1st Word of RX Descriptor

| Bits | Description |
|-------|---|
| 31 | RX_DESC_CTL When it is set, the current descriptor can be used by DMA. This bit is cleared by DMA when the complete frame is received or the buffer of the current descriptor is full. |
| 30 | RX_DAF_FAIL When it is set, the current frame does not pass the DA filter. |
| 29:16 | RX_FRM_LEN When LAST_DESC is not set and no error bit is set, this field is the length of received data for the current frame. When LAST_DESC is set, RX_OVERFLOW_ERR and RX_NO_ENOUGH_BUF_ERR are not set, this field is the length of the received frame. |
| 15 | Reserved |
| 14 | RX_NO_ENOUGH_BUF_ERR When it is set, the current frame is clipped because of no enough buffer. |
| 13 | RX_SAF_FAIL When it is set, the current frame does not pass the SA filter. |
| 12 | Reserved |
| 11 | RX_OVERFLOW_ERR When it is set, a buffer overflow error occurred and the current frame is wrong. |
| 10 | Reserved |
| 9 | FIR_DESC When it is set, the current descriptor is the first descriptor of the current frame. |
| 8 | LAST_DESC When it is set, the current descriptor is the last descriptor of the current frame. |
| 7 | RX_HEADER_ERR When it is set, the checksum of the frame header is wrong. |

| Bits | Description |
|------|--|
| 6 | RX_COL_ERR When it is set, there is a late collision during the reception in half-duplex mode. |
| 5 | Reserved |
| 4 | RX_LENGTH_ERR When it is set, the length of the current frame is wrong. |
| 3 | RX_PHY_ERR When it is set, the receive error signal from PHY is asserted during the reception. |
| 2 | Reserved |
| 1 | RX_CRC_ERR When it is set, the CRC field of the received frame is wrong. |
| 0 | RX_PAYLOAD_ERR When it is set, the checksum or length of the payload for the received frame is wrong. |

2nd Word of RX Descriptor

| Bits | Description |
|-------|---|
| 31 | RX_INT_CTL When it is set and a frame has been received, the RX_INT will not be set. |
| 30:11 | Reserved |
| 10:0 | BUF_SIZE The size of the buffer is specified by the current descriptor. |

3rd Word of RX Descriptor

| Bits | Description |
|------|--|
| 31:0 | BUF_ADDR The address of the buffer specified by the current descriptor. |

4th Word of RX Descriptor

| Bits | Description |
|------|--|
| 31:0 | NEXT_DESC_ADDR The address of the next descriptor. This field must be 32-bit aligned. |

9.13.4 Programming Guidelines

9.13.4.1 EMAC System Configuration

Perform the following steps:

- Step 1** Write 0 to [EMAC_BGR_REG](#)[bit16] to assert the module reset.
- Step 2** Write 1 to [EMAC_BGR_REG](#)[bit16] to deassert the module reset.
- Step 3** Write 1 to [EMAC_BGR_REG](#)[bit0] to enable the bus clock of the module.
- Step 4** Configure the pin interfaces of EMAC by setting GPIO module.
- Step 5** Configure [EMAC_EPHY_CLK_REG0](#) to set the transmission clock source of RGMII/RMII.

For RGMII RXCLK/CLK125M:

In RGMII mode, in addition to the configuration of the transmission clock source, it is generally necessary to adjust the timing by configuring the transmission clock delay, reception clock delay, transmission clock reverse, reception clock reverse.

- Write 0 to the bit[13] and write 1 to the bit[2] to select the RGMII interface.
- If selecting RXCLK as the clock source of RGMII, write 2 to the bit[1:0]; if selecting CLK125M as the clock source of RGMII, write 1 to the bit[1:0].
- Write 0 to the bit[3], write 0 to the bit[4], write 31 to the bit[9:5], and write 7 to the bit[12:10] to transmit the reception sequence adjustment.

For RMII TXCLK:

- Write 1 to the bit[13] and write 0 to the bit[2] to select the RMII interface.
- Write 0 to the bit[0] to select TXCLK as the clock source of RMII.

The configuration value of [EMAC_EPHY_CLK_REG0](#) can refer to the following table.

Table 9-42 EMAC_EPHY_CLK_REG0 Configuration Value

| EMAC_EPHY_CLK_REG0 | PHY_SEL | RMII_EN | ETXDC | ERXDC | ERXIE | ETXIE | RMII/RGMII | ETCS |
|--------------------|---------|---------|------------|----------|-------|-------|------------|----------|
| | Bit15 | Bit13 | Bit[12:10] | Bit[9:5] | Bit4 | Bit3 | Bit2 | Bit[1:0] |
| RGMII | 0 | 0 | 7 | 31 | 0 | 0 | 1 | 1/2 |
| RMII | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |

9.13.4.2 EMAC Initialization

- Step 1** Write 1 to [EMAC_BASIC_CTL1](#)[bit0] to perform the software reset.

- Step 2** Write 1 to [EMAC_BASIC_CTL1](#)[bit1] to set the DMA priority of TX/RX.
- Step 3** Configure [EMAC_TX_CTL1](#) and [EMAC_RX_CTL1](#) to set the configuration of DMA TX and DMA RX.
- Step 4** Configure [EMAC_INT_EN](#) to set the corresponding interrupts and shield the needless interrupts.
- Step 5** Configure [EMAC_TX_DMA_LIST](#) and [EMAC_RX_DMA_LIST](#) to set the first address of the TX descriptor and the RX descriptor, respectively.
- Step 6** Configure [EMAC_TX_CTLO](#) and [EMAC_RX_CTLO](#) to set the TX and RX parameters. Configure [EMAC_BASIC_CTLO](#) to set the speed, duplex mode, loopback configuration. (If enabled the auto-negotiation, the configuration is performed as a result of the negotiation)
- Step 7** Configure [EMAC_RX_FRM_FLT](#) to set the RX frame filter.
- Step 8** Configure [EMAC_TX_FLOW_CTL](#) and [EMAC_RX_CTLO](#) to set the control mechanism of TX and RX.
- Step 9** Clear all interrupt flags.
- Step 10** Write 1 to [EMAC_TX_CTLO](#)[bit31] and write 1 to [EMAC_RX_CTLO](#)[bit31] to enable the TX and RX functions.

9.13.5 Register List

| Module Name | Base Address |
|-------------|--------------|
| EMAC | 0x04500000 |

| Register Name | Offset | Description |
|-----------------------|--------|--|
| EMAC_BASIC_CTLO | 0x0000 | EMAC Basic Control Register0 |
| EMAC_BASIC_CTL1 | 0x0004 | EMAC Basic Control Register1 |
| EMAC_INT_STA | 0x0008 | EMAC Interrupt Status Register |
| EMAC_INT_EN | 0x000C | EMAC Interrupt Enable Register |
| EMAC_TX_CTLO | 0x0010 | EMAC Transmit Control Register0 |
| EMAC_TX_CTL1 | 0x0014 | EMAC Transmit Control Register1 |
| EMAC_TX_FLOW_CTL | 0x001C | EMAC Transmit Flow Control Register |
| EMAC_TX_DMA_DESC_LIST | 0x0020 | EMAC Transmit Descriptor List Address Register |
| EMAC_RX_CTLO | 0x0024 | EMAC Receive Control Register0 |
| EMAC_RX_CTL1 | 0x0028 | EMAC Receive Control Register1 |
| EMAC_RX_DMA_DESC_LIST | 0x0034 | EMAC Receive Descriptor List Address Register |
| EMAC_RX_FRM_FLT | 0x0038 | EMAC Receive Frame Filter Register |
| EMAC_RX_HASH0 | 0x0040 | EMAC Hash Table Register0 |

| Register Name | Offset | Description |
|------------------|--------------------------|---|
| EMAC_RX_HASH1 | 0x0044 | EMAC Hash Table Register1 |
| EMAC_MII_CMD | 0x0048 | EMAC Management Interface Command Register |
| EMAC_MII_DATA | 0x004C | EMAC Management Interface Data Register |
| EMAC_ADDR_HIGH0 | 0x0050 | EMAC MAC Address High Register0 |
| EMAC_ADDR_LOW0 | 0x0054 | EMAC MAC Address Low Register0 |
| EMAC_ADDR_HIGHN | 0x0050+0x08*N (N=1-7) | EMAC MAC Address High Register N (N=1-7) |
| EMAC_ADDR_LOWN | 0x0054+0x08*N (N=1-7) | EMAC MAC Address Low Register N (N=1-7) |
| EMAC_TX_DMA_STA | 0x00B0 | EMAC Transmit DMA Status Register |
| EMAC_TX_CUR_DESC | 0x00B4 | EMAC Current Transmit Descriptor Register |
| EMAC_TX_CUR_BUF | 0x00B8 | EMAC Current Transmit Buffer Address Register |
| EMAC_RX_DMA_STA | 0x00C0 | EMAC Receive DMA Status Register |
| EMAC_RX_CUR_DESC | 0x00C4 | EMAC Current Receive Descriptor Register |
| EMAC_RX_CUR_BUF | 0x00C8 | EMAC Current Receive Buffer Address Register |
| EMAC_RGMII_STA | 0x00D0 | EMAC RGMII Status Register |

9.13.6 Register Description

9.13.6.1 0x0000 EMAC Basic Control Register0 (Default Value: 0x0000_0000)

| Offset: 0x0000 | | | Register Name: EMAC_BASIC_CTL0 |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:4 | / | / | / |
| 3:2 | R/W | 0x0 | SPEED EMAC Working Speed 00: 1000 Mbit/s 01: Reserved 10: 10 Mbit/s 11: 100 Mbit/s |
| 1 | R/W | 0x0 | LOOPBACK EMAC Loopback Mode For Test 0: Disable 1: Enable |

| Offset: 0x0000 | | | Register Name: EMAC_BASIC_CTL0 |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 0 | R/W | 0x0 | DUPLEX EMAC Transfer Mode 0: Half-duplex 1: Full-duplex |

9.13.6.2 0x0004 EMAC Basic Control Register1 (Default Value: 0x0800_0000)

| Offset: 0x0004 | | | Register Name: EMAC_BASIC_CTL1 |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:30 | / | / | / |
| 29:24 | R/W | 0x8 | BURST_LEN The burst length of RX and TX DMA transfer. |
| 23:2 | / | / | / |
| 1 | R/W | 0x0 | RX_TX_PRI RX TX DMA Priority 0: Same priority 1: RX priority is over TX |
| 0 | R/W | 0x0 | SOFT_RST Soft Reset all Registers and Logic 0: No valid 1: Reset All clock inputs must be valid before soft reset. This bit is cleared internally when the reset operation is completed fully. Before writing any register, this bit should read a 0. |

9.13.6.3 0x0008 EMAC Interrupt Status Register (Default Value: 0x4000_0000)

| Offset: 0x0008 | | | Register Name: EMAC_INT_STA |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:17 | R | 0x2000 | Reserved |
| 16 | R/W1C | 0x0 | RGMII_LINK_STA_P RMII Link Status Changed Interrupt Pending 0: No Pending 1: Pending Write '1' to clear it. |

| Offset: 0x0008 | | | Register Name: EMAC_INT_STA |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 15:14 | / | / | / |
| 13 | R/W1C | 0x0 | <p>RX_EARLY_P RX DMA Filled First Data Buffer of the Receive Frame Interrupt Pending</p> <p>0: No Pending 1: Pending</p> <p>Write '1' to clear it.</p> |
| 12 | R/W1C | 0x0 | <p>RX_OVERFLOW_P RX FIFO Overflow Error Interrupt Pending</p> <p>0: No Pending 1: Pending</p> <p>Write '1' to clear it.</p> |
| 11 | R/W1C | 0x0 | <p>RX_TIMEOUT_P RX Timeout Interrupt Pending</p> <p>0: No Pending 1: Pending</p> <p>Write '1' to clear it. When this bit is asserted, the length of the received frame is greater than 2048 bytes (10240 when JUMBO_FRM_EN is set)</p> |
| 10 | R/W1C | 0x0 | <p>RX_DMA_STOPPED_P When this bit asserted, the RX DMA FSM is stopped.</p> |
| 9 | R/W1C | 0x0 | <p>RX_BUF_UA_P RX Buffer UA Interrupt Pending</p> <p>0: No Pending 1: Pending</p> <p>Write '1' to clear it. When this bit is asserted, the RX DMA cannot acquire the next RX descriptor and RX DMA FSM is suspended. The ownership of the next RX descriptor should be changed to RX DMA. The RX DMA FSM will resume when the RX_DMA_START is written or the next receive frame is coming.</p> |
| 8 | R/W1C | 0x0 | <p>RX_P Frame RX Completed Interrupt Pending</p> <p>0: No Pending 1: Pending</p> <p>Write '1' to clear it. When this bit is asserted, a frame reception is completed. The RX DMA FSM remains running.</p> |
| 7:6 | / | / | / |

| Offset: 0x0008 | | | Register Name: EMAC_INT_STA |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 5 | R/W1C | 0x0 | <p>TX_EARLY_P</p> <p>Total interrupt pending which the frame is transmitted to FIFO</p> <p>0: No Pending</p> <p>1: Pending</p> <p>Write '1' to clear it.</p> |
| 4 | R/W1C | 0x0 | <p>TX_UNDERFLOW_P</p> <p>TX FIFO Underflow Interrupt Pending</p> <p>0: No Pending</p> <p>1: Pending</p> <p>Write '1' to clear it.</p> |
| 3 | R/W1C | 0x0 | <p>TX_TIMEOUT_P</p> <p>Transmitter Timeout Interrupt Pending</p> <p>0: No Pending</p> <p>1: Pending</p> <p>Write '1' to clear it.</p> |
| 2 | R/W1C | 0x0 | <p>TX_BUF_UA_P</p> <p>TX Buffer UA Interrupt Pending</p> <p>0: No Pending</p> <p>1: Pending</p> <p>When this asserted, the TX DMA can not acquire the next TX descriptor and the TX DMA FSM is suspended. The ownership of the next TX descriptor should be changed to TX DMA. The TX DMA FSM will resume when writing to TX_DMA_START bit.</p> |
| 1 | R/W1C | 0x0 | <p>TX_DMA_STOPPED_P</p> <p>Transmission DMA Stopped Interrupt Pending</p> <p>0: No Pending</p> <p>1: Pending</p> <p>Write '1' to clear it.</p> |
| 0 | R/W1C | 0x0 | <p>TX_P</p> <p>Frame Transmission Interrupt Pending</p> <p>0: No Pending</p> <p>1: Pending</p> <p>Write '1' to clear it.</p> |

9.13.6.4 0x000C EMAC Interrupt Enable Register (Default Value: 0x0000_0000)

| Offset: 0x000C | | | Register Name: EMAC_INT_EN |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:14 | / | / | / |
| 13 | R/W | 0x0 | RX_EARLY_INT_EN Early Receive Interrupt 0: Disable 1: Enable |
| 12 | R/W | 0x0 | RX_OVERFLOW_INT_EN Receive Overflow Interrupt 0: Disable 1: Enable |
| 11 | R/W | 0x0 | RX_TIMEOUT_INT_EN Receive Timeout Interrupt 0: Disable 1: Enable |
| 10 | R/W | 0x0 | RX_DMA_STOPPED_INT_EN Receive DMA FSM Stopped Interrupt 0: Disable 1: Enable |
| 9 | R/W | 0x0 | RX_BUF_UA_INT_EN Receive Buffer Unavailable Interrupt 0: Disable 1: Enable |
| 8 | R/W | 0x0 | RX_INT_EN Receive Interrupt 0: Disable 1: Enable |
| 7:6 | / | / | / |
| 5 | R/W | 0x0 | TX_EARLY_INT_EN Early Transmit Interrupt 0: Disable 1: Enable |
| 4 | R/W | 0x0 | TX_UNDERFLOW_INT_EN Transmit Underflow Interrupt 0: Disable 1: Enable |

| Offset: 0x000C | | | Register Name: EMAC_INT_EN |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 3 | R/W | 0x0 | TX_TIMEOUT_INT_EN Transmit Timeout Interrupt 0: Disable 1: Enable |
| 2 | R/W | 0x0 | TX_BUF_UA_INT_EN Transmit Buffer Available Interrupt 0: Disable 1: Enable |
| 1 | R/W | 0x0 | TX_DMA_STOPPED_INT_EN Transmit DMA FSM Stopped Interrupt 0: Disable 1: Enable |
| 0 | R/W | 0x0 | TX_INT_EN Transmit Interrupt 0: Disable 1: Enable |

9.13.6.5 0x0010 EMAC Transmit Control Register0 (Default Value: 0x0000_0000)

| Offset: 0x0010 | | | Register Name: EMAC_TX_CTL0 |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R/W | 0x0 | TX_EN Enable Transmitter 0: Disable 1: Enable When disabled, the transmission will continue until the current transmission finishes. |
| 30 | R/W | 0x0 | TX_FRM_LEN_CTL Frame Transmit Length Control 0: Up to 2,048 bytes (JUMBO_FRM_EN==0) Up to 10,240 bytes (JUMBO_FRM_EN==1) 1: Up to 16,384 bytes Any bytes after that is cut off. |
| 29:0 | / | / | / |

9.13.6.6 0x0014 EMAC Transmit Control Register1 (Default Value: 0x0000_0000)

| Offset: 0x0014 | | | Register Name: EMAC_TX_CTL1 |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R/W | 0x0 | TX_DMA_START Transmit DMA FSM Start 0: No valid 1: Start It is cleared internally and always read a 0. |
| 30 | R/W | 0x0 | TX_DMA_EN 0: Stop TX DMA after the completion of current frame transmission 1: Start and run TX DMA |
| 29:11 | / | / | / |
| 10:8 | R/W | 0x0 | TX_TH Threshold value of TX DMA FIFO When TX_MD is 0, the transmission starts when the frame size in TX DMA FIFO is greater than the threshold. In addition, the full frames with a length less than the threshold are transferred automatically. 000: 64 001: 128 010: 192 011: 256 Others: Reserved |
| 7:2 | / | / | / |
| 1 | R/W | 0x0 | TX_MD Transmission Mode 0: TX starts after the TX DMA FIFO bytes is greater than the TX_TH 1: TX starts after the TX DMA FIFO is located a full frame |
| 0 | R/WAC | 0x0 | FLUSH_TX_FIFO Flush the data in the TX FIFO 0: Enable 1: Disable |

9.13.6.7 0x001C EMAC Transmit Flow Control Register (Default Value: 0x0000_0000)

| Offset: 0x001C | | | Register Name: EMAC_TX_FLOW_CTL |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R/W | 0x0 | TX_FLOW_CTL_STA This bit indicates a pause frame transmission is in progress. When the configuration of flow control is ready, set this bit to transmit a pause frame in full-duplex mode or activate the backpressure function. After the transmission is completed, this bit will be cleared automatically. Before writing TX_FLOW_CTRL register, this bit must be read as 0. |
| 30:22 | / | / | / |
| 21:20 | R/W | 0x0 | TX_PAUSE_FRM_SLOT The threshold of the pause timer at which the input flow control signal is checked for automatic re-transmission of the pause frame. The threshold values should be always less than PAUSE_TIME. |
| 19:4 | R/W | 0x0 | PAUSE_TIME The pause time field in the transmitted control frame. |
| 3:2 | / | / | / |
| 1 | R/W | 0x0 | ZQP_FRM_EN 0: Disable 1: Enable When set, enable the functionality to generate the Zero-Quanta Pause control frame. |
| 0 | R/W | 0x0 | TX_FLOW_CTL_EN TX Flow Control Enable 0: Disable 1: Enable When set, enable flow control operation to transmit pause frames in full-duplex mode, or enable the back-pressure operation in half-duplex mode. |

9.13.6.8 0x0020 EMAC Transmit DMA Descriptor List Address Register (Default Value: 0x0000_0000)

| Offset: 0x0020 | | | Register Name: EMAC_TX_DMA_LIST |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | TX_DESC_LIST The base address of the transmission descriptor list It must be 32-bit aligned. |

9.13.6.9 0x0024 EMAC Receive Control Register0 (Default Value: 0x0000_0000)

| Offset: 0x0024 | | | Register Name: EMAC_RX_CTL0 |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R/W | 0x0 | RX_EN Enable Receiver 0: Disable receiver after current reception 1: Enable |
| 30 | R/W | 0x0 | RX_FRM_LEN_CTL Frame Receive Length Control 0: Up to 2048 bytes (JUMBO_FRM_EN==0) Up to 10240 bytes (JUMBO_FRM_EN==1) 1: Up to 16384 bytes Any bytes after that is cut off. |
| 29 | R/W | 0x0 | JUMBO_FRM_EN Jumbo Frame Enable 0: Disable 1: Enable Jumbo frames of 9018 bytes without reporting a giant |
| 28 | R/W | 0x0 | STRIP_FCS When set, strip the Pad/FCS field on received frames only when the length of field value is less than or equal to 1500 bytes. |
| 27 | R/W | 0x0 | CHECK_CRC Check CRC Enable 0: Disable 1: Calculate CRC and check the IPv4 Header Checksum |
| 26:18 | / | / | / |
| 17 | R/W | 0x0 | RX_PAUSE_FRM_MD 0: Only detect multicast pause frame specified in the 802.3x standard. 1: In addition to detect multicast pause frame specified in the 802.3x standard, also detect unicast pause frame with the address specified in MAC Address 0 High Register and MAC address 0 Low Register. |
| 16 | R/W | 0x0 | RX_FLOW_CTL_EN When set, enable the functionality that decodes the received pause frame and disable its transmitter for a specified time by pause frame. |
| 15:0 | / | / | / |

9.13.6.10 0x0028 EMAC Receive Control Register1 (Default Value: 0x0000_0000)

| Offset: 0x0028 | | | Register Name: EMAC_RX_CTL1 |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R/W | 0x0 | RX_DMA_START When set, the RX DMA will work. It is cleared internally and always read a 0. |
| 30 | R/W | 0x0 | RX_DMA_EN Receive DMA Enable 0: Stop RX DMA after finishing the received current frame 1: Start and run RX DMA |
| 29:25 | / | / | / |
| 24 | R/W | 0x0 | RX_FIFO_FLOW_CTL Receive FIFO Flow Control Enable 0: Disable 1: Enable, base on RX_FLOW_CTL_TH_DEACT and RX_FLOW_CTL_TH_ACT |
| 23:22 | R/W | 0x0 | RX_FLOW_CTL_TH_DEACT Threshold for Deactivating Flow Control 00: Full minus 1 KB 01: Full minus 2 KB 10: Full minus 3 KB 11: Full minus 4 KB Valid in both half-duplex mode and full-duplex mode. |
| 21:20 | R/W | 0x0 | RX_FLOW_CTL_TH_ACT Threshold for Activating Flow Control 00: Full minus 1 KB 01: Full minus 2 KB 10: Full minus 3 KB 11: Full minus 4 KB Valid in both half-duplex mode and full-duplex mode. |
| 19:6 | / | / | / |

| Offset: 0x0028 | | | Register Name: EMAC_RX_CTL1 |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 5:4 | R/W | 0x0 | <p>RX_TH</p> <p>Threshold for RX DMA FIFO Start</p> <p>00: 64</p> <p>01: 32</p> <p>10: 96</p> <p>11: 128</p> <p>Only valid when RX_MD == 0, the full frames with a length less than the threshold are transferred automatically.</p> |
| 3 | R/W | 0x0 | <p>RX_ERR_FRM</p> <p>0: RX DMA drops frames with error</p> <p>1: RX DMA forwards frames with error</p> |
| 2 | R/W | 0x0 | <p>RX_RUNT_FRM</p> <p>When the bit is set to 1, it indicates forward undersized frames with no error and length less than 64 bytes.</p> |
| 1 | R/W | 0x0 | <p>RX_MD</p> <p>Receive Mode</p> <p>0: RX starts to read after the RX DMA FIFO byte is greater than RX_TH</p> <p>1: RX starts to read after the RX DMA FIFO is located a full frame</p> |
| 0 | R/W | 0x0 | <p>FLUSH_RX_FRM</p> <p>Flush Receive Frames</p> <p>0: Enable when the receive descriptors/buffers are unavailable</p> <p>1: Disable</p> |

9.13.6.11 0x0034 EMAC Receive DMA Descriptor List Address Register (Default Value: 0x0000_0000)

| Offset: 0x0034 | | | Register Name: EMAC_RX_DMA_LIST |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | <p>RX_DESC_LIST</p> <p>The base address of the received descriptor list</p> <p>It must be 32-bit aligned.</p> |

9.13.6.12 0x0038 EMAC Receive Frame Filter Register (Default Value: 0x0000_0000)

| Offset: 0x0038 | | | Register Name: EMAC_RX_FRM_FLT |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R/W | 0x0 | DIS_ADDR_FILTER Disable Address Filter 0: Enable 1: Disable |
| 30:18 | / | / | / |
| 17 | R/W | 0x0 | DIS_BROADCAST Disable Receive Broadcast Frames 0: Receive 1: Drop |
| 16 | R/W | 0x0 | RX_ALL_MULTICAST Receive All Multicast Frames Filter 0: Filter according to HASH_MULTICAST 1: Receive all |
| 15:14 | / | / | / |
| 13:12 | R/W | 0x0 | CTL_FRM_FILTER Receive Control Frames Filter 00: Drop all control frames 01: Drop all control frames 10: Receive all control frames 11: Receive all control frames when passing the address filter |
| 11:10 | / | / | / |
| 9 | R/W | 0x0 | HASH_MULTICAST Filter Multicast Frames Set 0: By comparing the DA field in DA MAC address registers 1: According to the hash table |
| 8 | R/W | 0x0 | HASH_UNICAST Filter Unicast Frames Set 0: By comparing the DA field in DA MAC address registers 1: According to the hash table |
| 7 | / | / | / |

| Offset: 0x0038 | | | Register Name: EMAC_RX_FRM_FLT |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 6 | R/W | 0x0 | SA_FILTER_EN Receive SA Filter Enable 0: Receive frames and update the result of SA filter 1: Update the result of the SA filter. In addition, if the SA field of the received frame does not match the values in SA MAC address registers, drop this frame. |
| 5 | R/W | 0x0 | SA_INV_FILTER Receive SA Invert Filter Set 0: Pass frames whose SA field matches SA MAC address registers 1: Pass frames whose SA field does not match SA MAC address registers |
| 4 | R/W | 0x0 | DA_INV_FILTER 0: Normal filtering of frames is performed 1: Filter both unicast and multicast frames by comparing DA field in inverse filtering mode |
| 3:2 | / | / | / |
| 1 | R/W | 0x0 | FLT_MD 0: If the HASH_MULTICAST or HASH_UNICAST is set, the frame is passed only when it matches the Hash filter 1: Receive the frame when it passes the address register filter or the hash filter (set by HASH_MULTICAST or HASH_UNICAST) |
| 0 | R/W | 0x0 | RX_ALL Receive All Frame 0: Receive the frames that pass the SA/DA address filter 1: Receive all frames and update the result of address filter (pass or fail) in the receive status word |

9.13.6.13 0x0040 EMAC Receive Hash Table Register0 (Default Value: 0x0000_0000)

| Offset: 0x0040 | | | Register Name: EMAC_RX_HASH0 |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | HASH_TAB0 The upper 32 bits of Hash table for the received frame filter. |

9.13.6.14 0x0044 EMAC Receive Hash Table Register1 (Default Value: 0x0000_0000)

| Offset: 0x0044 | | | Register Name: EMAC_RX_HASH1 |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | HASH_TAB1 The lower 32 bits of Hash table for the received frame filter. |

9.13.6.15 0x0048 EMAC MII Command Register (Default Value: 0x0000_0000)

| Offset: 0x0048 | | | Register Name: EMAC_MII_CMD |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:23 | / | / | / |
| 22:20 | R/W | 0x0 | MDC_DIV_RATIO_M MDC Clock Divider Ratio The MDC Clock is divided from the AHB clock. 000: 16 001: 32 010: 64 011: 128 Others: Reserved |
| 19:17 | / | / | / |

| 8:4 | R/W | 0x0 | PHY_REG_ADDR PHY Register Address |
| 3:2 | / | / | / |
| 1 | R/W | 0x0 | MII_WR MII Write and Read 0: Read 1: Write |
| 0 | R/WAC | 0x0 | MII_BUSY MII Status 0: Writing 0 is no valid, and reading 0 indicates the read/write operation is finished 1: Writing 1 starts the read/write operation, and reading 1 indicates busy. |

9.13.6.16 0x004C EMAC MII Data Register (Default Value: 0x0000_0000)

| Offset: 0x004C | | | Register Name: EMAC_MII_DATA |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15:0 | R/W | 0x0 | MII_DATA Write to or read from the register in the selected PHY. |

9.13.6.17 0x0050 EMAC MAC Address High Register0 (Default Value: 0x0000_FFFF)

| Offset: 0x0050 | | | Register Name: EMAC_ADDR_HIGH0 |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15:0 | R/W | 0xFFFF | MAC_ADDR_HIGH0 The upper 16 bits of the 1st MAC address. |

9.13.6.18 0x0054 EMAC MAC Address Low Register0 (Default Value: 0xFFFF_FFFF)

| Offset: 0x0054 | | | Register Name: EMAC_ADDR_LOW0 |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0xFFFFFFFF | MAC_ADDR_LOW0 The lower 32 bits of 1st MAC address. |

9.13.6.19 0x0050+0x08*N EMAC MAC Address High Register N (Default Value: 0x0000_FFFF)

| Offset: 0x0050+0x08*N (N=1-7) | | | Register Name: EMAC_ADDR_HIGHN |
|-------------------------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31 | R/W | 0x0 | MAC_ADDR_CTL MAC Address Valid 0: Not valid 1: Valid |
| 30 | R/W | 0x0 | MAC_ADDR_TYPE MAC Address Type 0: Used to compare with the destination address of the received frame 1: Used to compare with the source address of the received frame |

| Offset: 0x0050+0x08*N (N=1-7) | | | Register Name: EMAC_ADDR_HIGHN |
|-------------------------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 29:24 | R/W | 0x0 | MAC_ADDR_BYTE_CTL MAC Address Byte Control Mask The lower bit of mask controls the lower byte of the MAC address. When the bit of mask is 1, do not compare the corresponding byte. |
| 23:16 | / | / | / |
| 15:0 | R/W | 0xFFFF | MAC_ADDR_HIGH The upper 16 bits of the MAC address. |

9.13.6.20 0x0054+0x08*N EMAC MAC Address Low Register N (Default Value: 0x0000_0000)

| Offset: 0x0054+0x08*N (N=1-7) | | | Register Name: EMAC_ADDR_LOWN |
|-------------------------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | MAC_ADDR_LOWN The lower 32 bits of MAC address N (N: 1-7). |

9.13.6.21 0x00B0 EMAC Transmit DMA Status Register (Default Value: 0x0000_0000)

| Offset: 0x00B0 | | | Register Name: EMAC_TX_DMA_STA |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:3 | / | / | / |
| 2:0 | R | 0x0 | TX_DMA_STA The State of Transmit DMA FSM 000: STOP, when reset or disable TX DMA 001: RUN_FETCH_DESC, fetching TX DMA descriptor 010: RUN_WAIT_STA, waiting for the status of TX frame 011: RUN_TRANS_DATA, passing the frame from host memory to TX DMA FIFO 100: Reserved 101: Reserved 111: RUN_CLOSE_DESC, closing TX descriptor 110: SUSPEND, TX descriptor is unavailable or TX DMA FIFO underflow |

9.13.6.22 0x00B4 EMAC Transmit DMA Current Descriptor Register (Default Value: 0x0000_0000)

| Offset: 0x00B4 | | | Register Name: EMAC_TX_DMA_CUR_DESC |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | TX_DMA_CUR_DESC The address of current transmit descriptor. |

9.13.6.23 0x00B8 EMAC Transmit DMA Current Buffer Address Register (Default Value: 0x0000_0000)

| Offset: 0x00B8 | | | Register Name: EMAC_TX_DMA_CUR_BUF |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | TX_DMA_CUR_BUF The address of current transmit DMA buffer. |

9.13.6.24 0x00C0 EMAC Receive DMA Status Register (Default Value: 0x0000_0000)

| Offset: 0x00C0 | | | Register Name: EMAC_RX_DMA_STA |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:3 | / | / | / |
| 2:0 | R | 0x0 | RX_DMA_STA The State of RX DMA FSM 000: STOP, when reset or disable RX DMA 001: RUN_FETCH_DESC, fetching RX DMA descriptor 010: Reserved 011: RUN_WAIT_FRM, waiting for the frame 100: SUSPEND, RX descriptor is unavailable 101: RUN_CLOSE_DESC, closing RX descriptor 110: Reserved 111: RUN_TRANS_DATA, passing the frame from host memory to RX DMA FIFO |

9.13.6.25 0x00C4 EMAC Receive DMA Current Descriptor Register (Default Value: 0x0000_0000)

| Offset: 0x00C4 | | | Register Name: EMAC_RX_DMA_CUR_DESC |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | RX_DMA_CUR_DESC The address of current receive descriptor |

9.13.6.26 0x00C8 EMAC Receive DMA Current Buffer Address Register (Default Value: 0x0000_0000)

| Offset: 0x00C8 | | | Register Name: EMAC_RX_DMA_CUR_BUF |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | RX_DMA_CUR_BUF The address of current receive DMA buffer |

9.13.6.27 0x00D0 EMAC RGMII Status Register (Default Value: 0x0000_0000)

| Offset: 0x00D0 | | | Register Name: EMAC_RGMII_STA |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:4 | / | / | / |
| 3 | R | 0x0 | RGMII_LINK The link status of the RGMII interface 0: Down 1: Up |
| 2:1 | R | 0x0 | RGMII_LINK_SPD The link speed of the RGMII interface 00: 2.5 MHz 01: 25 MHz 10: 125 MHz 11: Reserved |
| 0 | R | 0x0 | RGMII_LINK_MD The link mode of the RGMII interface 0: Half-Duplex 1: Full-Duplex |

9.14 CIR Receiver

9.14.1 Overview

The Consumer Infrared receiver (CIR_RX) captures pulse from the IR Receiver module and uses the Run-Length Code (RLC) to encode the pulse.

The CIR_RX has the following features:

- Supports CIR remote control receiver
- Supports NEC IR protocol
- 64x8 bits RX FIFO for data buffer
- Programmable RX FIFO thresholds
- Supports interrupt
- Sample clock up to 1 MHz

9.14.2 Block Diagram

Figure 9-108 CIR_RX Block Diagram

The CIR_RX samples the input signal on the programmable frequency and records these samples into RX FIFO when one CIR signal is found on the air. The CIR receiver uses Run-Length Code (RLC) to encode pulse width. The encoded data is buffered in 64 levels and 8-bit width RX FIFO; the MSB bit is used to record the polarity of the receiving CIR signal, the rest 7 bits are used for the length of RLC. The maximum length of the RLC is 128. If the duration of one level (high or low level) is more than 128, another byte is used.

9.14.3 Functional Description

9.14.3.1 External Signals

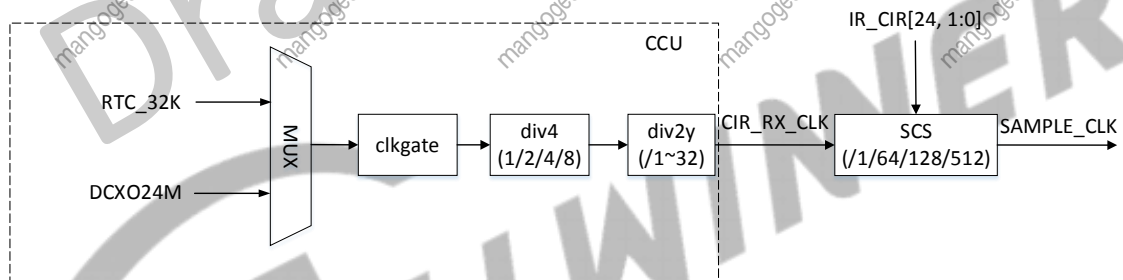

The following table describes the external signals of CIR_RX.

Table 9-43 CIR_RX External Signals

| Signal | Description | Type |
|--------|----------------------------|------|
| IR-RX | Consumer Infrared Receiver | I |

9.14.3.2 Clock Sources

Figure 9-109 CIR_RX Clock System

9.14.3.3 Typical Application

Figure 9-110 CIR_RX Application Diagram

9.14.3.4 NEC Protocol Format

Figure 9-111 NEC Protocol

The CIR receiver module is a timer with a capture function.

When CIR_RX signals satisfy the Active Threshold (ATHR), the CIR receiver can start to capture. In the process, the signal is ignored if the pulse width of the signal is less than NTHR. When CIR_RX signals satisfy ITHR (Idle Threshold), the capture process is stopped and the Receiver Packet End interrupt is generated, then the Receiver Packet End Flag is asserted.

In a capture process, every effective pulse is buffered to FIFO in bytes according to the form of the Run-Length Code. The MSB bit of a byte is the polarity of pulse, and the rest 7 bits is pulse width by taking Sample Clock as a basic unit. This is the code form of the RLC-Byte. When the level changes or the pulse width counter overflows, the RLC-Byte is buffered to FIFO. The CIR_RX module receives the infrared signals transmitted by the infrared remote control, the software decodes the signals.

9.14.3.5 Operating Mode

Sample Clock

Figure 9-112 Logical '0' and Logical '1' of NEC Protocol

For NEC protocol, a logical "1" takes 2.25 ms (560 us+1680 us) to transmit, while a logical "0" is only half of that, being 1.12 ms (560 us+560 us).

For example, if the sample clock is 31.25 kHz, a sample cycle is 32 us, then 18 sample cycles are 560 us. So the RLC of 560 us low level is 0x12 (b'00010010), the RLC of 560 us high level is 0x92 (b'10010010). Then a logical "1" takes code 0x12 (b'00010010) and code 0xb5 (b'10110101) to transmit, a logical "0" takes code 0x12 and code 0x92 to transmit.

Active Threshold (ATHR)

When the CIR receiver is in Idle state, if the electrical level of the CIR_RX signal changes (positive jump or negative jump), and the duration reaches this threshold, then the CIR receiver takes the starting of the signal as a lead code, and the CIR receiver turns into an active state and starts to capture CIR_RX signals.

Figure 9-113 ATHR Definition

Idle Threshold (ITHR)

If the electrical level of CIR_RX signals has no change, and the duration reaches this threshold, then the CIR receiver enters into Idle state and ends this capture.

Figure 9-114 ITHR Definition

Noise Threshold (NTHR)

In the capture process, the pulse is ignored if the pulse width is less than the Noise Threshold.

Figure 9-115 NTHR Definition

Active Pulse Accept Mode (APAM)

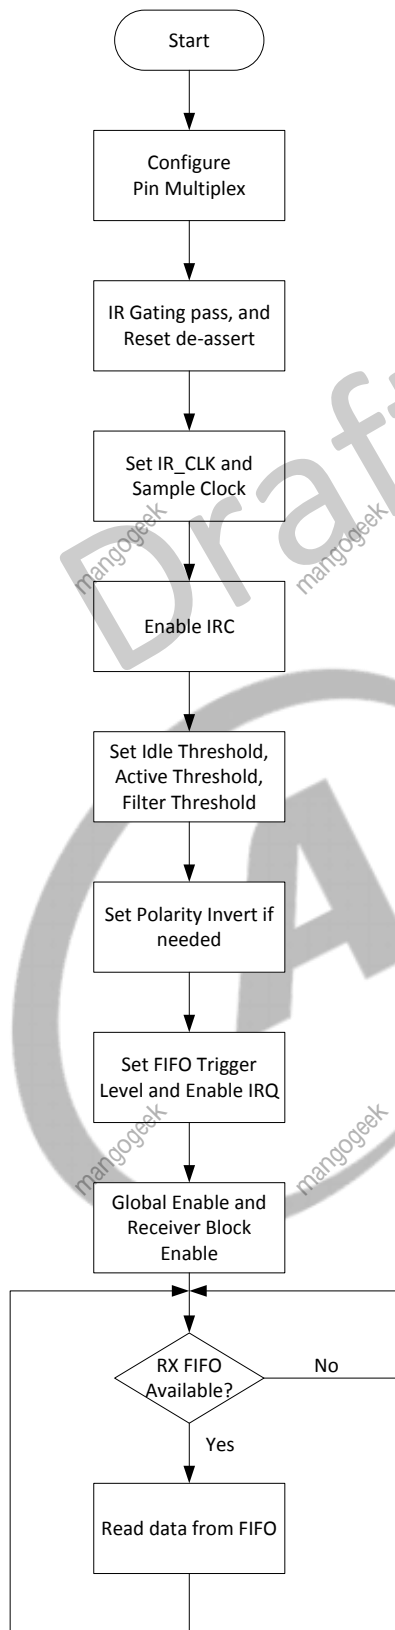

The APAM is used to fit the type of lead code. If a pulse does not fit the type of lead code, it is not regarded as a lead code even if the pulse width reaches ATHR.

Figure 9-116 APAM Definition

9.14.4 Programming Guidelines

9.14.6.6 0x0034 CIR Receiver Configure Register (Default Value: 0x0000_1828)

| Offset: 0x0034 | | | Register Name: CIR_RXCFG |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:25 | / | / | / |
| 24 | R/W | 0x0 | SCS2 Bit2 of Sample Clock Select for CIR This bit is defined by SCS bits below. |
| 23 | R/W | 0x0 | ATHC Active Threshold Control for CIR 0: ATHR in a unit of (Sample Clock) 1: ATHR in a unit of (128*Sample Clocks) |
| 22:16 | R/W | 0x0 | ATHR Active Threshold for CIR These bits control the duration of CIR from the idle to the active state. The duration can be calculated by ((ATHR + 1)*(ATHC? Sample Clock: 128*Sample Clock)). |
| 15:8 | R/W | 0x18 | ITHR Idle Threshold for CIR The Receiver uses it to decide whether the CIR command is received. If there is no CIR signal on the air, the receiver is staying in IDLE status. One active pulse will bring the receiver from IDLE status to Receiving status. After the CIR receiver ends, the inputting signal will keep the specified level (high or low level) for a long time. The receiver can use this idle signal duration to decide that it has received the CIR command. The corresponding flag is asserted. If the corresponding interrupt is enabled, the interrupt line is asserted to the CPU. When the duration of the signal keeps one status (high or low level) for the specified duration ((ITHR + 1)*128 sample_clk), this means that the previous CIR command is finished. |

9.15 CIR Transmitter

9.15.1 Overview

The CIR transmitter (CIR_TX) can transfer arbitrary waves which can be modulated with configurable carrier waves such as 38 kHz.

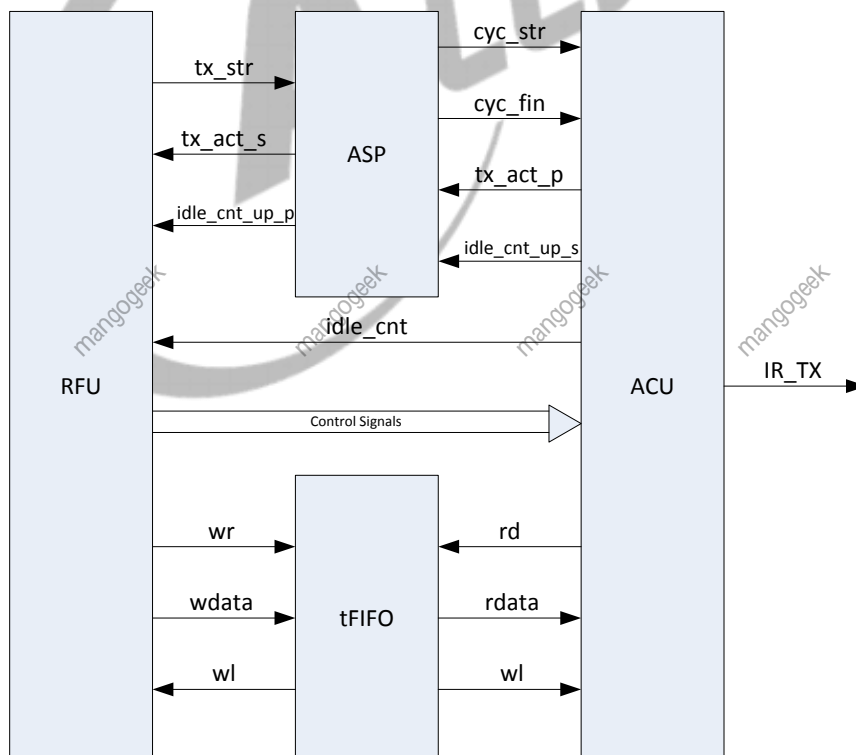

The CIR_TX has the following features:

- Supports CIR remote control transmitter
- 128 bytes FIFO for data buffer
- Configurable carrier frequency
- Supports Interrupt and DMA
- Supports handshake and waiting mode of DMA

9.15.2 Block Diagram

The following figure shows a block diagram of the CIR_TX.

Figure 9-118 CIR_TX Block Diagram

9.15.3 Functional Description

9.15.3.1 External Signals

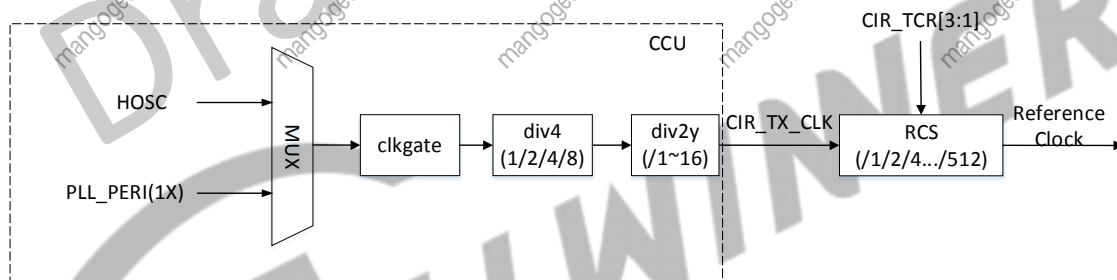

The following table describes the external signals of CIR_TX.

Table 9-44 CIR_TX External Signals

| Signal | Description | Type |
|--------|-------------------------------|------|
| CIR-TX | Consumer infrared transmitter | O |

9.15.3.2 Clock Sources

Figure 9-119 CIR_TX Clock Description

9.15.3.3 Function Implementation

The CIR_TX is used to generate a waveform of arbitrary length, arbitrary shape, and no high-speed requirement, and it can change the data into the high-/low-level sequence of a certain length. Every transmitting data is in bytes, the Bit[7] of a byte means whether the level of a transmitting wave is high or low, the Bit[6:0] is the length of this wave. If the current transmitting frequency-division is 1, 0x88 is a high level of 8 cycles, 0x08 is a low level of 8 cycles. If the current transmitting frequency-division is 4, 0x88 is a high level of 32 cycles, 0x08 is a low level of 32 cycles.

The CIR_TX has two transmission modes: non-cycle transmission, and cycle transmission.

The non-cycle transmission is to transmit all the data in TX_FIFO until the FIFO is empty.

The cycle transmission is to transmit all the data in TX_FIFO, after the transmission completion, wait for a certain time to recover the data in TX_FIFO and then send it until a stop signal is detected. The data recovery in FIFO is implemented by clearing the read pointer.

9.15.3.4 Timing Diagram

The CIR remote control contains many protocols designed by different manufacturers. Here to NEC protocol as an example, the CIR-TX module uses a variable pulse-width modulation technique to encompass the various formats of infrared encoding for remote-control applications. A message is started by a 9 ms AGC burst, which is used to set the gain of the earlier CIR receivers. This AGC burst is then followed by a 4.5 ms space, which is then followed by the address and command.

Bit definition: the logical "1" takes 2.25 ms to transmit, while a logical "0" is only 1.12 ms.

Figure 9-120 Definitions of Logical "1" and Logical "0"

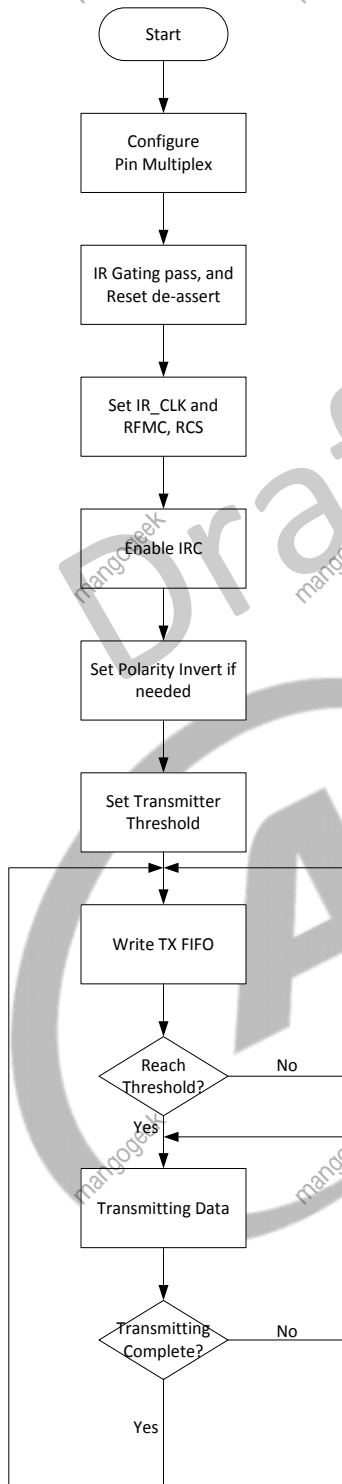

Timing for a message:

10.1 Crypto Engine

10.1.1 Overview

The Crypto Engine (CE) module is one encryption/decryption algorithm accelerator. It supports kinds of symmetric, asymmetric, Hash, and RNG algorithms.

The symmetric algorithm supports data encryption and decryption by following the data encryption standard (DES), 3DES, or advanced encryption standard (AES) algorithms. It can encrypt or decrypt a large amount of data effectively.

The Rivest-Shamir-Adleman (RSA) asymmetric algorithm is used for data encryption/decryption and digital signature verification. It is a public key encryption/decryption algorithm implemented through the modular exponentiation operation.

The Hash algorithm supports data integrity authentication and digital signature. The hash supports MD5, SHA1, SHA224, SHA256, SHA384, SHA512, HMAC-SHA1, and HMAC-SHA256 algorithms.

The RNG algorithm can generate true-random numbers and pseudo-random numbers.

The software interface of the CE is simple, only setting interrupt control, task description address, and load tag. The algorithm control information is written in memory by task descriptor, then the CE automatically reads it when executing a request. It supports parallel execution of 4 channels and has an internal DMA controller to transfer data between CE and memory.

The CE has the following features:

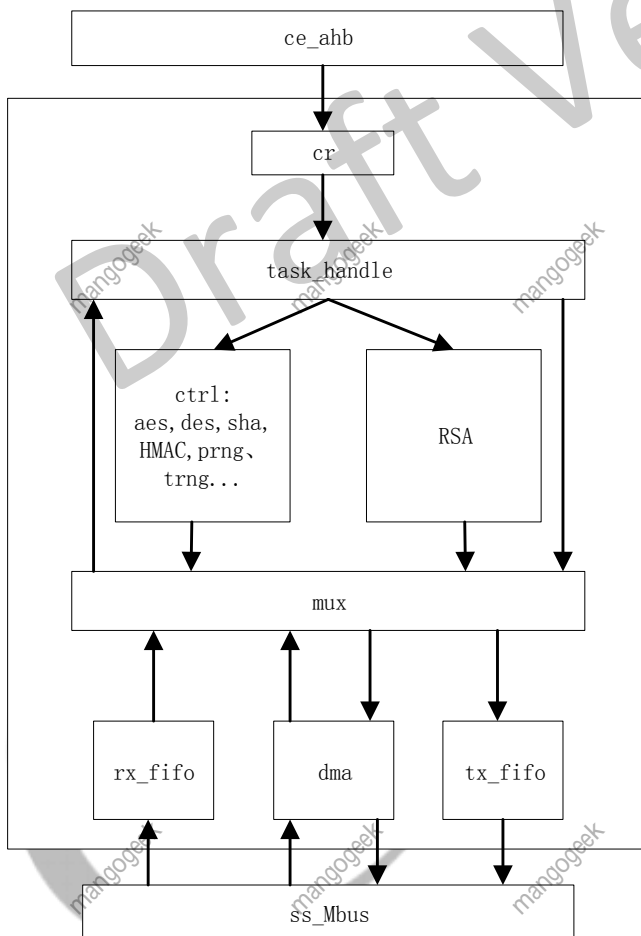

- Symmetrical algorithm: AES, DES, 3DES
- Hash algorithm: MD5, SHA1, SHA224, SHA256, SHA384, SHA512, HMAC-SHA1, HMAC-SHA256
- Asymmetrical algorithm: RSA512/1024/2048-bit
- 160-bit hardware PRNG with 175-bit seed
- 256-bit hardware TRNG
- Electronic codebook (ECB), cipher block chaining (CBC), counter (CTR), cipher text stealing (CTS), 128-output feedback (OFB), 1-/8-/64-/128-cipher feedback (CFB) modes for AES algorithm
- ECB, CBC, CTR modes for DES/3DES algorithm
- 128-, 192-, 256-bit key size for AES algorithms
- 16-, 32-, 64-, 128-bit wide size for AES CTR mode
- 16-, 32-, 64-bit wide size for DES/3DES CTR mode

- One or more blocks mode for MD5/SHA1/SHA224/SHA256/SHA384/SHA512
- Internal DMA controller for data transfer with memory

10.1.2 Block Diagram

The following figure shows the block diagram of Crypto Engine.

Figure 10-1 CE Block Diagram

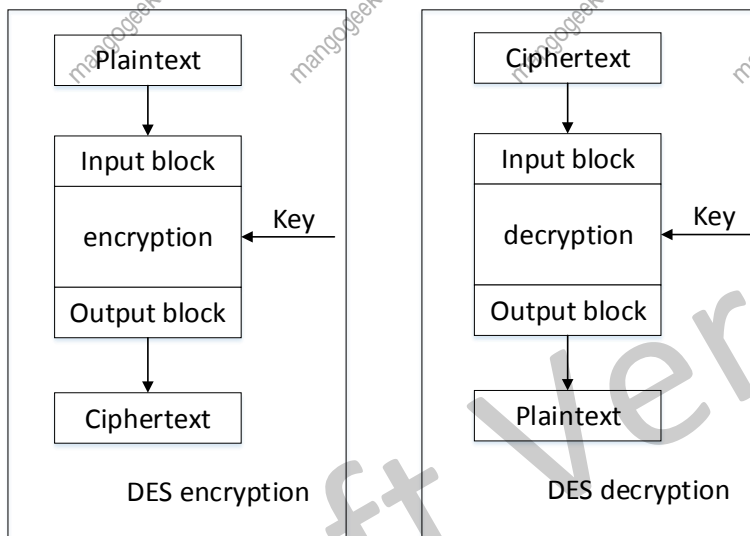

10.1.3 Functional Description

10.1.3.1 DES Algorithm

Figure 10-2 shows the DES encryption and decryption operation.

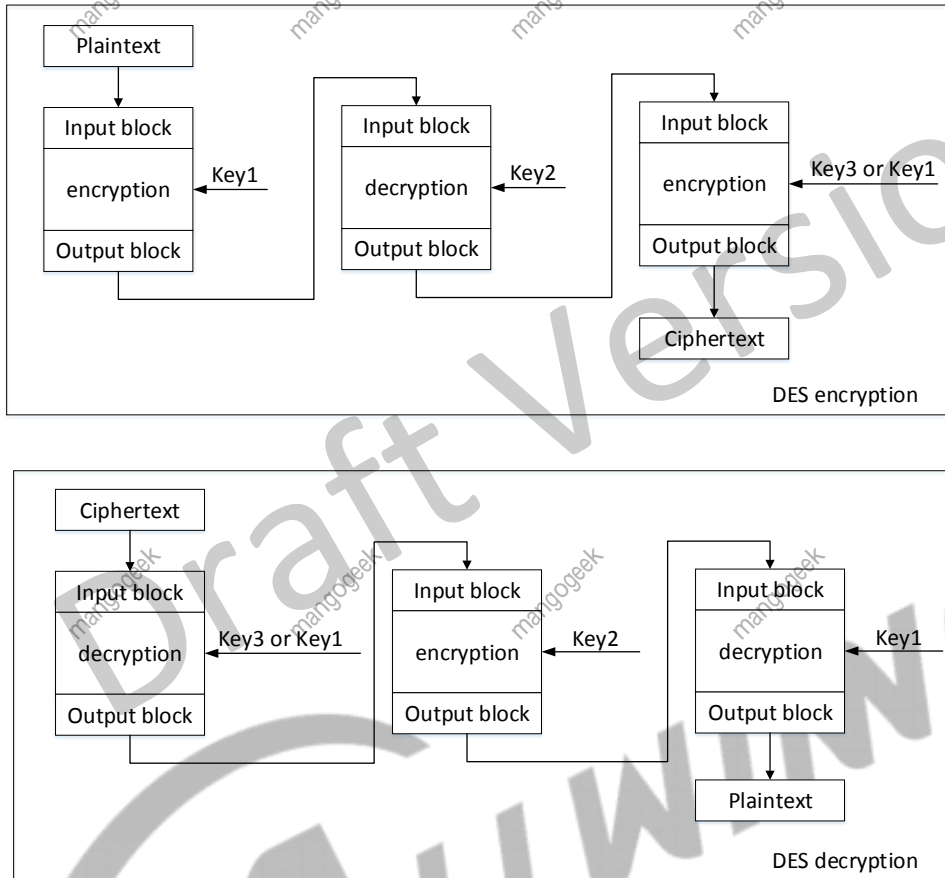

Figure 10-2 DES Encryption and Decryption

10.1.3.2 3DES Algorithm

The 3DES algorithm supports both 3-key and 2-key operations. A 2-key operation can be regarded as a simplified 3-key operation. To be specific, key 3 is represented by key 1 in a 2-key operation. Figure 10-3 shows the 3DES encryption and decryption operation of a 3-key operation and a 2-key operation.

Figure 10-3 3DES Encryption and Decryption of a 3-key Operation and a 2-key Operation

10.1.3.3 ECB Mode

The ECB mode is a confidentiality mode that features, for a given key, the assignment of a fixed ciphertext block to each plaintext block, analogous to the assignment of code words in a codebook.

In ECB mode, encryption and decryption algorithms are directly applied to the block data. The operation of each block is independent, so the plaintext encryption and ciphertext decryption can be performed concurrently.

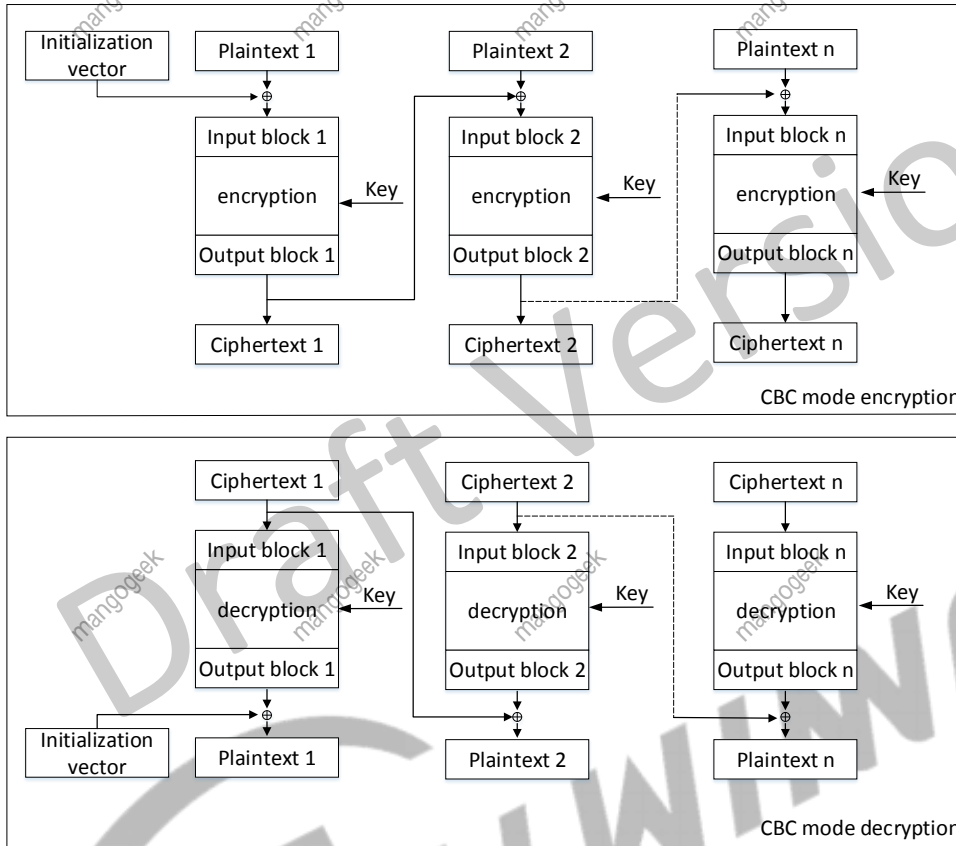

Figure 10-4 ECB Mode Encryption and Decryption

10.1.3.4 CBC Mode

The CBC mode is a confidentiality mode whose encryption process features the combining of the plaintext blocks with the previous ciphertext blocks. The CBC mode requires an initialization vector (IV) to combine with the first plaintext block. The encryption process of each plaintext block is related to the block processing result of the previous ciphertext blocks, so encryption operations cannot be concurrently performed in CBC mode. The decryption operation is independent of output plain text of the previous block, so decryption operations can be performed concurrently.

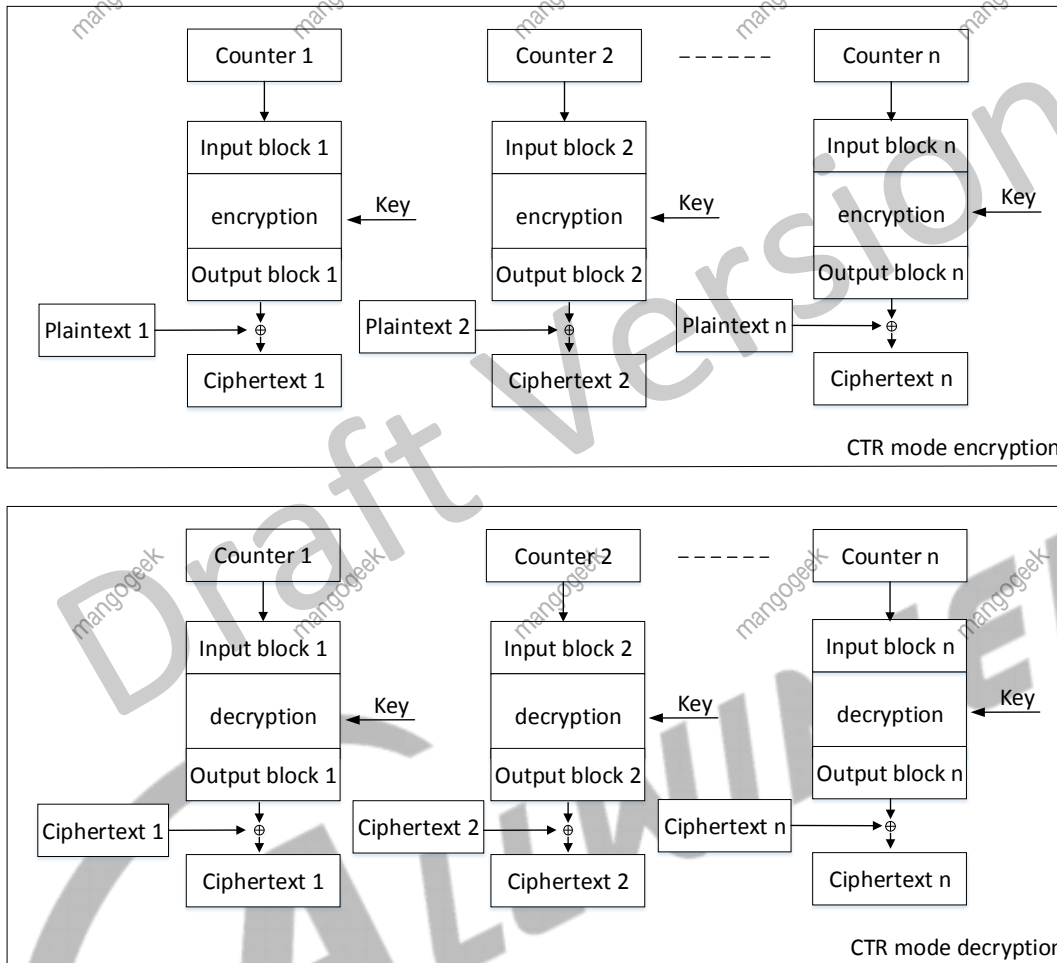

Figure 10-5 CBC Mode Encryption and Decryption

10.1.3.5 CTR Mode

The CTR mode is a confidentiality mode that features the application of the forward cipher to a set of input blocks, called counters, to produce a sequence of output blocks that are exclusive-ORed with the plaintext to produce the ciphertext, and vice versa. All of the counters must be distinct.

Figure 10-6 CTR Mode Encryption and Decryption

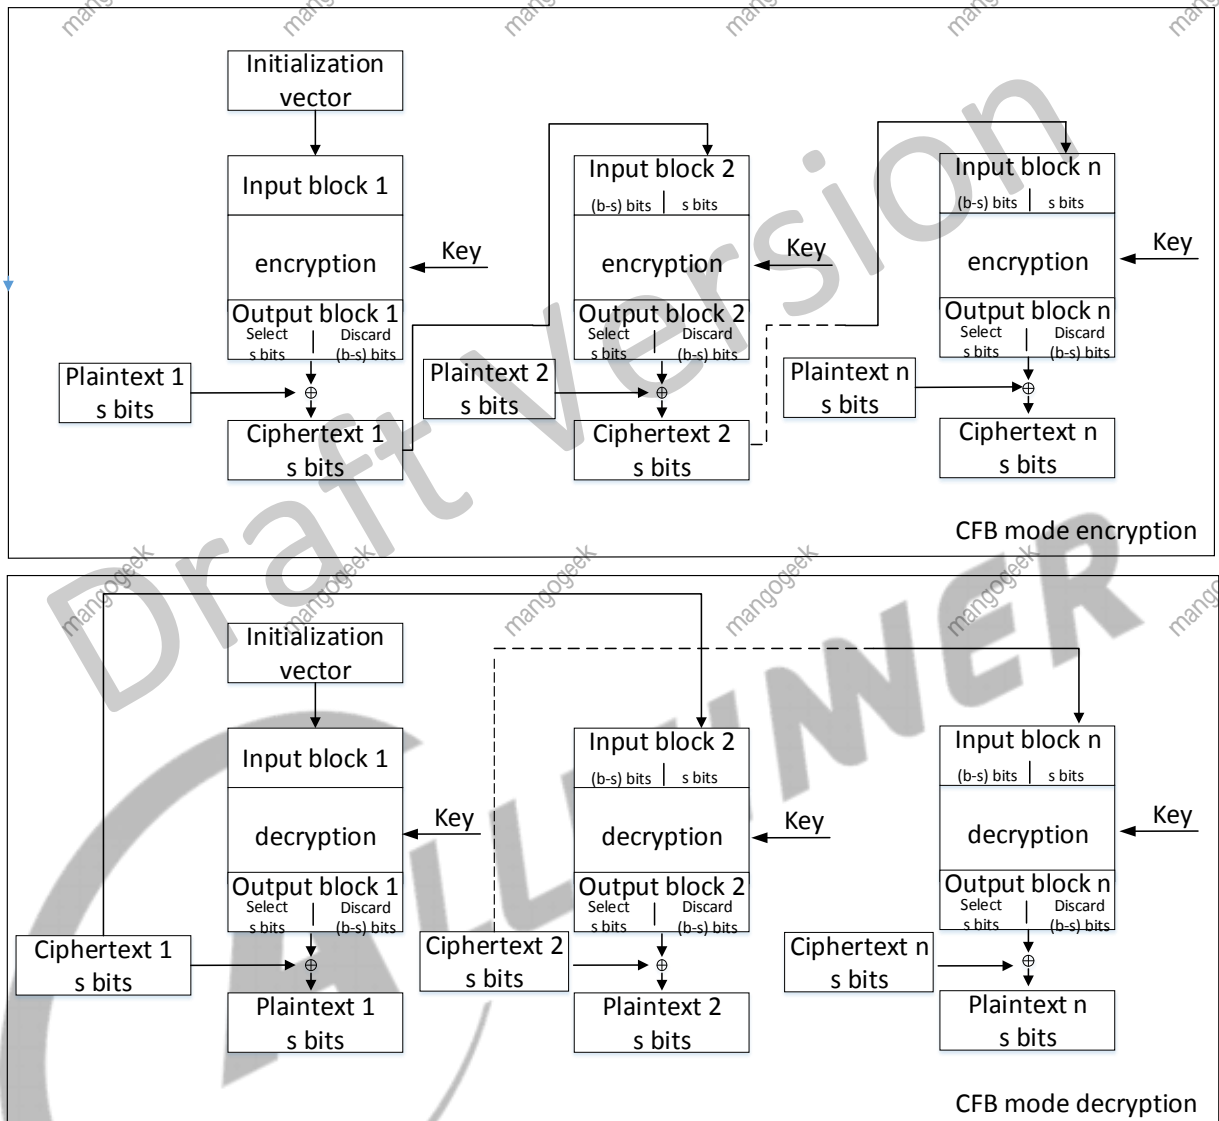

10.1.3.6 CFB Mode

The CFB mode is a confidentiality mode that features the feedback of successive ciphertext segments into the input blocks of the forward cipher to generate output blocks that are exclusive-ORed with the plaintext to produce the ciphertext, and vice versa. The CFB mode requires an IV as the initial input block, and the forward cipher operation is applied to the IV to produce the first output block. The first ciphertext segment is produced by exclusive-ORing the first plaintext segment with the s most significant bits of the first output block. The value of s is 1 bit, 8 bits, 64 bits, or 128 bits.

The following figure shows the s -bit CFB mode of the AES algorithms.

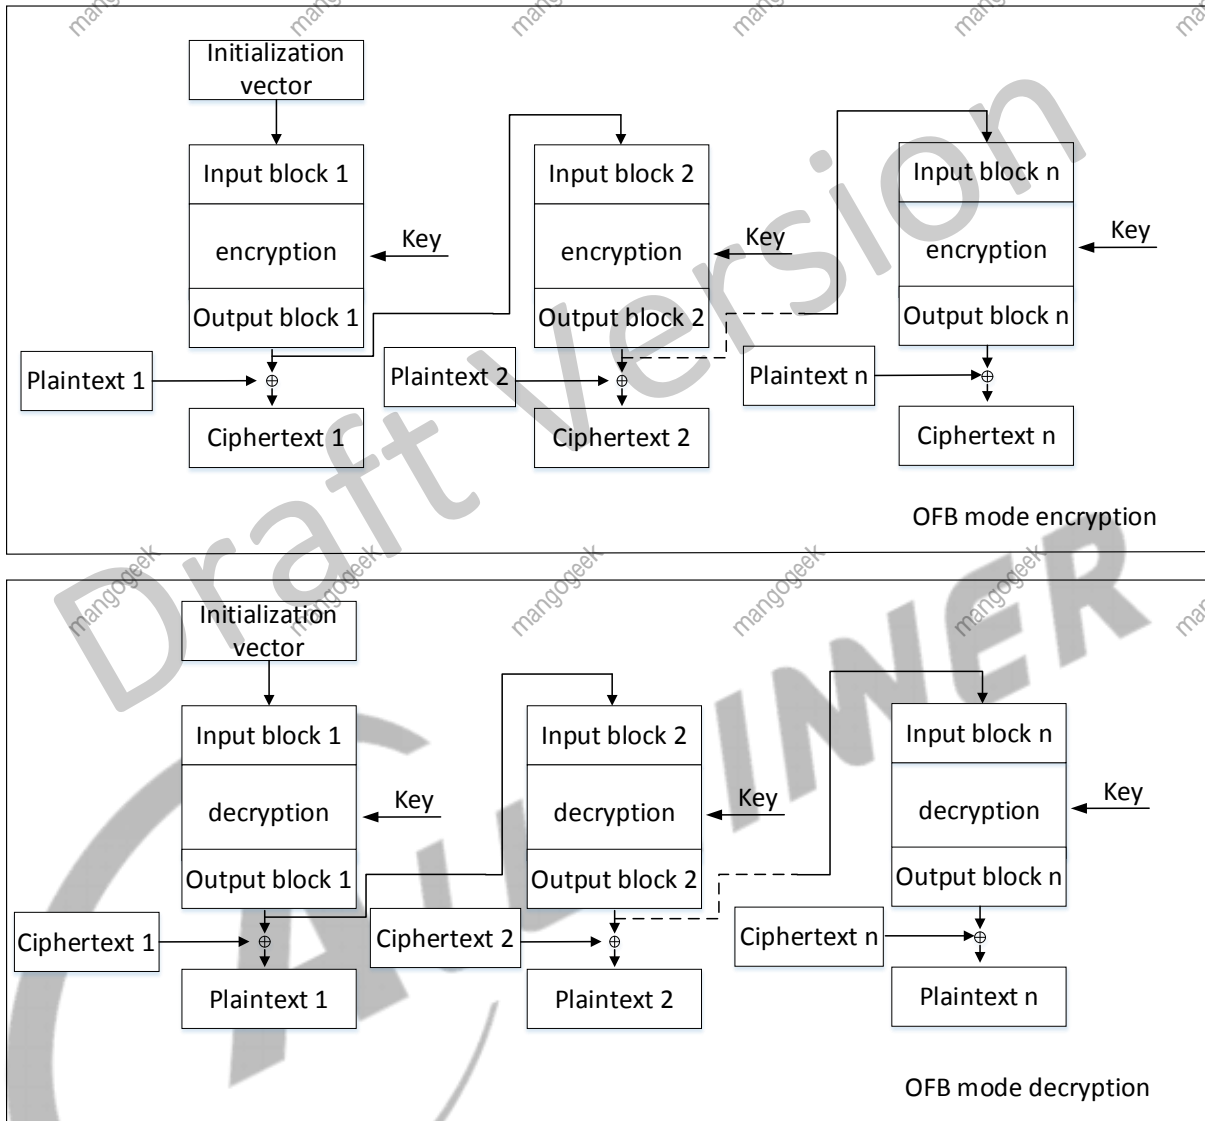

Figure 10-7 CFB Mode Encryption and Decryption

10.1.3.7 OFB Mode

The OFB mode is a confidentiality mode that features the iteration of the forward cipher on an IV to generate a sequence of output blocks that are exclusive-ORed with the plaintext to produce the ciphertext, and vice versa. If a same key is used, different IVs must be used to ensure operation security.

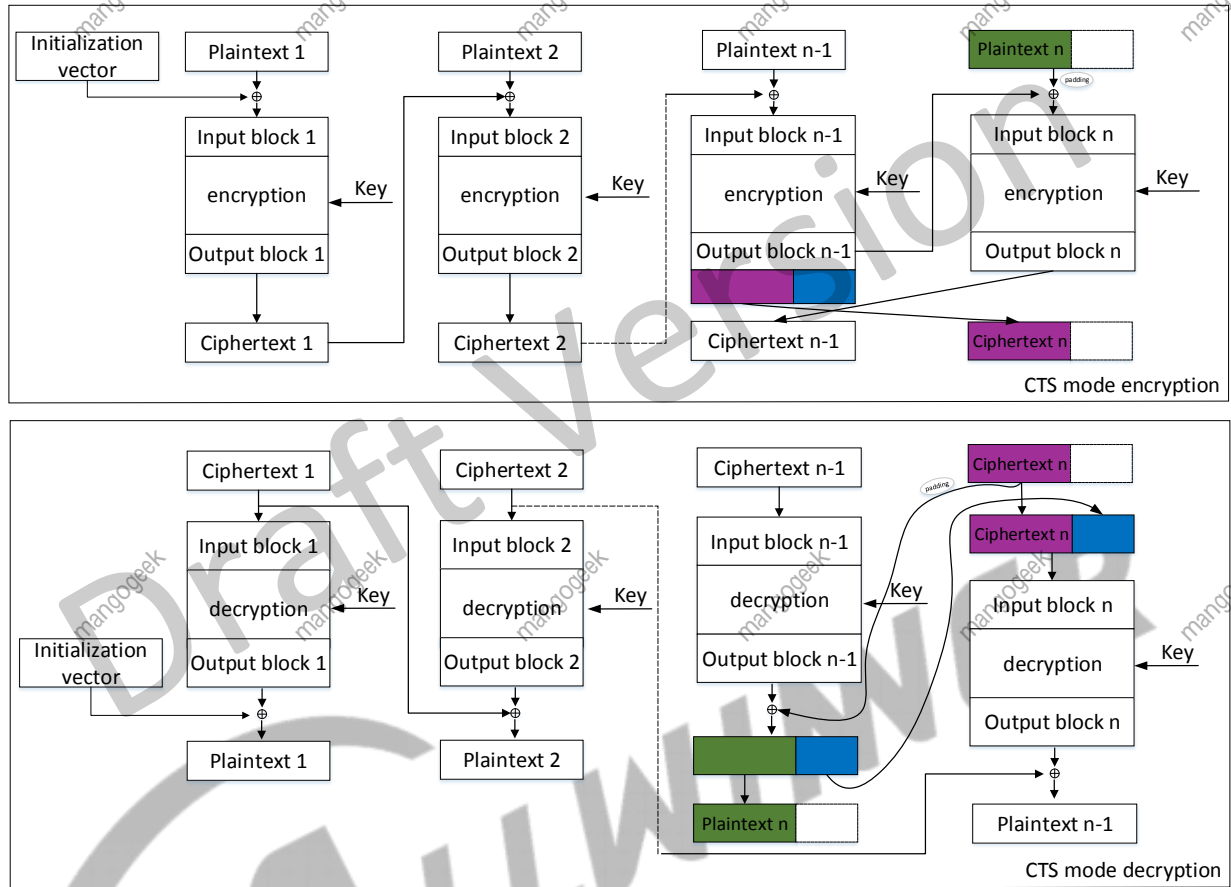

Figure 10-8 OFB Mode Encryption and Decryption

10.1.3.8 CTS Mode

The CTS mode is a confidentiality mode that accepts any plaintext input whose bit length is greater than or equal to the block size but not necessarily a multiple of the block size. Below are the diagrams for CTS encryption and decryption.

Figure 10-9 CTS Mode Encryption and Decryption

10.1.3.9 HASH Algorithm

The hash algorithms support MD5, SHA1, SHA224, SHA256, SHA384, SHA512, HMAC-SHA1, and HMAC-SHA256. All algorithms are iterative, one-way hash functions that can process a message to produce a condensed representation called a *message digest*. When a message is received, the *message digest* can be used to verify whether the data has changed, that is, to verify its integrity.

The hash algorithm of the CE supports block-aligned total length of the input data (padded by software), that is, a multiple of 64 bytes. The message length after padding by software is used as the configured data length for the hash algorithm.

10.1.3.10 RSA Algorithm

The RSA is a public key encryption/decryption algorithm implemented through the modular exponentiation operation.

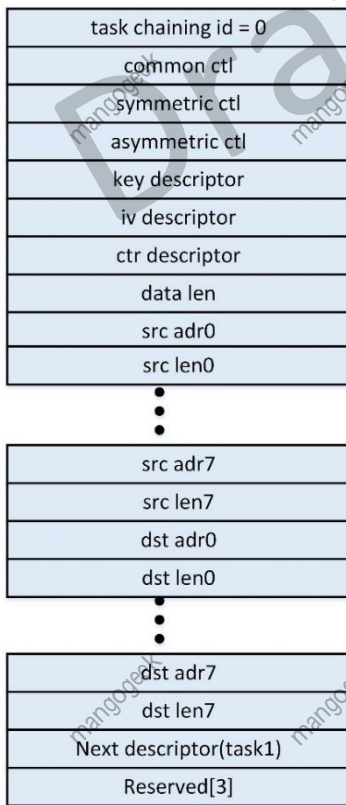

The ciphertext is obtained as follows: $C = M^E \text{ mod } N$. The plaintext is obtained as follows: $M = C^D \text{ mod } N$.

M indicates the plaintext, C indicates the ciphertext, (N, E) indicates the public key, and (N, D) indicates the private key.

10.1.3.11 Task Descriptor

The software makes request through task descriptor, including algorithm type, algorithm mode, key address, source/destination address and size, and so on. The structure of the task descriptor is as follows.

Figure 10-10 Structure of Task Descriptor Chaining

The bit definitions of the task descriptor are as follows.

Task ID

| Bit | Read/Write | Default/Hex | Description |
|------|------------|-------------|-------------|
| 31:4 | / | / | / |

| Bit | Read/Write | Default/Hex | Description |
|-----|------------|-------------|---|
| 3:0 | R/W | 0x0 | <p>CHN</p> <p>Task channel ID</p> <p>Indicates which channel the task is running on.</p> <p>It supports 0 to 3.</p> |

Common Control

| Bit | Read/Write | Default/Hex | Description |
|-------|------------|-------------|---|
| 31 | R/W | 0x0 | <p>Interrupt enable (IE) for the current task</p> <p>0: disable interrupt</p> <p>1: enable interrupt</p> <p>Represents whether an interrupt signal is generated when the task chain ends at the end of this task.</p> <p>When the last task in a task chain ends, the operation of the task chain will end normally; if a task fails in the middle, the task chain will be aborted abnormally. And it is determined whether to generate an interrupt signal according to the IE configuration of the current task when the current task ends or aborts. Therefore, if you want to use interrupts, it is recommended that not only the IE of the last task of each task chain is configured to 1 to generate the end interrupt of the task chain, but also the IEs of other tasks in this task chain are also configured to 1. The purpose is to generate an interrupt signal once an abnormal error occurs in these tasks and the interrupt is aborted.</p> |

Key Descriptor

| Bit | Read/Write | Default/Hex | Description |
|------|------------|-------------|--|
| 31:0 | R/W | 0x0 | Key Address The address of KEY that needs to be stored. |

IV Descriptor

| Bit | Read/Write | Default/Hex | Description |
|------|------------|-------------|--|
| 31:0 | R/W | 0x0 | IV Address The address of IV that needs to be stored. |

Counter Descriptor

| Bit | Read/Write | Default/Hex | Description |
|------|------------|-------------|--|
| 31:0 | R/W | 0x0 | CTR Data Output Address The address of CTR data output that needs to be stored. |

Data Length

| Bit | Read/Write | Default/Hex | Description |
|------|------------|-------------|--|
| 31:0 | R/W | 0x0 | Data Length Configure the data length of the corresponding segment. The data length size needs to be consistent with <code>dst_data_length</code> (destination data length 0 +... + destination data length 7). The data length field in the task descriptor has different meanings for different algorithms. For AES-CTS, the data length field indicates byte numbers of source data, for others indicate word numbers of source data. For PRNG, the data length should be 5 words aligned. For TRNG, it should be 8 words aligned. |

Source Address 0~7

| Bit | Read/Write | Default/Hex | Description |
|------|------------|-------------|--|
| 31:0 | R/W | 0x0 | Source Data Address The address of the source data that needs to be stored. |

Source Data Length 0~7

| Bit | Read/Write | Default/Hex | Description |
|------|------------|-------------|--|
| 31:0 | R/W | 0x0 | Source Data Length The length of the source data. Unit: byte |

Destination Address 0~7

| Bit | Read/Write | Default/Hex | Description |
|------|------------|-------------|--|
| 31:0 | R/W | 0x0 | Destination Data Address The address of the destination data that needs to be stored. |

Destination Data Length 0~7

| Bit | Read/Write | Default/Hex | Description |
|------|------------|-------------|--|
| 31:0 | R/W | 0x0 | Destination Data Length The length of the destination data. Unit: byte |

Next Descriptor Address

| Bit | Read/Write | Default/Hex | Description |
|------|------------|-------------|---|
| 31:0 | R/W | 0x0 | Next Task Address The address where the descriptor of the next task in a task-chain is saved. If there is the only task or the last task of a task-chain, the next task address must be 32'h0. |

10.1.3.12 Storing Message

In the application, a message may not be stored contiguously in the memory, but divided into multiple segments. Or a piece of continuously stored messages can be artificially split into multiple pieces as needs.

Then each segment corresponds to a set of the source address and source length in the descriptor. Multiple segments correspond to groups 0-7 source address/source length in sequence.

Each task supports up to 8 message segments, and the data volume of each message segment supports up to 4 GWord (AES-CTS is 1 GByte). The total amount of all segments in a task (that is a package) supports up to 4 GWord (AES-CTS is 1 GByte). If a message is divided into multiple packages, all others are required to be whole words; when the last package of AES-CTS is less than one word, 0 needs to be padded, and those less than one word are counted as one word. The following figure shows the address order structure.

Figure 10-11 Word Address of Message

Byte order: low byte first, high byte last. When the data is less than one word, the low byte is filled first. The following figure shows the byte order structure (blue means it is filled by the message).

Figure 10-12 Byte Order

Bit order: high bit first, low bit last. When the data is less than one Byte, the high bit is filled first. The following figure shows the bit order structure.

Figure 10-13 Bit Order

10.1.3.13 Storing Key

The length of KEY must be an integer multiple of word, refer to section 10.1.3.15 [“Algorithm Length Properties”](#).

10.1.3.14 Storing IV

For different algorithms, the length of IV is different. But they are integer multiples of word. To keep the byte order of IV and HASH digest output consistent, the byte order of IV is different from that of the message. For the multi-packet operation, the first address of the digest output result of the previous HASH can be directly configured to the first address of the next IV, and the software does not need to do any processing on the digest.

The following figure shows the storage method of 32-bit IV value.

Figure 10-14 The Storage Method of 32-bit IV

The following figure shows the storage method of 64-bit IV value.

Figure 10-15 The Storage Method of 64-bit IV

10.1.3.15 Algorithm Length Properties

The algorithm length has different requirements for different algorithms.

Table 10-1 Symmetric Algorithm Configuration Properties

| Algorithm | Length Setting | | | | Alignment | Software Padding |
|------------------|----------------|------------------|---|--------|--------------|------------------|
| | Source Size | Destination Size | KEY | IV | | |
| AES (except CTS) | < 4 GWord | < 4 GWord | AES-128: 4 Word AES-192: 6 Word AES 256: 8 Word | 4 Word | Word-aligned | need |
| AES-CTS | < 1 GByte | < 1 GByte | AES-128: 4 word AES-192: 6 word AES 256: 8 word | 4 Word | Word-aligned | need |
| DES | < 4 GWord | < 4 GWord | 2 Word | 2 Word | Word-aligned | need |
| TDES | < 4 GWord | < 4 GWord | 6 Word | 2 Word | Word-aligned | need |

Table 10-2 Hash Algorithm Configuration Properties

| Algorithm | Length Setting | | | | Alignment | Software Padding |
|-------------|----------------|------------------|------------|---------|--------------|------------------|
| | Source Size | Destination Size | KEY | IV | | |
| MD5 | < 4 GWord | 4 Word | Fixed to 0 | 4 Word | Word-aligned | need |
| SHA-1 | < 4 GWord | 5 Word | Fixed to 0 | 5 Word | Word-aligned | need |
| SHA-224 | < 4 GWord | 8 Word | Fixed to 0 | 8 Word | Word-aligned | need |
| SHA-256 | < 4 GWord | 8 Word | Fixed to 0 | 8 Word | Word-aligned | need |
| SHA-384 | < 4 GWord | 16 Word | Fixed to 0 | 16 Word | Word-aligned | need |
| SHA-512 | < 4 GWord | 16 Word | Fixed to 0 | 16 Word | Word-aligned | need |
| HMAC-SHA1 | < 4 GWord | 5 Word | 16 Word | 5 Word | Word-aligned | need |
| HMAC-SHA256 | < 4 GWord | 8 Word | 16 Word | 8 Word | Word-aligned | need |

Table 10-3 RNG Configuration Properties

| Algorithm | Length Setting | | | | Alignment | Software Padding |
|-----------|----------------|------------------|------------|--------|--------------|------------------|
| | Source Size | Destination Size | KEY | IV | | |
| TRNG | < 4 GWord | < 4 GWord | Fixed to 0 | 4 Word | Word-aligned | need |
| PRNG | < 4 GWord | < 4 GWord | 6 Word | 4 Word | Word-aligned | need |

Table 10-4 Asymmetric Algorithm Configuration Properties

| Algorithm | Length Setting | | | | Alignment | Software Padding |
|-----------|----------------|------------------|---------|------------|--------------|------------------|
| | Source Size | Destination Size | KEY | IV | | |
| RSA512 | 16 Word | 16 Word | 16 Word | Not use IV | Word-aligned | need |
| RSA1024 | 32 Word | 32 Word | 32 Word | Not use IV | Word-aligned | need |
| RSA2048 | 64 Word | 64 Word | 64 Word | Not use IV | Word-aligned | need |

10.1.3.16 Error Detection

The CE module includes error detection for task configuration, data computing error, and authentication invalid. When the algorithm type in task descriptor is read into the CE module, the CE will check whether this type is supported through checking algorithm type field in common control. If the type value is out of scope, the CE will issue interrupt signal and set error state. Each type has certain input and output data size. After getting a task descriptor, the input size and output size configuration will be checked to avoid size error. If the size configuration is wrong, the CE will issue interrupt signal and set error state.

10.1.3.17 Clock Requirement

| Clock Name | Description | Requirement |
|------------|---------------|------------------|
| hclk | AHB bus clock | 24 MHz – 200 MHz |
| mclk | MBUS clock | 24 MHz – 400 MHz |
| ce_clk | CE work clock | 24 MHz – 400 MHz |

10.1.4 Programming Guidelines

10.1.4.1 Symmetrical/Asymmetrical/Hash/RNG Algorithm Operation Process

The following figure shows the process of an algorithm operation.

Figure 10-16 Task Request Process

- Step 1** The software should configure a task descriptor in memory, including the related fields in the descriptor. The channel id corresponds to one channel in CE. According to algorithm type, the software should set the fields in common control, symmetric control, asymmetric control, then provide key/iv/ctr address and the data length of this task. The source and destination address and size are set based on the upper application. If there is another task concatenating after this task, then set its descriptor address at the next descriptor field. For more details for task descriptor, see section 10.1.4.2, section 10.1.4.3 and section 10.1.4.4.
- Step 2** The software should set registers. Configure the first address of the task descriptor structure to [CE Task Descriptor Address Register](#). Configure the source/destination address to [CE Current Source Address Register](#)/[CE Current Destination Address Register](#).
- Step 3** Enable the end interrupt of the corresponding task channel by setting [CE Interrupt Control Register](#).
- Step 4** The software reads [CE Task Load Register](#) to ensure that the bit0 is 0. If the bit0 is not read out to be 0, wait until it is 0, then configure the bit0 to be 1 to start task.
- Step 5** Wait for interrupt status by reading [CE Interrupt Status Register](#).
- Step 6** Read the result from the destination address.

Step 7 Clear the interrupt.

10.1.4.2 Configuring Task Descriptor of AES

- **Common control:** Configure [Common Control](#)[6:0] to 0x0 to select AES algorithm type.
- **Symmetric control:** According to the corresponding algorithm requirements, configure [Symmetric Control](#) to select the key size, CTR width, CTS last package flag, CFB width, and AES algorithm mode, and so on.
- **Asymmetric control:** The symmetric algorithm does not need to be configured for this field.
- **Key descriptor:** Because the storage of the key requires word alignment, ensure that this descriptor is the first address of the KEY (word address).
- **IV descriptor:** In the task that requires the IV value, configure the first address of the storage space where the IV is stored here. Because the storage of the IV requires word alignment, ensure that this descriptor is the first address of the IV (word address).
- **Data length:** Configure the data length of the corresponding segment. The data length size needs to be consistent with `dst_data_length` (destination data length 0 +... + destination data length 7). When the algorithm is CTS mode, the higher 30-bit of the data length is the word numbers of data volume; when the `data_length[1:0]` is 0, the data length is the higher 30-bit, otherwise it is increased by 1. For AES CTS, the data length indicates the byte numbers of the source data; for other algorithms, it indicates the word numbers.
- **Source address:** The first address of source data segments. Because the storage of the source data requires word alignment, ensure that this descriptor is the first address (word address).
- **Source data length:** The data volume of source data segments. The unit is word, and those less than one word are counted as one word. Note that only the last word of the entire message is allowed to be non-integer words, and the others must be integer words.
- **Destination address:** The first address of destination data segments. Because the storage of the destination data requires word alignment, ensure that this descriptor is the first address (word address).
- **Destination data length:** The data volume of destination data segments. The unit is word, and those less than one word are counted as one word. Note that only the last word of the entire message is allowed to be non-integer words, and the others must be integer words.
- **Next descriptor:** The first address of the next task descriptor. Because the storage of the descriptor requires word alignment, ensure that this descriptor is the first address (word address).
- **Reserved:** Configure to 0x0.

10.1.4.3 Configuring Task Descriptor of HASH

- **Common control**
 - **Algorithm type:** Configure [Common Control](#)[6:0] to select SHA or HMAC algorithm type.
 - **Last HMAC plaintext:** If the algorithm type is HMAC, and the task is the last package of the message or if the message has only one package, then [Common Control](#)[15] needs to set to 1.
 - **IV mode:** The [Common Control](#)[16] (IV MODE) bit is only set to 1 in the following two scenarios, except that the bit must be configured to 0. (1). When the message is split into multiple packages, the [Common Control](#)[16] bit of other packages needs to be set to 1, except that the bit of the first package needs to be cleared to 0. (2). In special applications, if you need to customize the IV value to form the initial value of a certain HASH algorithm, you need to set the [Common Control](#)[16] bit of the first (or only one) package to 1, and the first address of the storage space where the customized IV value is stored in IV address.
- **Key descriptor:** Because the storage of the key requires word alignment, ensure that this descriptor is the first address of the KEY (word address).
- **IV descriptor:** In the task that requires the IV value, configure the first address of the storage space where the IV is stored here. Because the storage of the IV requires word alignment, ensure that this descriptor is the first address of the IV (word address).
- **Data length:** Configure the data length of the corresponding segment. The data length size needs to be consistent with `dst_data_length` (destination data length 0 +... + destination data length 7).
- **Source address:** The first address of source data segments. Because the storage of the source data requires word alignment, ensure that this descriptor is the first address (word address).
- **Source data length:** The data volume of source data segments. The unit is word, and those less than one word are counted as one word. Note that only the last word of the entire message is allowed to be non-integer words, and the others must be integer words.
- **Destination address:** The first address of destination data segments. Because the storage of the destination data requires word alignment, ensure that this descriptor is the first address (word address).
- **Destination data length:** The data volume of destination data segments. The unit is word, and those less than one word are counted as one word. Note that only the last word of the entire message is allowed to be non-integer words, and the others must be integer words.
- **Next descriptor:** The first address of the next task descriptor. Because the storage of the descriptor requires word alignment, ensure that this descriptor is the first address (word address).
- **Reserved:** Configure to 0x0.

10.1.4.4 Configuring Task Descriptor of RSA

- **Common control:** Configure [Common Control](#)[6:0] to 0x20 to select RSA algorithm type.
- **Asymmetric control:** Configure [Asymmetric Control](#)[30:28] to select the RSA width.
- **Key descriptor:** Because the storage of the key requires word alignment, ensure that this descriptor is the first address of the KEY (word address).
- **Data length:** Configure the data length of the corresponding segment. The data length size needs to be consistent with `dst_data_length` (destination data length 0 +... + destination data length 7).
- **Source address:** The first address of source data segments. Because the storage of the source data requires word alignment, ensure that this descriptor is the first address (word address).
- **Source data length:** The data volume of source data segments. The unit is word, and those less than one word are counted as one word. Note that only the last word of the entire message is allowed to be non-integer words, and the others must be integer words.
- **Destination address:** The first address of destination data segments. Because the storage of the destination data requires word alignment, ensure that this descriptor is the first address (word address).
- **Destination data length:** The data volume of destination data segments. The unit is word, and those less than one word are counted as one word. Note that only the last word of the entire message is allowed to be non-integer words, and the others must be integer words.
- **Next descriptor:** The first address of the next task descriptor. Because the storage of the descriptor requires word alignment, ensure that this descriptor is the first address (word address).
- **Reserved:** Configure to 0x0.

10.1.5 Register List

| Module Name | Base Address |
|-------------|--------------|
| CE_NS | 0x03040000 |

| Register Name | Offset | Description |
|---------------|--------|----------------------------|
| CE_TDA | 0x0000 | Task Descriptor Address |
| CE_ICR | 0x0008 | Interrupt Control Register |
| CE_ISR | 0x000C | Interrupt Status Register |
| CE_TLR | 0x0010 | Task Load Register |
| CE_TSR | 0x0014 | Task Status Register |
| CE_ESR | 0x0018 | Error Status Register |

| Register Name | Offset | Description |
|---------------|--------|---------------------------------|
| CE_CSA | 0x0024 | DMA Current Source Address |
| CE_CDA | 0x0028 | DMA Current Destination Address |
| CE_TPR | 0x002C | Throughput Register |

10.1.6 Register Description

10.1.6.1 0x0000 CE Task Descriptor Address Register (Default Value: 0x0000_0000)

| Offset: 0x0000 | | | Register Name: CE_TDA |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/W | 0x0 | Task Descriptor Address Configure as the first address of the descriptor structure. |

10.1.6.2 0x0008 CE Interrupt Control Register (Default Value: 0x0000_0000)

| Offset: 0x0008 | | | Register Name: CE_ICR |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:4 | / | / | / |
| 3:0 | R/W | 0x0 | Task Channel3–0 Interrupt Enable 0: Disable 1: Enable |

10.1.6.3 0x000C CE Interrupt Status Register (Default Value: 0x0000_0000)

| Offset: 0x000C | | | Register Name: CE_ISR |
|----------------|------------|-------------|-----------------------|
| Bit | Read/Write | Default/Hex | Description |
| 31:4 | / | / | / |

| Offset: 0x000C | | | Register Name: CE_ISR |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 3:0 | R/W1C | 0x0 | <p>Task Channel3–0 End Pending</p> <p>0: Not finished</p> <p>1: Finished</p> <p>It indicates whether task is completed.</p> <p>Write the corresponding channel bit of the register to clear the end flag.</p> <p>When the last task in the task chain ends, the operation of the task chain will end normally. If the task fails in the middle, the task chain will be aborted. The CE_ISR register will be automatically updated when it ends normally or aborts abnormally. And it is determined whether to generate an interrupt signal according to the IE configuration (bit31) of Common Control when the current task ends or aborts.</p> <p>If using interrupt, after receiving the interrupt, read the corresponding channel bit of CE_ISR to judge whether it ends successfully or stops failure.</p> <p>If not using interrupt, the CE_ISR status register can be continuously queried for the channel bit until the successful end flag is set or the failure stop flag is set. Write the corresponding channel bit of the register to clear the end flag.</p> <p>If it fails to stop, you can read the error code on the channel corresponding to the CE_ESR register.</p> |

10.1.6.4 0x0010 CE Task Load Register (Default Value: 0x0000_0000)

| Offset: 0x0010 | | | Register Name: CE_TLR |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:1 | / | / | / |
| 0 | R/W | 0x0 | <p>Task Load</p> <p>When set, the CE can load the descriptor of task if the task FIFO is not full.</p> |

10.1.6.5 0x0014 CE Task Status Register (Default Value: 0x0000_0000)

| Offset: 0x0014 | | | Register Name: CE_TSR |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:2 | / | / | / |
| 1:0 | R | 0x0 | Running Channel Number 00: Task channel0 01: Task channel1 10: Task channel2 11: Task channel3 |

10.1.6.6 0x0018 CE Error Status Register (Default Value: 0x0000_0000)

| Offset: 0x0018 | | | Register Name: CE_ESR |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:16 | / | / | / |
| 15:12 | R/W1C | 0x0 | Task Channel3 Error Type xxx1: Algorithm not support xx1x: Data length error x1xx: keysram access error for AES 1xxx: Reserved |
| 11:8 | R/W1C | 0x0 | Task Channel2 Error Type xxx1: Algorithm not support xx1x: Data length error x1xx: keysram access error for AES 1xxx: Reserved |
| 7:4 | R/W1C | 0x0 | Task Channel1 Error Type xxx1: Algorithm not support xx1x: Data length error x1xx: keysram access error for AES 1xxx: Reserved |
| 3:0 | R/W1C | 0x0 | Task Channel0 Error Type xxx1: Algorithm not support xx1x: Data length error x1xx: keysram access error for AES 1xxx: Reserved |

10.1.6.7 0x0024 CE Current Source Address Register (Default Value: 0x0000_0000)

| Offset: 0x0024 | | | Register Name: CE_CSA |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | CUR_SRC_ADDR Current source address |

10.1.6.8 0x0028 CE Current Destination Address Register (Default Value: 0x0000_0000)

| Offset: 0x0028 | | | Register Name: CE_CDA |
|----------------|------------|-------------|---|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R | 0x0 | CUR_DST_ADDR Current destination address |

10.1.6.9 0x002C CE Throughput Register (Default Value: 0x0000_0000)

| Offset: 0x002C | | | Register Name: CE_TPR |
|----------------|------------|-------------|--|
| Bit | Read/Write | Default/Hex | Description |
| 31:0 | R/WC | 0x0 | TP_NUM It indicates the throughput writing to this register at last time. Writing to this register will clear it to 0. |

10.2 Security ID

The Security ID (SID) is used to program and read keys which include chip ID, thermal sensor, HASH code, and so on.

The SID module has the following features:

- 2 Kbits electrical fuse (eFuse)
- Backup eFuse information by using SID_SRAM
- A fuse only can program one time
- Burning the key to the SID
- Reading the key use status in the SID
- Loading the key to the CE

Before performing the burning operation, ensure that the power supply of the eFuse power pin is stable. After the burning operation is completed, cancel the power supply of the eFuse power pin.

Appendix: Glossary

The following table contains acronyms and abbreviations used in this document.

| Term | Meaning |
|----------|---|
| A | |
| ADC | Analog-to-Digital Converter |
| AE | Automatic Exposure |
| AEC | Audio Echo Cancellation |
| AES | Advanced Encryption Standard |
| AF | Automatic Focus |
| AGC | Automatic Gain Control |
| AHB | AMBA High-Speed Bus |
| ALC | Automatic Level Control |
| ANR | Active Noise Reduction |
| APB | Advanced Peripheral Bus |
| ARM | Advanced RISC Machine |
| AVS | Audio Video Synchronization |
| AWB | Automatic White Balance |
| B | |
| BROM | Boot ROM |
| C | |
| CIR | Consumer Infrared |
| CMOS | Complementary Metal-Oxide Semiconductor |
| CP15 | Coprocessor 15 |
| CPU | Central Processing Unit |
| CRC | Cyclic Redundancy Check |
| CSI | Camera Serial Interface |
| CVBS | Composite Video Broadcast Signal |
| D | |
| DDR | Double Data Rate |
| DES | Data Encryption Standard |
| DLL | Delay-Locked Loop |
| DMA | Direct Memory Access |
| DRC | Dynamic Range Compression |
| DVFS | Dynamic Voltage and Frequency Scaling |
| E | |
| ECC | Error Correction Code |
| eFuse | Electrical Fuse, A one-time programmable memory |
| EHCI | Enhanced Host Controller Interface |
| eMMC | Embedded Multi-Media Card |
| ESD | Electrostatic Discharge |
| F | |
| FBGA | Fine Pitch Ball Grid Array |

| Term | Meaning |
|----------|---|
| FEL | Fireware Exchange Launch |
| FIFO | First In First Out |
| G | |
| GPIO | General Purpose Input Output |
| I | |
| I2C | Inter Integrated Circuit |
| I2S | Inter IC Sound |
| ISP | Image Signal Processor |
| J | |
| JEDEC | Joint Electron Device Engineering Council |
| JPEG | Joint Photographic Experts Group |
| JTAG | Joint Test Action Group |
| L | |
| LCD | Liquid-Crystal Display |
| LFBGA | Low Profile Fine Pitch Ball Grid Array |
| LRADC | Low Rate Analog to Digital Converter |
| LSB | Least Significant Bit |
| LVDS | Low Voltage Differential Signaling |
| M | |
| MAC | Media Access Control |
| MIC | Microphone |
| MIPI | Mobile Industry Processor Interface |
| MLC | Multi-Level Cell |
| MMC | Multimedia Card |
| MPEG | Motion Pictures Expert Group |
| MSB | Most Significant Bit |
| N | |
| N/A | Not Application |
| NMI | Non Maskable Interrupt |
| NTSC | National Television Standards Committee |
| NVM | Non Volatile Storage Medium |
| O | |
| OHCI | Open Host Controller Interface |
| OTP | One Time Programmable |
| OWA | One Wire Audio |
| P | |
| PAL | Phase Alternating Line |
| PCM | Pulse Code Modulation |
| PHY | Physical Layer Controller |
| PID | Packet Identifier |
| PLIC | Platform-level Interrupt Controller |
| PLL | Phase-Locked Loop |
| POR | Power-On Reset |

| Term | Meaning |
|----------|---|
| PRCM | Power Reset Clock Management |
| PWM | Pulse Width Modulation |
| R | |
| R | Read only/non-Write |
| RGB | Read Green Blue |
| RGMII | Reduced Gigabit Media Independent Interface |
| RMII | Reduced Media Independent Interface |
| ROM | Read Only Memory |
| RSA | Rivest-Shamir-Adleman |
| RTC | Real Time Clock |
| S | |
| SAR | Successive Approximation Register |
| SD | Secure Digital |
| SDIO | Secure Digital Input Output |
| SDK | Software Development Kit |
| SDRAM | Synchronous Dynamic Random Access Memory |
| SDXC | Secure Digital Extended Capacity |
| SLC | Single-Level Cell |
| SoC | System on Chip |
| SPI | Serial Peripheral Interface |
| SRAM | Static Random Access Memory |
| T | |
| TDES | Triple Data Encryption Standard |
| TWI | Two Wire Interface |
| U | |
| UART | Universal Asynchronous Receiver Transmitter |
| UDF | Undefined |
| USB DRD | Universal Serial Bus Dual Role Device |
| UTMI | USB2.0 Transceiver Macrocell Interface |
